THE AEROPLANE

VOL. XVII. No. 1.

The Editorial and Advertising Offices of "The Aeroplane" are at 166, Piccadilly, Lond n, W.1.
Telegraphic Address: "Aileron, London." Telephone: Mayfair, 5407.
Accounts, and all correspondence relating thereto, should be sent to the Registered Offices of The Aeroplane and General Publishing Co., Ltd., Union Bank Chambers, 61, Carey Street, London, W.C.2
Subscription Rates, post free: Home, 3 months, 7s. 6d.; 6 months, 15s.; 12 months, 30s.
Foreign, 3 months, 8s. 9d.; 6 months, 17s. 6d.; 12 months, 35s. Canada, 1 Year, $8.
U.S.A., 1 Year, $8.50c.

ON PEACE.

For nearly five years our Press and our politicians have been proclaiming to the world at large and to the people of this country in particular that the signature of any German on a scrap of paper is worthless.

On Saturday, June 28th, the representatives of the German people signed a scrap of paper, and forthwith threw the Allied Nations and the United States into paroxysms of joy—if the newspapers of the world are to be believed.

One is not and never has been a believer in Universal Peace, whether produced by treaty, or by an upsetting of the balance of power by a League of Nations, or by the regeneration of the human race. Nor is one a believer in peace between temporary Allies any more than eternal enmity between temporary enemies.

We are but little nearer, in the passing of eternity, to permanent or universal peace now than we were in 1914, or in 1814, or in 1014, or in the year 14 B.C.

The soundest policy as a preservative of peace is to obey the motto "In time of peace prepare for war." Only by readiness for war can peace be maintained.

In the recent war we saw the beginning of aerial warfare and realised a little the value of Air Power. In the next war we shall see aerial warfare properly developed, and aircraft put to their logical uses.

This nation and this Empire is more vulnerable to attack by aircraft than by any other weapon, it is better fitted to use aircraft as a weapon of offence than any other weapon, and it must rely more than any other nation in future wars on the efficiency of its anti-aircraft defences.

Thus it behoves us as a people to prepare forthwith to set up such an Air Force and such a system of defence against aircraft as will insure us for all time against invasion, and against interference in our communications with the British Dominions Overseas, and such as will enable us to strike at once by way of the air against any nation which has the presumption to disturb our peace.

Our politicians will hamper the setting up of such an Air Force, and the people will not heed the lesson of this war. For this reason those who have eyes to see and minds to understand have upon them henceforth the burden of working for a big Air Force as those of an earlier generation had the task of working for a big Navy.

Let us, therefore, to whom aircraft and all that the word implies are the first of our interests, dedicate ourselves to the task of maintaining the Air Power of this Kingdom.—C. G. G.

ON A TERRITORIAL AIR FORCE.

Speaking at the Independent Force, R.A.F., dinner recently General Trenchard stated that a Territorial Force scheme for the R.A.F. is under consideration. He gave no indication whatever of the lines on which the scheme is to be worked, but the natural assumption is that it will be more or less based on the Territorial Force scheme of the Army as organised by the Viscount Haldane.

Whatever may be the popular opinion of Lord Haldane, as gathered from the common news-sheets, the indisputable fact remains that his Territorial scheme was remarkably good, and that it played a very important part in such success as the British Army achieved in this war. Lord Haldane is recognised by experienced officers of the General Staff as one of the best War Ministers whom this country has had for several generations. It is true that he was weak in his faith in aviation and that the R.F.C. owed him no thanks for anything, but it is none the less a fact that he did much for the British Army, and that it was largely due to him that the little British Expeditionary Force at the beginning of the war was the most efficient army in the world.

The Chief Problem.

Lord Haldane's task before the war was very similar to that which confronts Sir Hugh Trenchard after the war. When one regards the situations side by side one finds that in each case there is the primary obstacle of a Government whose first consideration is to maintain itself in office by pandering to the mob. The people must be placated by the old bribes of *panem et circenses*. They must have cheap food and cheap amusements (one can hardly call the entertainment tax a hindrance). There is very little money to spare for the defence of the country. With the exception of a few intelligent people, the population of the country believes that it is in for a prolonged period of the deepest peace.

There is, then, the choice between a very small permanent force of the very highest efficiency, plus as large a volunteer force as can be raised, and a badly-paid, badly-equipped professional force of larger size, without any volunteer backing. The problem to be faced is simply how to spend to the best advantage the small amount of money which can be extracted from a Government which is much more concerned about its own immediate present than about the future of the Empire.

Lord Haldane chose to spend the bulk of his money on building the B.E.F., and his policy was wholly justified in the first six weeks of the war. His Territorial scheme was equally well justified in the next six months, when the semi-trained Territorial battalions were pitchforked into the line to hold up the German advance until the first of the Kitchener Armies began to arrive.

The End of the Parallel.

But when one comes to consider the relative difficulties of the two tasks of raising a Territorial Army and of raising a Territorial Air Force—given equal official support and equally good staff work in each case—the parallel ends abruptly. In fact there can be no comparison.

452844

Consider, for example, what inducement can be offered to join a Territorial infantry battalion. A man must join from one of three motives. Either he must be a whole-souled patriot who thinks it his duty to learn to defend his country—in which case he is qualified for a place in a museum. Or he likes soldiering for soldiering's sake, but cannot afford to be a professional soldier—which probably accounts for the bulk of the Territorial Force. Or he likes the idea of swanking around in a uniform on occasion—which also accounted for a large number of "Terriers" before the war.

All he gets for his trouble is a holiday in the country for a week or so once a year—and generally a very wet and uncomfortable holiday. For it he has to sacrifice his spare time on four or five days every month. He has to tramp down to an ugly drill-hall, generally in a slum. And he has to do uninteresting drills and marches which seem to lead nowhere in particular and back again. After which his friends and acquaintances jeer at him for "playing at soldiers."

Air Force Inducements.

Consider, as against all that, the inducements which can be held out by the Air Ministry to persuade people to join a Territorial Air Force, if it is run on the right lines.

In the first place, pilots who have left the R.A.F. and who cannot afford to fly at their own expense can go on flying at intervals for years. Not only will they keep in training, but they will keep in touch with the latest aeronautical developments.

One knows for certain that this inducement alone would bring dozens of present pilots into the Territorial Air Force, and probably it would bring thousands into it, if there were room for them. Also in years to come it would induce many thousands of youngsters to join, because every boy at school to-day wants to fly, just as the previous generation wanted to drive a motor-car and as the older generation wanted to drive a railway-engine or even a traction-engine.

That craving to be an engine-driver is one of the universal desires of youth which continues from generation to generation and survives into the old age of the individual. And it can be made a very valuable national asset if it is handled the right way.

Territorial or Temporary.

Furthermore, many an ex-pilot of the R.A.F., and many an observer for that matter, would rather join a Territorial Air Force than take a Temporary Commission in the R.A.F. As Captain Barron has pointed out in his article on the reorganisation of the R.A.F., the Temporary Commission scheme may only appeal to a very limited number of people, because many will regard it as a "dead-end occupation." A Territorial Air Force does at any rate afford present-day pilots and observers a chance of keeping in the closest touch with their old Service and of keeping thoroughly up-to-date in aeronautical affairs while continuing to make a decent living at their normal professions.

Inducements to Airmen.

Apart from officers and airmen-pilots, a Territorial Air Force offers strong inducements to ex-airmen of the R.A.F. and to ordinary mechanics all over the country, as well as to youths of the higher social classes who cannot hope to fly owing to physical defects.

One of the greatest harms done to this country in the early days of the war was the calling-up of skilled mechanics who were Territorial soldiers. They went into the line as infantry and were killed in hundreds. Many thousands more joined the Kitchener Armies as privates and were likewise killed, or maimed so as to be unfit for work.

Now, if all the former air-mechanics of the R.A.F., and a number of other skilled mechanics from engineering works, garages, and so forth, all over the country, could be induced to join a Territorial Air Force, not only would the R.A.F. be thoroughly adequately manned in time of war, but these particularly valuable men would be saved for the reconstruction of industry after the war. One believes firmly that if all those thousands of gallant and patriotic mechanics and engineers who were killed during the first year of the war were still alive, the outlook for British Industry would be far brighter than it is to-day, for they would stand none of the Bolshevist nonsense and treason which is talked in our factories by the trench-dodging scum who, unhappily, form so large a proportion of our surviving industrial population.

An additional inducement to mechanics and engineers to join a Territorial Air Force is the fact that they would thus learn a great deal about the construction of aircraft and aero-engines, or—in the case of those who have already worked on aircraft—would keep their knowledge up to date, and so would be ready to take important jobs in the Aircraft Industry when the great boom in Civil Aviation arrives, as it will do some day—though none can say whether it will be in two, five, fifteen, or twenty-five years' time.

Inducements to Youths.

Similarly, youngsters now at school would find it worth their while to join as airmen, because, in case of war, they would automatically drop into their places in the mobilised R.A.F. Those who were fitted for the job would certainly be promoted at once to be technical officers, if they were unfit to become pilots. Many would be taught to fly. All the rest would be kept at a job at which they were already more or less proficient.

An attempt is being made already in a very small way—as already noted in this paper—to induce youngsters between 14 and 20 years of age to join a branch of a London Territorial Battalion and learn something of aeronautical engineering as taught by ex-R.A.F. officers. This is a step in the right direction—or perhaps one should rather describe it as an attempt at toddling in the right direction—but, obviously, although it has had the official blessing of General Trenchard, it is wrong in principle, as the steps of toddlers generally are.

In the first place, if the R.A.F. is to be the R.A.F. and is not to be a part of the Army, it is quite wrong that aeronautics should be taught under the auspices of a T.F. Battalion of the Army. In the second place, any instruction of this sort, if it is to be given at all, should be given at an R.A.F. station of some sort—for preference in an aeroplance shed at an aerodrome among actual aeroplanes. There are plenty to spare at Hendon and Hounslow and elsewhere. Or the classes might be held at the Agricultural Hall or one of the other numerous R.A.F. stores in London itself. However, doubtless this small matter will be put right when a proper cut-and-dried Territorial Scheme is laid down by the Air Ministry.

An Ancient Idea.

So far one has merely indicated roughly how much easier it will be to induce people to join a Territorial Air Force than it can be to get recruits for the Territorial Army. There are many other inducements, but one has neither the time nor the space in which to set them forth. They may be left to the recruiting offices of the R.A.F. (T.F.) whenever they may be established.

Actually the idea of a Territorial Air Force is far from new. In April and May of 1914 Mr. W. E. de B. Whittaker, now Major, General Staff, wrote a series of articles in this paper on "A Reserve for the Royal Flying Corps" and on "Local Training," setting forth with his customary lucidity and peculiar humour the difficulties

and also the great possibilities of a Territorial scheme for the R.F.C. As he rightly argued, in those days pilots were so few and far between that there was little possibilty of raising the personnel of a squadron in any one town, or of establishing an aerodrome, or of raising the money to buy machines—despite the sporting offer of the city of Liverpool to raise and equip a volunteer squadron.

Many points in his article published on May 7th, 1914, might well be of value to-day to those who may be concerned with drafting the new Territorial scheme. And as to the general effect of a Territorial Air Force the end of the said article may well speak for itself :—

"This spreading of aviation (Territorial) into the most curious nooks of the Kingdom, to places where business is the only god, would do much to popularise aviation among the people. Familiarity with flying would teach the populace many lessons both as to the safety of aeroplanes and the instability of aviators. When a man does not understand a thing he invariably dislikes it.

"It (Territorial aviation) might have some strange effect on patriotic feeling. To see a part of the country's defences flying over one's back garden is a noble sight calculated to rouse the finest instincts in man. So long as the local aviator preserved a judicious attitude as to miscellaneous landings, there is no reason why he should not become as popular as the local mayor when he wears his triumphal collar."

Value for Money.

To-day the position is very different in many ways, and a Territorial Air Force would give the Nation very much better value for its money than it could do in the days in which Mr. Whittaker introduced the Territorial idea.

We have now enough trained pilots and mechanics in any really big town to supply the whole personnel of a squadron, and some cities could raise a couple of squadrons. This trained personnel could easily train new people as they might come along in the future. We have aerodromes to spare all over the country, with huts and sheds for more squadrons than any Territorial scheme is likely to raise. Also we have machines, literally as well as figuratively, to burn—if certain "Questions in the House" may be taken as reasonably accurate statements. The country would get better value out of those machines by handing them over to volunteer squadrons than ever it is likely to get by "reduction to produce" for the sake of giving employment to unskilled labour and officials of the Salvage Department.

The Finance Question.

Thus one sees that a vast Territorial Air Force can be raised and equipped practically without asking the Treasury for a penny, merely by using matériel which already exists, and for which the Treasury has already paid, or for which it will have to pay sooner or later.

The personnel will cost nothing, except for uniforms—of which there is probably an excess as great as the excess of machines and engines. Only when called out for manœuvres will there be any pay and maintenance to consider, for all the other work of the squadrons will be done locally, in the spare time of the personnel.

So far as one can see, the only regular and constant expenditure would be on petrol and oil, and this, though representing perhaps a fairly large sum in the year, would actually be very small in proportion to the value received, and should be regarded as a National Insurance premium against future aerial invasion. Also, perhaps some of the Petrol Profiteers might help with gifts of fuel.

The Air Ministry's Choice.

To put the position briefly, the Air Ministry has the choice of two distinct policies. Given that it will have a limited grant from the Treasury, that sum can be spent in either of two ways :—

(A) It can all be spent on a Regular Air Force—consisting of officers with permanent, temporary, and special

HYDE PARK CORNER.—Photographed on Alexandra Rose Day from the red-nosed Handley Page bouquet-dropper

reserve commissions, and airmen under a permanent engagement, plus a liability to service in the reserve.

(B) It can have a much smaller Regular Air Force, with a very large Territorial Air Force attached.

In the first case most of its Vote will be spent in pay and allowances, and there will be little left for matériel. Which means that when war breaks out again it will find itself precisely where it was when this war began—namely, with a small but highly efficient force, but without aeroplanes or engines, without an Aircraft Industry capable of supplying its war needs, without a large trained personnel, and without means of sudden expansion.

In the second case it will be able to spend most of its money on matériel, because it will be able to get its personnel for nothing or next to nothing. Thus in case of war it would have a fairly healthy Aircraft Industry capable of expanding its output rapidly to equip the Territorial squadrons with the latest machines and engines.

It must be one or the other. The money may be spent mostly on men, or mostly on machines. It is certain that no post-bellum Government will dare to provide enough money to maintain a Regular Air Force adequate to our needs. Therefore it seems fairly self-evident that the only hope of maintaining our position as the leading Power in the air is to spend as much as possible on equipment and as little as possible on personnel.

Permanent Pay.

At the same time it is essential that those people who *are* paid by the Air Ministry—namely, the Regular officers and airmen—should be very highly-paid specialists, for on them will depend the degree of excellence and efficiency attained by the personnel of the Territorial Air Force.

General Trenchard has stated definitely that officers of the R.A.F. will be able to live, and live well, on their pay, so there need be no anxiety on that score. It will be far better to pay a small number of highly efficient people really well, and to have a large number of volunteers who will be paid nothing at all, than to have a medium number of people all badly paid, all without enthusiasm for their work, and all as inefficient at their jobs as was the average Technical Expert during the war.

Inducements to the Authorities.

Thus one sees that just as there is every inducement for the man who is keen on aviation to join the R.A.F. (T.F.), so there is every inducement for the Authorities, whether at the Air Ministry or in the Cabinet, to form an R.A.F. (T.F.). Correspondence, some of which has been published in this paper, shows how keen many people, both those formerly in the R.A.F. and others, are to join a Territorial Air Force. It is a newspaper axiom that for one person who writes a letter to a paper on a given subject there are 100 who intended to do so, or would like to do so, but don't. One only hopes that the Authorities are as keen on forming it, and that they will set forth their scheme, whatever it may be, before people have become bored waiting for it.—C. G. G.

ON THE RE-ORGANISATION OF THE R.A.F.

It has always been the custom in this paper to give all sides of every question a fair hearing, no matter how much the other sides might disagree with the editor's personal opinions. If, on occasion, the editorial opinion has predominated, it has only been because the opposition has not had the pluck or the ability to voice its arguments in print, or, one admits it freely, because the opposition has not thought it worth while. The history of aeronautics, especially of Service aeronautics, in the past six or seven years has proved the folly of the last-mentioned course of inaction, for unfortunately, from the opposition point of view, it has always been shown in the end that this paper has been right. Not that one takes any personal credit for the fact, for the fairly consistent rightness of The Aeroplane has simply been due to backing the opinions of the right people.

Because of this principle of giving all sides a fair hearing one has given full publicity to the letter of one "Audax" last week, and to a more elaborate argument in the form of an article by Captain Barron this week. Both these officers disagree with, or at any rate mistrust, the scheme for the reorganisation of the R.A.F. as disclosed in outline by the Chief of the Air Staff recently.

One's personal opinion is that the scheme will work out quite well in practice, though possibly modifications may be necessary in detail in the light of experience during the next few years. Moreover, it must be remembered that all we know at the moment is simply the outline, or perhaps one should say the skeleton, of the scheme. One could scarcely judge the beauty of Cleopatra or the strength of Milo of Crotona or the genius of Cæsar from a casual glance at their skeletons in a museum.

Those who have served under Sir Hugh Trenchard know his genius for handling the personnel of a fighting force, and those who have not had that privilege, but have merely watched the work of the R.F.C. under his guidance, have the fullest confidence in his ability to make good under difficult circumstances. Therefore there seems no reason to doubt the ultimate success of the R.A.F. scheme, so long as General Trenchard is allowed to work it out in his own way. One believes that the Secretary of State for Air, Mr. Winston Churchill, has that same faith in General Trenchard as have those who have served with him, and Mr. Churchill's own brilliant brain is certain to contribute ideas of great value to the scheme as it develops in practice.

It is an axiom that the ideal form of government is a benevolent despotism, and of all the King's Services the Royal Air Force more than any other has need of a benevolent despot to set it in order. The re-organisation of the R.A.F. is essentially a one-man business. When it has developed into a going concern, then perhaps it may be able to carry on with a Committee or a Board of Directors, or a Soviet, or something equally comic which the passing of time and the demands of the period may call into being. Meantime one is prepared to back the present scheme, of which, as already mentioned, we only know the skeleton.

The Blind-Alley Scare.

Captain Barron seems unintentionally to have given the answer to all critics of the scheme when he says that, like Wagner's music, it must be better than it sounds. If the scheme is as much better than all other schemes as Wagner's music is better than all other music, it will be far better than the R.A.F. deserves. If it is as the "Kaisermarch" is to "Pomp and Circumstance," or as "Parsifal" is to "Gerontius," then the R.A.F. will be the finest thing of its kind in the world—as it is now, for that matter, despite all its faults. Those who curse the R.A.F. and all its works ought to hear a few of the things that the people in the French and Italian and American flying services say about their own shows.

The thing that seems most to scare people about the new scheme is the notion that temporary commissions in the R.A.F. are simply a blind-alley occupation. So is any other occupation, as a matter of fact, if it does not happen to be the particular occupation for which the individual is best fitted. A man may study for the Bar,

and never get any further than the long one at the Trocadero. Or he may be articled as a chartered accountant and yet never be of any account whatever. Or he may be articled as a solicitor and end by soliciting alms. Or he may walk the hospitals with intent to become a doctor, and end by walking the streets full of dope. A man can only succeed in a job for which he is fitted by constitution. Education alone can never make him a success. The prizes in any competition are very few in proportion to the competitors, and the majority of the population of any country are the "also rans."

Temporary or Permanent.

Similarly a man's success as an R.A.F. officer will depend on his fitness for success and not on whether he starts with a permanent or a temporary commission. General Trenchard stated quite plainly that each year a certain number of temporary officers will be given permanent commissions. And, though he did not say so, it must be evident in the nature of things that every year a certain number of officers with permanent commissions will resign, or will be compelled to resign under pressure by their brother officers, or will be invalided out, or will be killed. So one class balances up against the other.

Thus one sees that, for a start, the temporary officer, if he is superlatively good all round, has a fair sporting chance of becoming a permanent officer. And, if a man has faith in his own ability, he need not hesitate to take a temporary commission, for if he proves good enough he is certain to get either one of the permanent commissions which are to be reserved for temporary officers or one of those vacated by a permanent officer who has fallen out by the way.

A Means to an End.

Furthermore, a temporary commission in the R.A.F. may well be regarded as a means to an end in civil aviation. Presumably most of us who are concerned with aviation to-day believe that civil aviation has a great future. Otherwise, to put it in the vernacular, we should not be such mugs as to stop in it.

But, civil aviation is still very much in its infancy. In fact, to judge by the way it is squealing at the moment, it is suffering badly from infantile colic, or at any rate from teething troubles. And small blame to it, for candidly one does not think a whole lot of the way its wet-nurses in the Department of Civil Aviation are treating the poor little beast.

Nevertheless, in two or three or at any rate in five years' time Civil Aviation will be a really sound business, and those people who are now quitting aviation in disgust or in despair will be sorry that they did so. Civil aviation is merely suffering to-day from a slump after the unnatural boom caused by the war, but the growth of all industries shows that the base of any slump is higher on the chart than the peak of the last boom but one, so there is no cause for worry, but merely for caution.

As a matter of fact, a slump is a very healthy thing, for it weeds out the unfit. Those who lack faith, or lack ability, get out and leave more room for those who remain. The Air Force and the Aircraft Industry alike are better without them. Those who remain in the R.A.F. with temporary commissions are in fact simply using a means to an end.

Luck and Judgment.

The temporary officer demonstrates his faith in aviation by taking a temporary commission. If he is superlatively good, and if he also has the necessary luck—for luck plays an important part in all successful careers—he will become a permanent officer and will in time rise to a high command. If he has not the luck, but merely has good judgment, he will learn all he can during his years of temporary service and so will leave the R.A.F. full of all the latest knowledge of aeronautical theory and practice and will be fit to take a really good job in civil aviation. Meantime the people who get out now will have drifted into other occupations and will be out of date so far as aviation is concerned. One has said all this before, months and months ago, but it is just as well to say it again, for people who are feeling depressed are apt to forget precisely the things which ought most to cheer them and support their failing faith. Therefore one wants to impress on all present officers of the R.A.F. the fact that if they have the chance of a temporary commission they will do well to take it.

The greatest pity seems to be that so many youngsters of the right class are having their applications for temporary commissions turned down by incompetent wing and group commanders while a certain number of undesirables are being recommended by the same people. That is a matter of bad luck on one side and bad judgment on the other, but it cannot be helped.

Many a good man in the Navy and Army has had his career blasted by a bad mark put against his name in the Service records by a senior officer who has himself been cashiered at a later date. Such a stroke of bad luck is merely a man's fate, like being born blind, or losing a leg in a motor-bus accident. The good man is the man who rises superior to fate and carves a career for himself in a new direction.

"Throw-outs."

One point raised by "Audax" deserves particular notice. He suggests that proved fighting pilots will be thrown out of the R.A.F. to make room for officers trained in an R.A.F. Sandhurst. The idea is entirely that of "Audax" himself. There is nothing in General Trenchard's speech to suggest it.

Personally one thinks that it might be for the good of the future R.A.F. to do so. Some of the best fighting men (in all the Services and not in the R.A.F. alone) are quite the worst officers and some are far from being gentlemen. A man may be a bully and a cad to his inferiors in rank, and yet be a first-class scrapper. Or a man may be a fine lone-hand fighter and yet hopeless as a patrol leader or an administrator. One of the bravest gentlemen whom one knew in the old R.F.C. was constitutionally unable "to command a corporal"—as a brother officer put it.

In the reorganised R.A.F. the permanent officers must combine all the qualities desirable in an officer and a gentleman. They must have bravery, but they must also have brains. And it is possible that some of the youngsters who will come out of an R.A.F. Sandhurst three or four years hence may combine the two qualities better than some of those who have distinguished themselves as fighting pilots. There is no room in a fighting service for Trade Union principles. Payment by results is the only possible method of securing efficiency. And promotion by merit is only piece-work under another name.

Equal opportunity for all is a perfectly sound theory, but a man must be fit to take his opportunity when it offers. If a proved fighting pilot cannot administrate a flight or a squadron properly when he reaches the end of the period of his temporary commission, then he must get out and make way for somebody who can. That is only Nature's law of the survival of the fittest.

Again it is a matter of a man's faith in his own ability. If the proved fighting pilot, with all his war experience of how a squadron ought to be run, and of how men ought to be handled, is not prepared to back himself against the product of an R.A.F. Sandhurst, then the sooner he gets out of the Air Force the better for himself and everybody else.

To those of faint heart one would merely point out that General Sir William Robertson, G.O.C.-in-C. the Army of the Rhine, lately C.-in-C. Forces in Great Britain, and formerly Chief of the Imperial General Staff, rose to the highest possible posts in the King's Army after having served for eleven years in the ranks before becoming a commissioned officer. Let his career be an example and an encouragement to those who find their prospects in the R.A.F. perhaps a little discouraging. To all such one counsels faith in the King's Service, faith in the Royal Air Force, faith in their Chief, and faith in themselves.—C. G. G.

AERIAL DEFENCE.

It is a time-honoured British custom to delay preparations for war until hostilities have begun. Then it is true that every effort is made to supply the deficiencies in men and material. But the necessary delay is the cause of the initial failures and heavy casualties which have marked the opening of every great war in which the British have been engaged. But there is yet a greater failing in the military policy of the English as laid down by the politicians. Inadequate preparations at the beginning of a war are invariably succeeded at the end by a relaxation of all precautions and a reduction of all systems of defence below a margin which would give adequate insurance against calamity in the future.

There is no indication that a similar policy will not be adopted once again now that official peace has been attained. There is a general impression amongst the public that the great nations of the world are so weary and impoverished that further trouble is impossible for years. It is possible that war may cease to be an amusement for a period of years, but it should not be forgotten that there are forces in national character which are stronger than weariness, and that a general impoverishment of nations does not necessarily prevent hostilities. Bankruptcy of a nation, as of a man, is often provocative of a recklessness which has little regard for consequences and gambles the national fortunes on the riskiest of stakes.

Major-General Ashmore, G.O.C. London Air Defence Area, in a speech delivered on June 23rd at the unveiling of a memorial to children of a Poplar school killed in an air raid in June, 1917, said :—

"For the moment there is no possibility of air raids. But what of the future? Can we say, 'It is peace. We need no more air defences'? With this object-lesson before us in Poplar, I do not think we can ever be content that London should be defenceless again.

"Commercial machines can all carry bombs. We have just seen an exhibition of the long ranges of modern machines. London is a very large, very important, a very easy target to find. The mere threat of an air raid would have a serious effect if there were no efficient defences. Efficient defences are a great deterrent, as we have seen. If they exist we may never be attacked. If they do not exist it is certain that an attack will be successful."

Aerial defence is a new branch in the science of war. It has been born and has grown during the past four years of war, and it is still in its infancy. Until the Armistice removed for a space the threat of enemy aerial action a continual series of notable improvements both in organisation and in the design and employment of the weapons of defence were carried into effect. The increase of experience and the enthusiasm of all ranks accelerated progress in these matters with remarkable effect. Is this all to cease?

Each war in the future will begin with an aerial attack by the aggressive Power on the nerve centres of its selected opponents in the hopes that an initial blow of great severity may give an easily-gained victory, or, if Fortune is not smiling, that the attack will interfere materially with the intricate process of mobilisation. No nation therefore can safely organise its aerial defences in peace-time along the same lines as are adopted in the case of other units in the military forces of the Crown. It will not be possible to wait until mobilisation is completed for the aerial defence services to become effective. It is essential that they should be maintained on a war establishment at all times, if the national safety is to be considered at all.

But there is another reason why it is advisable to maintain an adequate establishment. The importance of aerial defence will increase vastly in the future, and its sphere of action will extend as the capabilities of aircraft grow. Unless the system is kept in a state of vitality the improvements and developments in the future will be small. The Headquarters Staff can organise and can develop systems of control, but it can hardly be expected to devise those detail improvements which mean so much in the production of efficiency. These are as a rule the outcome of experience in the daily routine of station life. Most inventions are labour-saving in origin, and they need the rigour of work for their existence.

During the past war the detail developments in work with guns, searchlights, sound locaters, and balloon aprons have been many, and the greater majority have been designed or produced as a result of the suggestions made by junior officers and the rank and file.

If a drastic reduction is made in the aerial defence establishments (peace) this productiveness will cease and the continuity of training will be broken. Those who did so well in this work during the war will be deflected to other paths and the keenness and enthusiasm which produced such good results will have faded into insignificance.

This country is at the moment subject to democratic rule. If democracy wishes to justify its claims to virtue and wisdom, it should impress on its chosen representatives the necessity of insisting on the importance of aerial defence in the future policy of the Government. If the people lack interest in the matter and prefer present parcimony to future safety, then indeed will it prove that autocracy has many things in its favour and that minorities are often possessed of wisdom.—H. F.

THE ROYAL AERONAUTICAL SOCIETY.

The jubilee of the Royal Aeronautical Society, which was founded in 1866, would have been celebrated in 1916, but for the late lamented war. However, a belated celebration was made the occasion for a very largely attended Garden Party, on Sunday afternoon, June 29th, at the Cricklewood Aerodrome, which was lent for the occasion by Messrs. Handley Page, Ltd.

The members and guests were received by the chairman (Major-General R. M. Ruck, C.B., C.M.G.), and the Council, in the running shed.

Messrs. Handley Page's works were thrown open to the inspection of the visitors during the whole afternoon, and a Handley Page machine was occupied for the greater part of the time in carrying passengers.

Commander T. Y. Baker, R.N., and Major L. N. G. Filon, D.Sc., F.R.S., R.A.F., gave a lecture, illustrated by lantern slides, on "Navigation on a trans-Atlantic Flight," which attracted a large audience, and an exhibit arranged by the Technical and Research Departments of the Air Ministry was a centre of attraction. This exhibit comprised a number of aero-engines of both Allied and enemy origin, wireless and photographic equipment, armament items, specimens of steel construction, and the like.

The band of the Royal Air Force discoursed more or less sweet music throughout the afternoon, and in addition the D.A.P. Quartette gave a concert in No. 1 shed.

Tea was served in the running shed—and it is to be hoped that the Society reaped a handsome profit therefrom—as the difference between the price charged therefor and the value received indicates that if they did not the contractors must have done so to excess.

"Fastest flying on record."

The winner of the Peace Aerial Derby at Hendon, Captain Gathe good, flying an Airco aeroplane fitted with Napier engine and

B.T H. Magnetos

completed the course of 190 miles in 87 minutes, and four seconds later Lt. Nisbet on a Martynside aeroplane with Rolls-Royce engine and B.T.H. Magnetos, came in second—the fastest flying on record in an Aerial Derby.

These performances add further records to B.T.H. Magnetos and support the high opinion in which they were held by pilots during the war for reliability in service.

ON EIGHT YEARS OF "THE AEROPLANE."

It seems worth while to record the fact that with this issue of THE AEROPLANE begins the ninth official year of its existence, and its seventeenth half-yearly volume. One takes this opportunity of thanking those numerous readers who have stood it for so long. We are a patient and long-suffering people, and nothing proves the fact better than that THE AEROPLANE should have survived for eight years without being either suppressed by the Authorities or wrecked by infuriated readers.

It is a curious coincidence that this number of the paper should also be the first published without direct connection with any impending or present war, though one refrains from the hypocrisy of calling it "Our First Peace Issue," as one might do if one wished to be popular or conventional. When THE AEROPLANE was first published at Midsummer, 1911, one of the chief motives for starting it was to free one's hands for a campaign in this country with the object of preparing for the war with Germany which everybody with any understanding knew was bound to break out before long.

From 1911 till August of 1914, we who were concerned with this paper fought and intrigued and argued and preached for preparedness for war in the air. From August, 1914, till the signing of the Armistice we continued to fight and intrigue for better equipment and better administration in the Flying Services. For their help in this work before the war one desires to thank Mr. P. K. Turner, Mr. W. E. de B. Whittaker, Mr. W. H. Sayers, and Mr. E. M. Rossiter, all of whom laboured strenuously with the same objects in view (though very different in their methods) while on the staff of this paper, and all of whom have served the King throughout the war. During the war itself one's sole male assistant was the late Mr. W. L. Wade, who, unfit for military service, lived only long enough to see the object of all his work achieved, namely the command of the air held undisputed by the King's Flying Services. To his memory one owes a deep debt of gratitude. One is also greatly indebted to Miss S. F. Benda for much valuable work, especially as concerns military aviation, during the past two years.

Now THE AEROPLANE is acquiring a larger staff, and one is glad to be able to say that all the male members of that staff have served in the R.A.F. The Assistant Editor is Captain P. A. Barron, formerly a Technical Officer at S.W. Area Headquarters, and his assistant is Mr. G. L. Dore, Lieut. R.A.F., a scout pilot who was wounded and crashed in France.

The Technical Editor is Captain W. H. Sayers, formerly of the Seaplane Department at the Air Ministry and previously Lieut. R.N.V.R. at the R.N.A.S. Experimental Station, Isle of Grain, where he designed and built the highly efficient P.V. seaplanes and the famous "Kitten." His assistant is Mr. Leonard Bridgman, lately a Technical Officer in the Midland Area, and previously an infantry soldier.

Captain Sayers is at present the only former member of the staff of THE AEROPLANE who has returned to the fold. But one has hopes of others. And if fortune continues to favour this paper it is one's intention to add to the staff, as may be necessary, entirely from the personnel of the Flying Services.

During its eight years of existence this paper has had its headquarters at 166, Piccadilly. These offices are now too small and inconvenient, so in a few days' time headquarters will be removed to 175, Piccadilly. Thus the lucky figure 13 will still be made up by the sum of the address. The new offices are exactly opposite the Burlington Arcade, and as they are on the first floor and are thus independent of the eccentricities of elevators, they will be more readily accessible to visitors—who will be as welcome as ever, whether hostile or friendly, or merely menacingly neutral.

The immediate task of THE AEROPLANE is to assist in making Civil Aviation into a sound business proposition. In doing so one foresees that one will be obliged to continue to practise the gentle art of making enemies. That is always a praiseworthy occupation, for the Scriptures enjoin upon us that we shall love our enemies. One endeavours to obey that injunction. In fact one loves one's enemies so much that one makes a hobby of collecting them.

The new members of the staff and the regular contributors to the paper promise well in the same direction, and, as they are already absorbing the basic principle that THE AEROPLANE is not run for the benefit of its readers but entirely for the amusement of the editorial staff, there is every prospect of the said readers being as adequately supplied with mental irritation in the future as in the past.

The ultimate task of THE AEROPLANE in the piping times of peace which are now before us is to prepare for war. For this reason the King's Services will always be the first consideration in the policy of the paper. Of this future war for which we have now to begin to prepare one proposes to write in a few days' time, for if one is to maintain a reputation as a prophet it is well to start early while the going is easy.—C. G. G.

THE RE-ORGANISATION OF THE R.A.F.

The following letter has been received:—

Sir,—In reply to a letter signed "Audax" in your issue of June 25th, it seems to me that there is something to be said for General Trenchard's scheme for asking officers to accept temporary commissions. "Audax" complains that a temporary commission of this kind would lead one who accepted it merely into a "blind alley." I suggest that there are many who would be prepared to serve for a total of four years; one year of which would be occupied in training, while during the other three years the officer will be in all respects on the same footing as regards pay, disablement pension, etc., as the regular R.A.F. officer. After four years he will get a gratuity of £300, and will have under the C.A.S.'s scheme a first-class technical education at the expense of the Government. As is well known, the range of technical subjects in the Air Force is a very wide one, and a special feature is to be made of educating holders of temporary commissions in the future.

"Audax" should remember also that the work in the future R.A.F. will not be anything like as exacting as the war flying in the past, and will leave therefore more time and more opportunities for specialising in one of the many branches referred to above.

With regard to this second question in which he asks "why fighting pilots should be chucked out of the Service to make room for officers trained in an R.A.F. Sandhurst?" it seems to have escaped his notice that, even if all pilots in the Service on November 11th, 1918, were retained, this supply would not last for ever, and that it would still be necessary to legislate for the future supply. This is what Sir Hugh Trenchard is attempting with his scheme for an R.A.F. Cadet School.

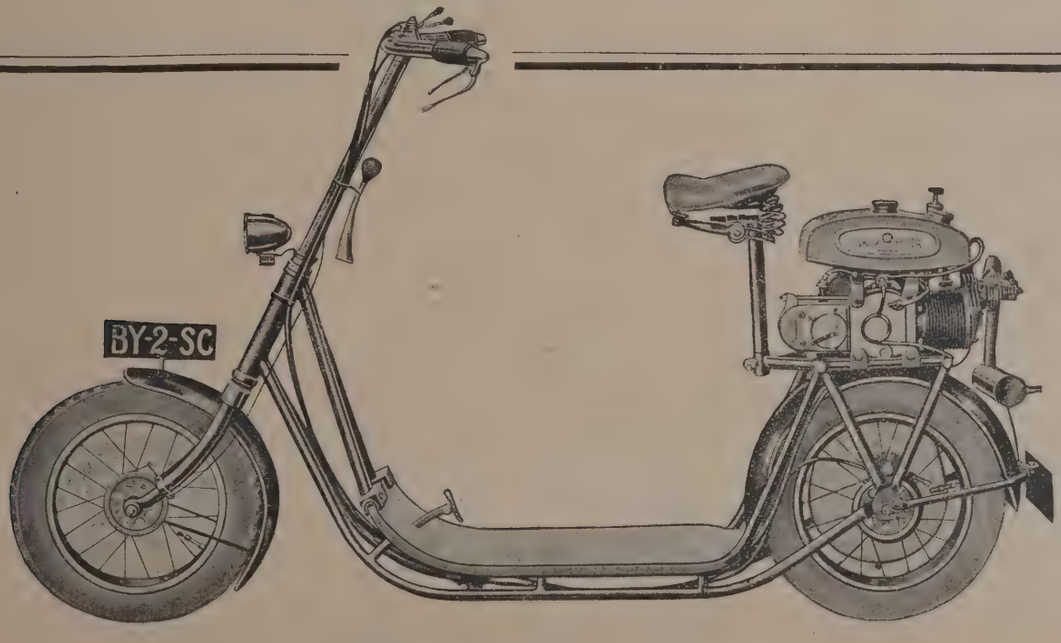
In his last paragraph "Audax" states that he considers a Territorial Air Force to be a sound idea. It is, I believe, the intention of the C.A.S. that officers who have held temporary commissions should form this Territorial or Special Reserve Force, and I hope very much that "Audax" is right when he says that it will attract the best of the proved fighting and civilian pilots. I myself predict a great future for a reserve force composed of officers with three or four years' experience either with the R.A.F. in the field in the past or with the Regular Air Force in the future, and consider that such a force must be more efficient than one run purely on the lines of the Army Territorial Scheme, in which an officer need have only a month's preliminary training combined with a certain number of parades in addition to the ordinary fortnight's training in each year. AILERON.

THE AIR MINISTRY METEOROLOGICAL BRANCH.

The Air Ministry Meteorological Branch has removed to Canada House, Kingsway. The address for correspondence is, Secretary, Air Ministry (F.O.5), Canada House, Kingsway, London, W.C. The telegraphic address will be as heretofore, Flyindom, 'Phone, London. Requests for weather reports by telephone should be made to Holborn 2951, Extensions 520, 521, 522, 523, 524 or 525.

At Last !

For some time past the endeavours of designers and manufacturers in England have been concentrated on producing a *reliable* motor machine that combined lightness, simplicity of control, travel-comfort, and economy of running. A machine devised on these lines would have a universal appeal.



The advent on the market a few weeks ago of the

A.B.C. SKOOTAMOTA
TRADE MARK

aroused phenomenal interest, and the unanimous approval of press and public alike justifies our assertion that in the A.B.C. SKOOTAMOTA this "Ideal" is a reality at last. The design of the A.B.C. SKOOTAMOTA is due in great measure to the collaboration of Mr. Granville Bradshaw, the well-known Aero Engine expert.

An artistic little Booklet, No. 24, giving full particulars of this wonderful little machine can be obtained from the sole manufacturers and distributors:

GILBERT CAMPLING, LIMITED
(Members M.T.A.)

Machine d sign Reg'd. No. 668379.

OUR TEMPORARY INSANITY.

By Captain P. A. BARRON, (late) R.A.F.

Major-General Sir Hugh Trenchard, K.C.B., D.S.O., dropped a bomb among the bombers the other day when he outlined to a select company of Independent Force officers the future of the R.A.F.

He was most apologetic over the plan that he sketched, and informed his hearers at the outset that many would be disappointed. And they were.

Had anyone else made the announcement, one thinks that the feeling of disappointment would have found expression, but the fame of Sir Hugh Trenchard is so firmly founded in a Force the higher commands of which have not been overstocked with heroes to worship that criticism was for the moment withheld. Among so many there was the feeling that if Sir Hugh says the scheme is good it is good, and there is nothing more to be said . . . or, at any rate, it must be better than it sounds, as the old lady remarked when speaking about Wagner's music.

One is quite prepared to believe that the tune to which the R.A.F. is to dance is better than it sounds, but one's ears are not deaf to certain discords. One feels that Sir Hugh's apologetic attitude indicates that he is not the composer but the conductor, and that he has had some difficulty in getting the component members of the band to play in harmony. One feels that he realises the defects as keenly as anybody.

Briefly he told his hearers that a very small number of permanent commissions will be granted, and that the strength of the Force will be maintained by the granting of temporary commissions. The word "temporary" is to indicate a period of two or four years. This appears to be a scheme calculated to please those friends of every country but their own who before the war begrudged every penny of the money spent on undermanned Services which, owing to non-militant vote-cadging amateurs in statecraft, were a direct incentive to militarism among our enemies.

The plan appears to be an extension to officers of the short-service system which so many Army men think a colossal mistake. It can have been formulated only for reasons of economy. Apparently the argument is that in four years, or perhaps two, it is possible to produce a moderately efficient officer. After that period he may revert to civilian life on the understanding that he will be called when wanted. To paraphrase Mr. Rudyard Kipling:—

> "I've served my time in the Air Force,
> His Majesty says, 'Good-day,
> And please to come when you're called for,
> And here's gratuity pay.'"

As a tentative scheme this may have some features that are not altogether bad. Presumably the temporary commissions will be given to officers who have served in the war. These will therefore remain on the active list until civil aviation has developed sufficiently to offer positions for a certain proportion of them. For the individuals this has attractions, but, if the premises upon which the argument is based are sound, then these officers who have served in the war are not the ones who should be granted temporary commissions, because they are already trained. If the temporary commissions are to be granted merely for the purposes of training a reserve, then it would appear to be logical to give them to those who are at present untrained. The reasonable course would be to grant temporary commissions to a large number of the more promising cadets who had not completed their training up to the time of the armistice and to select a number of officers who have served in the war for the purpose of leavening the mass with whatever traditions have survived the mésalliance of the R.N.A.S. and the R.F.C.

It is when we consider the type of person who will be attracted by the temporary commissions that we begin to realise the weakest points of the scheme. A short-service system for men is not at all the same proposition as it is when it is applied to officers who, in peace-time, should surely be drawn in the main from the professional classes.

The man of the working class (in practice it is the out-of-work class) who enlists as a private for three years does not stand to lose much. In fact, his Army training may be of commercial value in after-life. But the young man of the professional class who accepts a commission for four years is giving the most useful period of his life when he would otherwise be laying the foundation of his career. After his four years' service he will find himself with somewhat extravagant tastes landed into a world in which his school contemporaries have already begun to make their way. Whatever his career may be, he will have to start at the bottom, and, having been trained to regard himself as an officer and a gentleman, he will find it much harder to begin again in a subordinate position in the profession he, or his parents, have chosen.

The war has taught us that the boy who came fresh from school to a commission with ample pay is not likely to make a satisfactory civilian—at any rate for some years. Yet he is to-day starting afresh in a world that fully understands and to some extent sympathises with his position. It will be very different under peace conditions, when he finds himself starting four years behind his contemporaries.

We still have in this country, despite the efforts of mob-elected legislators to tax them out of existence, a large class of families with service traditions. The great majority of them are not moneyed people in the modern sense, but the sons of these families are reared in the atmosphere of the Public Schools and the Services. These families supply officers to the Navy and Army generation after generation, and they are the best officers in the world. They have family tradition behind them, and the Services are their careers.

Will the sons of these families be attracted by temporary commissions in the R.A.F? The answer is most certainly not.

We turn, therefore, to another class—the moneyed family, in which the sons may serve in a smart cavalry regiment for a few years, not because they intend to make it a career, but because it is the thing to do and gives them a footing in Society. It seems extremely probable that this class will be attracted by the temporary commissions.

We arrive, therefore, at the propositions that the sons of families with Service traditions strongly ingrained will not be lured into a Force that does not offer them a career, that the sons of other professional classes cannot afford to spend four years in an organisation that leaves them at a loose end as soon as they have gained a certain value to the country, and that the only person who is likely to be greatly attracted is the person of independent means who can afford to join the R.A.F. for a few years before he settles down to a comfortable career of dissipating the family dollars.

Frankly, one does not like the outlook. One holds the opinion, open, of course, to revision, that a class of professional officers with tradition behind them and

Imber Anti-fire Tanks,
LIMITED.

Messrs. Brown and Meluish and Mr. Imber have formed the company to manufacture the Imber Anti-fire Tank, for the prevention of fires in aircraft accidents.

The Imber Anti-fire Tank is supplied to, and is the only self-sealing Tank approved by, His Majesty's Government.

The Company hold the sole and exclusive rights of the Imber Patent No. 122853. For particulars please write to 6, 7 & 8, Park Street Works, Islington, N.

Phone: North 1774. Wires: Bromelpar, Hibury, London.

The Imber Anti-fire Tank prevents fire in aircraft accidents.

entering the Force with the fixed idea that their service is the *raison d'être* of their existence will always prove superior to those others who regard it as merely offering them the opportunity of enjoying a few years of rather amusing experiences.

In opposition to these views are those held by non-militarists who say that we improvised out of ordinary civilians a Force good enough to beat the Huns, and could do it again. That argument is not quite sound. So far as air forces were concerned, all nations in the war practically started from scratch. If we had held undisputed mastery of the air on the first day of the war a vast number of lives and an incalculable amount of money would have been saved. Instead of starting from scratch next time one would prefer to start with a lead. We should like to see the enemy as reluctant to send up their aircraft as the Germans were to send out their Fleet.

The next point raised is that the active life of a flying officer is necessarily short—perhaps ten years—and therefore the R.A.F. cannot offer careers for a large number. In the first place one queries the proposition that, when freed from the strain of war conditions, the flying period is limited to ten years. One would be inclined to raise it by fifty per cent. Secondly, if practically all the ground jobs were filled by ex-flying officers, there would be plenty of appointments in the administrative and technical branches for the older officers.

What will be the relations between the regular R.A.F. officer and the temporary officer? One feels instinctively that there will be a gulf between them. Just at first this may not be very noticeable, for it is presumed that many of the temporaries will have seen active service. But later on, when these valuable officers have to retire in favour of the comparatively useless novices, one thinks that the line between the pukka and the temporary will be very strongly marked indeed. There will be the vast difference between the professional and the amateur.

One would prefer to see some of the money spent on the temporary commissioned branch devoted to the encouragement of a territorial reserve from which the permanently commissioned officers might to some extent be recruited. This would enable us with the balance to keep a larger standing force of permanent officers.

With regard to those who are demobilised, permission to retain rank ought to be conditional upon willingness to remain in the reserve with the obligation of a certain number of days' training each year. To allow the old R.N.A.S. and R.F.C. officers to lose touch with the Force appears to be a mistake

As one said at the outset, the scheme appears to be a tentative one drawn up at a time when the country is passing through a period of reconstruction. One sincerely hopes that it is not final, for one feels that it is not upon those lines that the ideal Air Force that will attract the best of the young men of Britain will be built up.

THE ROYAL AERO CLUB.

Rolls Memorial Library.

A meeting of the Library Committee was held on Monday, June 16th, 1919, when there were present:—Major C. C. Turner, Mr. Howard T. Wright, and Mr. Harold E. Perrin, Secretary.

Special Committee Meeting.

A Special Meeting of the Committee was held on Tuesday, June 17th, 1919, when there were present:—Brig.-Gen. Sir Capel Holden, K.C.B., F.R.S., in the Chair; Mr. Ernest C. Bucknall, Mr. G. B. Cockburn, Lieut.-Col. John D. Dunville, R.A.F., Lieut.-Col. T. O'B. Hubbard, M.C., R.A.F., Lieut.-Col. F. K. McClean, and Mr. Harold E. Ferrin, Secretary.

Election of Members.

The following new members were elected:—Lieut. Ian Patrick Anderson, R.A.F., Lieut. Cecil Wasbrough Andrewes (1/15th Highland Light Infantry), Lieut. Walter William Baker (Hampshire Regt.), Horace Rycroft Bass, Major Walter Henry Bell, R.A.F., Major Francis Herbert Bramwell, R.A.F., Edward John Bray, Bertram Christian, Albert Edward Cole, Capt. Edward O'Donovan Crean, R.A.F., Capt. Rupert John Goodman Crouch, R.A.F., Frazier Curtis, Capt. Robert Frederick Lea Dickey, R.A.F., Capt. Wilfrid Henry Dunn, R.A.F., Major Charles William Nutting, R.A.F., Lieut.-Col. Hubert Pennington, C.M.G., D.S.O., R.A.S.C., Capt. John William Pinder, D.F.C., R.A.F., Oswald Eric Tattersall, Capt. Albert Peter Thurston, Lieut. Harold Tomlinson, R.A.F., Capt. Cresswell Turner, R.A.F., Capt. Wilfrid Underhill, R.A.F., Capt. Robert Howell Craster Usher (Wiltshire Regt).

Trans-Atlantic Flight.

The following messages from the Officials of the Club in Newfoundland and Ireland were reported:—

"St. John's, Newfoundland.

"Royal Aero Club, London.

"Capt. Alcock and Lieut. Brown left St. John's, Newfoundland, in a Vickers "Vimy" Rolls on flight to England today, June 14th, 1919, at 4.13 p.m., G.M.T.

"Capt. Clements."

"Dublin.

"Royal Aero Club, London.

"Official time of arrival of Vickers "Vimy" Rolls crossing coast line Ireland was 9.25 a.m., B.S.T. (8.25 a.m. G.M.T.), June 15th, 1919. I examined machine and found everything in order.

"Major R. H. Mayo."

Balloon Ascents.

In view of the coming revival of the sport of ballooning, those wishing to participate, including owners of balloons, are requested to communicate with the Royal Aero Club, 3, Clifford Street, W.1.

The Flying Services Fund.

(Registered under the War Charities Act, 1916.)

Administered by the Royal Aero Club for the benefit of Officers, Non-Commissioned Officers and Men of the Royal Air Force who are incapacitated while on duty, and for the widows and dependants of those who are killed or die from injuries or illness contracted while on duty.

Honorary Treasurer.

The Right Hon. Lord Kinnaird.

Committee:

H.R.H. Prince Albert, K.G. (Chairman).
Mr. Chester Fox.

Jacques Schneider Maritime Cup.

The Jacques Schneider Maritime Cup having been won in 1914 by C. H. Pixton on a Sopwith seaplane, the nominee of the Royal Aero Club representing the British Empire, the Race for 1919 will be held in England early in September next. The exact date and place will be announced later.

The Race will be over a distance of 200 nautical miles exclusively at sea, in a closed circuit having a minimum course of five nautical miles, and situated outside any port or enclosed harbour. At least two alightings must be made on the water at points fixed by the officials.

The Committee of the Royal Aero Club will select the three competitors to represent the British Empire, and reserves to itself the right to hold eliminating trials.

Entries are to be made at the Royal Aero Club, 3, Clifford Street, London, W.1, not later than July 31st, 1919. Each entry must be accompanied by the entry fee of £20.

RELINQUISHMENT OF LEYSDOWN AERODROME.

The Air Ministry announces that Leysdown Aerodrome will shortly be vacated by the R.A.F.

"SHELL" PERFORMS THE "HAT TRICK!"

The WORLD of AERONAUTICS

NEWS OF THE WEEK FROM ALL QUARTERS

Dirigible Balloonacy.

In the "Aircraft Journal" of America, an article was published recently dealing with the uses of airships in times of peace. The following suggestions are made:—

"The dirigible will be useful to the Bureau of Mines because it can carry prospectors at low altitudes as they search for symptoms of minerals.

"In tropical forests trees of great value can be hunted for by their flowers, leaves or other symptoms seen from above.

"In countries where migratory insects like locusts need surveillance, scientific measures can be taken to find their breeding places and sterilise the egg-laden areas. A dirigible can follow a locust cloud and by the use of gases and explosives disperse it or drive it away from valuable crops.

"The Revenue Guards and the Department of Justice can use the dirigible to detect smugglers and to pursue large bands of outlaws, especially if they are mounted or have stolen live stock or property in vehicles."

One does not know which suggestion to admire most. The bombing or gassing of locusts appear to be the most practical, and would seem to provide better sport than the hunting of trees by their symptoms.

The pursuit of large bands of outlaws seems to offer great possibilities. Large bands would, of course, be chosen, because the smaller bodies of bandits would not have sufficient strength to pull down the dirigible in order that they might be arrested.

More Crimes Needed.

The "Daily Mirror" on June 28th published a photograph of a machine flying through the Tower Bridge. Underneath the picture appeared the following:—

"Don't Do as I Do."—The Air Ministry has forbidden flying through the Tower Bridge. This picture shows General Seely, Under Secretary of State for the Air, recently doing the feat which is now forbidden."

The "Daily Mirror" does not appear to understand that the time has arrived when it is essential to invent some crimes in order to prove the necessity for aerial police. Shortly, we may see a special Experimental Crime Department to devise stunts that are dangerous to the public in order that they may be prohibited. The Department might, for example, try the sports of taxi-ing a Vickers "Vimy" down Rotten Row, sea-planing in the Round Pond of Kensington, or dropping war souvenirs, such as unexploded bombs, to incite people to invest in the Victory Loan. As the deadliness of each experiment is proved the necessary legislative action can be taken. One would like to suggest that prizes for original sin should be offered.

Before the Dry Law.

In the United States officers recruiting for the Air Service bring in their victims by aeroplane. A recent official report contained an account of a recruiting flight during which the engine gave trouble and the prospective recruit arrived thoroughly oiled but happy.

The new "dry" law will check this sort of thing.

A Novel Design.

An aeroplane of an entirely new design appears to have been invented in America. The following is a description which has been published:—

"Recent requests for bids for airplanes by the Air Mail Service resulted in eight bids, of which the lowest are from the Lawson Air Line Co., Milwaukee, which has designed a plane embodying mail car equipment, and allows for the employment of a mail clerk en route. The engines will be installed by the Government and it is expected that the Liberty engine will be used.

"The airplane is of the biplane type, with the chassis built between the two wings with engine space provided at each side. There is sufficient space so that the men can walk round the body, which is enclosed in glass. A rack has been designed in which the mail may be distributed during the flight, and a drop chute allows for the discharge of mail bags at principal cities without stops. A model of the plane has been ordered and will be demonstrated here (at Washington) when completed."

The chief novelty is the undercarriage between the two planes. Presumably, the designers consider that a chassis in that position is not so liable to suffer damage in the event of a bad landing. One is glad to note that engine space is provided on each side of the undercarriage which is so ingeniously protected, as otherwise the engines might have been crowded out of the machine. Also, it seems an admirable idea to provide a promenade round the glass-enclosed body, as had this been omitted, the crew might have tried to break their way in and disturb the sorter.

To Watch the Weather.

The "Daily Chronicle" says "the Air Board is to be congratulated on taking over the disused observatory on the summit of Ben Nevis, which lack of funds compelled the Scottish Meteorological Society to close in 1904. The highest peak in Great Britain, the top of Ben Nevis, is an ideal situation for the obtaining of data concerning the phenomena of the atmosphere, about which we know so little."

The "Air Board" certainly is to be congratulated upon this evidence of continued vitality. One had heard rumours that an Air Ministry had been founded.

At any rate, now we know why the classic aerodrome at Montrose has been closed.

Plans.

The club is always an interesting place to visit at the week-end. It is a recently formed Service club, and at present the newly demobilised gather in large numbers to discuss their hazy plans for the future.

Several companies with capitals ranging from £5 to £50,000 are formed every two minutes, and are as quickly wound up, and many are formed with no capital at all, with the main object of sitting still and watching the money come in. The atmosphere is tense with excitement, and agitated groups discuss the merits of every new scheme, one ingenious member flourishing a note-book into which he has copied all the new ideas that come to him each morning while he is shaving.

To go from group to group is to learn how easy it is to pick up thousands of pounds and amongst many of these get-rich-quick schemes, some of the following may be of use to those not blessed with a fertile imagination.

A company for the exploration of Central Africa, with the object of giving nigger kings joy-rides in aeroplanes and demanding ivory tusks in payment.

A company for supplying collar-stud machines, to be placed in conspicuous public places, and intended for the use of the red and angry owners of floating collars.

A company for making any old drink that will prove sufficiently intoxicating.

A company for supplying Nova Zemblians with Gold Flake and rum in exchange for white fox furs.

A company for receiving old gold braid from Service hats and re-upholstering it for the use of cinema attendants

A company for buying scrap metal and selling it as motor cars and many other sound propositions that could be handled with the necessary confidence.

Five thousand companies formed for the purpose of teaching girls to fly. All wound up, as being too dangerous. Besides which, it was considered to be unbusinesslike to risk having a balance-sheet made up of liabilities and no assets.

A company formed for the purpose of preserving the dignity of majors reduced in rank.

This company, for a small consideration, would salute and say "Sir" all day long, if necessary.

It came to nothing, as the greater number of members of the R.A.F. having been majors at some time or another, it was held that there would not be a sufficiency of junior members to do the work of the company.

Unfortunately, as everyone talks at once, none of the promotors get a fair hearing, otherwise there would have been several fortunes made and lost already. R. A.

Bad Taste.

The "Aerial Age" of America recently published the following:

"The first sermon from the air, preached by a 'sky pilot' of the Methodist Church, will be a headliner at the Methodist Centenary Exposition, to be held at Columbus, Ohio, June 20th to July 14th, according to plans announced.

"According to the exposition's Press agent the aerial sermon will be preached by a minister who will float above the heads of his congregation at a height of 2,000 feet or so. His message will be audible to all by means of a wireless telephone and a megaphone attachment."

It is difficult to conceive anything more nauseating than this method of advertising. One would think that the vulgarity of this "sky pilot's" methods of gaining "headliner" publicity would shock the religious susceptibilities of a partially fossilised Aztec.

The WORLD of AERONAUTICS (continued)

Autre Pays—Autres Moeurs.

It is understood that the French Authorities have given permission to the Nieuport firm to enter their latest type of high-speed single-seat fighter for open competitions in either France or any Allied country, and that they only failed to enter for the Aerial Derby because sufficient notice was not given to enable the necessary arrangements to be made.

It is further understood that the French Government is willing to supply responsible French firms who wish to initiate aerial transport schemes with service aircraft and engines and to pay these firms a subsidy for maintaining such service machines and engines in efficient running order.

Although our national vanity might have been piqued if a French machine had won the Aerial Derby, one feels that it would have been a useful lesson to the Air Ministry and would have shown the country the folly of prohibiting the use of the fastest British machines in the race.

With regard to the supply of machines and the subsidies for the encouragement of commercial aerial transport schemes, this policy is dictated by such sound common sense that one may feel assured that such a proposition would be enthusiastically condemned by our own Bolo.

No. 218 Squadron's Dinner.

A dinner will be held by 218 Squadron Officers. Will those desiring to attend please write to Major Wemp, c/o THE AEROPLANE, 166, Piccadilly, W.1, immediately?

No. 4 Squadron's Dinner.

A reunion dinner of No. 4 Squadron, R.A.F., will be held at the Criterion on July 22nd, Major-Gen. C. A. H. Longcroft, C.M.G., D.S.O., A.F.C., will be present as guest of honour. Any officer, past or present, wishing to attend should communicate with Mr. F. W. Rennie or Mr. Douglas Welch, R.A.F. Club, Bruton Street, enclosing £2 2s. cheque.

The Decline and Fall of Reticence.

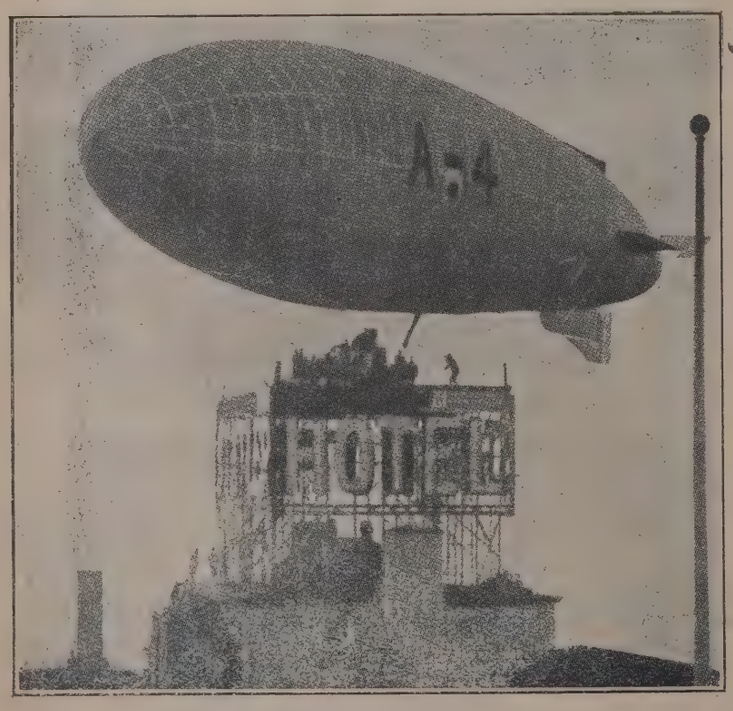
Sir,—This recent war now just concluded in a patchwork Peace has brought many evils to a weary world, not the least of which in the decline in those honourable principles which governed throughout many generations of English history the actions and the conversation of those who held His Majesty's commission.

In most of the newsprints of the day one may see the elaborate advertisements of a system of mnemonics which has attained some fame among the forgetful. One is tempted to wish that all might undergo such a course of training in this system as would make it possible to remember its virtues without the constant reiteration of illimitable advertisement.

One of these advertisements is in the form of a letter from an officer (whose name and portrait are given) who prefaces his eulogy of the system with a description of his rapid progress through life from the day when his parents presented him to an expectant world. In flowing periods he tells of his entry into His Majesty's Navy, and of his early experiences in Naval aeronautics. At the age of 27 he reached the pinnacle of his earthly progress when he was gazetted Lieut.-Colonel in the Royal Air Force. A year later he attained his first serious failure and became a Member of Parliament.

Sir, his recent career would appear to be but a feeble testimonial to the new system for which he claims so much. He admits that it is scarcely two years since he first fell under its allurements while resting in one of His Majesty's ships of war, yet in that time his decline has been swift. Then he was an officer of promise (we are assured), to-day he is a Member of Parliament! It is hard to see what worse ill could befall him. His progress should be an example to others lest they, too, drift towards the rapids of Westminster borne there by sheer force of memory.

Yet it is not the career of this candid Member of Parliament which is of interest to those who have pride in the manners and habits of officers in the Military Forces of the Crown. Reticence and a strong dislike of self-advertisement have always dominated the actions of those who have the honour of their great profession at heart. Have these principles been allowed to lapse because the soil of France and Flanders covers the mortal remains of so many of those who worthily upheld them? And are we to expect in the future glaring advertisements of soaps, patent medicines or tailors written by soldiers and sailors of notoriety?



Will such headlines as "How the Use of Bermondsey Beer Brought Me Promotion to Brigadier-General," or "From Midshipman to Mansion House; or How Howell's Hair Oil Helped Me to Municipal Success," fill the advertisement pages of our prints in future? The old order is indeed dying; but surely it is not too much to hope that even in this modern England public opinion will be against soldiers and sailors adopting the methods of musical comedy actresses or of mythical old ladies of obscure origin whose "bad legs" have been cured by continuous applications of somebody's "Elixir of Vitality," price 1s. 6d. post free.

MILES.

The Sky Entrance

A 160 ft. airship, carrying five passengers, recently flew from Akron to Cleveland, Ohio, against a stiff wind in about an hour, and although both wind and rain interfered, a landing was effected on a platform of 30 by 50 ft., built on a hotel roof. The airship was steered slowly over the hotel and ropes were thrown down to the platform on to which the carriage of the balloon was drawn.

An airship, to carry 12 passengers, is being constructed to make flights during this summer to the hotel roof from Akron.

An American Airship alighting upon the roof of an Hotel at Cleveland, Ohio.

Ten Thousand Pound Flights.

It has been announced that Capt. Sir John Alcock, D.S.C., and Lieut. Sir A. Whitten Brown, winners of the "Daily Mail" £10,000 which they invested in Joy Loan, will give free flights over London in a Vickers "Vimy" Rolls-Royce machine to subscribers of £10,000, and will present each passenger with an autographed photograph of their Atlantic machine

The American Method.

The Curtiss Aeroplane and Motor Corporation has repurchased from the American Government 2,176 aeroplanes and 4,608 motors which they made during the war.

Included in the deal are 1,100 aeroplanes which the Curtiss Corporation did not build, but which they are buying in order to get back the Curtiss engines with which they are fitted.

All machines needing overhauling will be sent to the plant in Buffalo, and a staff of mechanics will be maintained to inspect every one before delivery to customers.

The American Government seem to have found a far better way of disposing of its surplus aircraft than the method adopted over here of scrapping the machines as soon as they were delivered by the makers.

The Sahara Flight.

Lieut. Lemaitre, the French aviator, attempted to fly from Paris across the Sahara. The first stages were to Casablanca, Marakesh and Mogador. He left Mogador on June 28th, and flew over Agadir on his 2,200-mile flight across the Sahara to Dakar.

A telegram reached Paris on June 30th intimating that he had crashed at Porte Etienne in Mauritania, about 400 miles from Dakar. He and his passenger are safe.

The WORLD of AERONAUTICS (continued)

The Trans-Atlantic Flight.

THE AIRSHIP ATTEMPT.

The British Naval Airship R.34 is expected to make an attempt upon the Atlantic flight on July 2nd. Her officers are :—

Captain.—Major G. H. Scott, A.F.C. First Officer.—Lieut. G. S. Greenland. Second Officer.—Lieut. H. S. Lock. Engineer Officer.—Lieut. Shotter. Navigating Officer.—Major G. G. H. Cooke, D.S.C. Meteorological Officer.—Lieut. G. Harris. Steersmen.—Major J. E. M. Pritchard, O.B.E.; Lieut.-Comdr. Lansdowne, U.S.N. Wireless Officer.—Lieut. R. F. Durrant. Air Ministry Representative.—Brig.-General E. M. Maitland, C.M.G., D.S.O., Superintendent of Airship Equipment.

THE AEROPLANE ATTEMPT.

The Handley Page aeroplane has been ready for the start since June 20th, and Vice-Admiral Mark Kerr hopes to make the flight in 18 hours.

Mr. Raynham's Martinsyde is now rebuilt, and has been renamed the "Chimera." It is ready for the trial flight, which has by this time probably taken place.

A £5,000 PRIZE.

American newspapers announce that a prize of $25,000 has been offered by Mr. Raymond Orteig for the first non-stop aeroplane flight between New York and Paris, a distance of about 3,600 miles. Competitors must be of Allied nationality. The Aero Club of America is preparing a set of rules concerning the conditions under which the flight must be made. Competitors may start from either side.

Coming Events.

JULY.

The Royal Naval, Military, and Air Force Tournament at Olympia open until July 12th.

Saturday, July 5th.—Hendon Peace Meeting.

Sunday, July 6th.—Special Flying Displays at Hendon

Saturday, July 12th.—R.N. Air Station Eastbourne Dinner.

Saturday, July 12th.—Summer meeting at Hendon.

Sunday, July 13th.—Special Flying Displays at Hendon.

Saturday, July 19th.—Martinsyde Recreation Club Sports at Woodbridge Road, Guildford.

Friday, July 25th.—The Amsterdam Aircraft Exhibition opens.

AUGUST.

Tuesday, August 5th.—Handley Page Social and Athletic Club's Sports. Starting at 12 midday at Cricklewood Lane.

Thursday, August 21st.—R.A.F. Annual Athletic Meeting at Stamford Bridge.

Sunday, August 24th to Sunday, August 31st.—The "Avenir's" Tour de France Aérien.

DATES TO BE ANNOUNCED LATER.

Hendon—Birmingham—Manchester Air Race.
Hendon—Paris—Hendon Air Race.
Hendon—Brighton—Hendon Air Race.

PARIS NOTES

AERODROME FIRES.

The Paris aeronautical industry has sustained two very big losses by fire in the last two weeks. Firstly, there was the fire at Voisin's works at Issy-les-Moulineaux, although happily it is believed the loss does not exceed £16,000. Work is continuing in that part of the works left untouched, and the new four-engined Voisin will undergo further trials as soon as the few modifications have been completed.

Secondly, there was a conflagration at the Saint-Cyr aerodrome on the 21st inst. The fire broke out about two in the afternoon in a repair shop, and, aided by a violent wind, spread rapidly to the neighbouring hangars, and was not subdued till six in the evening. Eighteen hangars, 102 machines, and a huge stock of fabric, airscrews, motors, and spare parts, were reduced to cinders. Most of the complete machines, such as Breguets, Spads, and Moranes, were removed in time. It is estimated that damage to the extent of £160,000 was caused, although, contrary to the canards which quickly circulated, it represents but a twentieth of the total value of material in this one centre of aviation. The military authorities are instituting an inquiry into the cause. Some authorities, who know the aerodrome and its occupants well, are asking whether it may not have been caused by the Annamites working on the aerodrome who were imprudent enough to light fires in proximity to the Bessoneaux.

AN AERIAL TOURNAMENT.

Last Sunday, the 22nd inst., on the east side of Paris was opened the Stade Pershing, built by American soldiers and presented to the French nation. As is usual with such opening ceremonies, a great gala programme was arranged, among which, to cut a long story short, was an exhibition with different types of avions belonging to the French, Italian, Belgian, and American armies. The following took part :—French : Two Spads, two Farmans. Italy : two S.V.A., three Capronis (one triplane). Belgium : one D.H.Q., two Breguet, one Hanriot, one Spad. America : One Salmson, one D.H., one Avro, and one Spad.

To end up the day really nicely and to show the civilians how the war was really won, a battle was to take place between two Spads and a Fokker, the Fokker being mounted by an American, Capt. Moseley. Naturally the Spads were to triumph over the Fokker, although why it was necessary to have two Spads to attain this end the authorities do not vouchsafe. However, revenons à nos moutons, a lively combat ensued, and the Boche machine was (cimematographically, at all events) beaten, and should have landed on the parade ground at Vincennes. It did, but not in the way intended, and the pilot was seriously injured. The machine was reduced to bois cassé.

PARIS-CASABLANCA ON THE WAY TO DAKAR.

Readers may have noticed that I often refer to Dakar in these notes. I wonder if they know where it is? Take a map of N.W. Africa and follow the coast round from Tangiers and Dakar will be found situated on that part of the West African coast nearest to South America, hence the interest of the French in their own sort of Atlantic enterprises. Lieut. Lemaitre, who at the time of writing last week's notes had only got as far as Cazaux, left there at eight in the morning last Wednesday, and arrived at Casablanca at five p.m. Actually there is no further news of his continuance of the trip, although rumours abound. What is very sad to relate, however, is that, although his route from Casablanca to Dakar will take him over desert and savage country inhabited only by hostile or inhospitable tribes, and that, therefore, he must avoid landing by every precaution and means in his power, the French authorities, whilst permitting him to make the flight, refused him the help of any torpedo boats which are always in the vicinity, in case he should descend to the sea, whilst following the coast.

Lieut. Lemaitre is very discouraged at this refusal on the part of the authorities, and, whilst he is going to see the attempt through to its successful or unsuccessful conclusion, he has announced that it is the last of its sort that he will undertake. The unfortunate decision of the military and naval authorities is commented on very unfavourably here, and is the subject of considerable protest. Lieut. Lemaitre was the first to initiate an aerial postal service between France and Morocco.

FRENCH INFLUENCE IN THE BALKANS.

The Budget Commission has just voted the necessary credits for establishing several aerial lines in the Balkans. These lines will have Constantinople as a base, and will serve principally Asia Minor and Syria. Mesopotamia is to be left to the British influence, but the French will run one line with a terminating point at Cairo. According to present arrangements, the following is a list of the new airways proposed :—Constantinople-Smyrna-Grecian Archipelago ; Constantinople-Palestine, Mecca-Egypt ; Constantinople-Armenia, Caucasia-Persia ; Constantinople-Bucarest-South Russia ; Constantinople-Salonika-The Balkans.

£20,000 FOR ALGERIAN AVIATION.

From Algiers comes news that local financial delegations voted on June 13th a sum of £20,000 for the establishment of transportation by the way of the air.

BRITISH RECORD FLIGHTS—INFORMATION WANTED.

The Sporting Commission of the F.A.I., under the presidency of Mr. Soreau, have fixed August 31st as the last date on which dossiers relating to possible height, duration, speed or other records made during the war can be accepted.

Any pilots who have put up performances that they seriously believe to be world's records in any particular class are asked to get the necessary documents and proofs in dossier form and to send the whole to the Commission Sportive Aeronautique, 35, Rue François Première, Paris, before August 31st.

SAUSAGES FOR SALE.

The American Aviation Camp at Romorantin (Loir-et-Cher) notify for sale 100 kite or observation balloons having a capacity of 991,000 litres, eight smaller balloons and several baskets, nacelles and attendant tackle. The French Press point out what an anomaly it is that the Americans are allowed to sell comparatively useless stuff, and yet are not only not allowed to sell their cars, but are permitted or ordered to burn them.

A TIMELY GIFT.

The Military and Naval Aeronautical Convalescent Home at Viry Chatillon (S.O.) is about to close its doors. At the end of its useful career it finds itself with a surplus of £2,000, which it proposes to hand over to the joint Aeronautical Aid Society of the French Aero Club and the French Aerial League.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

In the article on the Development of Aircraft Engines, Capt. Sayers suggests with considerable emphasis that it would be well worth while for aero-engine builders to design power-plant units, including engine, radiator, service petrol and oil tanks, and their connections, complete in a frame so that the whole might be bolted onto a fuselage end plate.

Capt. Sayers also argues strongly in favour of the substitution of a generator, battery and coil ignition system to replace the magneto.

Under the heading of "Modern British Aeroplanes" two machines built by the British Aerial Transport Co. which have as yet made no public appearance are described.

The report of the Wilbur Wright Memorial Lecture, read by Mr. Leonard Bairstowe, is concluded.

A letter from Mr. J. D. North on page 62 criticises Mr. C. W. Tinson's article on Longitudinal Stability recently published, and points out an important factor which has been neglected therein.

An illustrated description of certain American designs of super-charger, intended to maintain the output of aero-engines at high altitudes, is given in this issue.

The American work is entirely of the nature of a development of the Rateau exhaust gas turbo-compressor system, which has been boomed in the Press as an "Aerial Turbine."

THE DEVELOPMENT OF THE AERO-ENGINE, PAST AND FUTURE.—IV.

By Capt. W. H. SAYERS, late R.A.F.

Thus, although the Diesel type of aero-engine offers many possibilities for the future, the immediate development of commercial aviation must proceed with the aid of engines more or less similar to those of the present day.

The number of cases in which it would be possible to carry the extra weight of a Diesel-type engine at present is strictly limited.

The immediate problem, therefore, is to turn the petrol engine of to-day into a reliable and reasonably cheap power plant.

It has already been said that 75 per cent. of the failures of to-day are accessory failures, and that the engine proper can be made almost absolutely reliable by a process of "easing up."

Any really competent engine designer should be able to produce an engine which would itself never fail—if he were allowed to add ¼ lb. per horse-power to the weight of his present engine, and this part of the problem presents no difficulties.

With the accessories the question is different.

The Habits of Engine Builders.

Engine-makers themselves are very largely to blame for having in the past failed to look after the installation of their engines.

A few encounters with the representatives of firms who are responsible for the design of some of the best-known types of aero-engines give the impression that they neither know nor care what happens to their products when once they have left the test bench.

Apparently, if they care at all, the care is confined to their advertising department, and, if they know, their knowledge is admirably concealed.

A proper study of the conditions under which their engines have to be used, and a properly organised installation department, at the service of any aeroplane manufacturer who wished to instal one of the firm's engines, would prove a much better investment in the long run than the building of a few special engines for much-advertised competitions.

The Design of Power-Plant Units.

It is by no means impossible to treat an aeroplane power plant as a single unit, and to design an engine, radiator, oil tanks, and service fuel tank complete in a frame which can be bolted to a suitable front plate on any fuselage or nacelle, leaving the aeroplane builder nothing to do but to bolt on his power unit and make a few control connections and possibly fit one fuel supply pipe to the service tank.

It might possibly be necessary to arrange for two different-sized radiators—one for high-speed machines and a larger one for slower types—and to issue the power units in two types for each engine—one for pusher and the other for tractor airscrews.

Any engine manufacturer who cares to go to the trouble of attacking this problem and producing a complete and satisfactory power unit on these lines may be certain of a warm welcome from every aeroplane designer.

Not only that, but he will know that his engines will be run under fair conditions and will not be credited with breakdowns really due to quite external causes.

Failure due to faulty installation could be practically abolished by such means at the expenditure of only a fraction of the time and trouble which is occasioned by the haphazard methods now employed, and a very considerable advance would thus be made towards reliability.

Ignition Troubles.

Next in importance to faulty installation, the ignition system probably accounts for more trouble with present-day aero-engines than any other accessory. The modern

magneto has a reputation for extraordinary reliability, and deserves it.

Nevertheless, the magneto is electrically and mechanically a *tour de force*. It is a combination of an electrical generator and an induction coil compressed into the smallest possible space and made to work under the most unfavourable conditions possible.

The maximum pressure generated in the high tension winding of a magneto armature is in the neighbourhood of 10,000 volts, and it is possible that this figure is greatly exceeded on occasion.

The Magneto's Handicap.

Insulating materials, particularly those which are suitable for such pressures as those mentioned, are practically all of low mechanical strength, and are liable to seriously deteriorate at high temperatures and in contact with oil.

The conditions which obtain in a magneto armature—lack of space and liability to mechanical stress from vibration, generally in the presence of a high temperature and with a liability to accidental soaking in oil—are by no means desirable ones.

In spite of this, in practice magnetos rarely break down—in the sense of failing to generate their normal output at the correct instant—but in modern high-duty aero-engines they frequently fail to produce the required spark at the necessary place—*i.e.*, across the sparking-plug terminals.

This failure is usually due to a derangement of the sparking-plug itself—sometimes to a fault developed in the high-tension wiring from the distributor to the plug.

The latter is, properly speaking, an installation fault.

Failure to produce a spark at the plug points because the plug is oiled up, or because of a small deposit of carbon across the insulating surfaces, may be avoided in time by plug designers.

It could be avoided at once if a source of ignition current is employed with a reasonable surplus of output over that actually needed for ignition.

It would be very difficult indeed greatly to increase magneto output, and particularly to increase the maximum pressure developed at the instant of breaking the primary circuit, simply because of the unsatisfactory conditions under which the magneto has to work.

The Coil and Battery System.

The coil and battery ignition of ancient days suffered from crude design and insufficient output, but inherently it has great advantages over the magneto.

Properly designed and made and with the addition of an engine-driven generator, coil ignition is likely to supplant the magneto entirely for all high-duty engines such as are used for aircraft work.

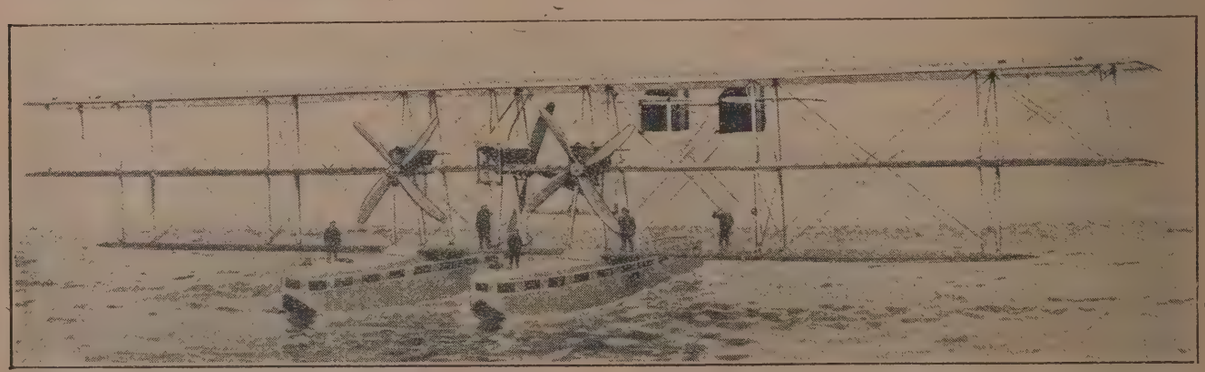
A purely low-tension, direct-current generator will give a much greater energy output for the same overall dimensions and weight than will a magneto. The insulation required on its windings can be relied upon to withstand the effects of heat and oil with much greater certainty than can that of a magneto.

An induction coil, made with the care now given to the building of a magneto armature, instead of on the lines of amateur-built spark coils which used to be employed for ignition purposes, enclosed in a weather-proof case and put well away from the engine heat and oil, can be made to give a very much heavier discharge, when fed by such a generator, than is given by any existing magneto.

The production of such an ignition plant is all in the regular way of business of existing magneto manufacturers, who would enhance considerably their own reputations and that of British Aircraft by turning their attention to this subject and producing a satisfactory ignition system.

The Value of Surplus Spark Energy.

Given these possibilities of a much greater spark energy spark-plugs with longer gaps and with greater room for insulation can be used, giving greater security against actual plug failure.



Over and above this, a very large surplus of spark energy would secure the certainty of ignition, even with an oiled-up or sooted plug, in fact under almost any conditions except those of metallic short circuiting of the plug points.

There is no difficulty in providing such surplus ignition energy with a coil, generator, and battery system. There are rather serious difficulties in the case of the magneto.

There are signs that some of the advantages of this type of ignition have been recognised, and that the old myth of the inferior quality of ignition which was obtained from coil and battery outfits was due to some intrinsic quality in the type of spark produced, instead of to the ill-design and inefficiency of the appliances themselves, is dying out.

The American "Delco" system of ignition, successfully used on the Liberty motor, is evidence of this fact, and the performance of the trans-Atlantic N.C. boats equipped with this ignition gear is testimony to the possible reliability of the system, for one learns that there was not a single fire in any of the engines employed in any of the three N.C. boats.

But the full advantages which can be secured by adopting this method of generating high-tension ignition current will only be realised when sparking-plugs of less cramped type than those now customary are used to complete the ignition scheme.

A Projected Passenger-carrier for long-distance overseas work, designed by Short Bros., of Rochester. Accommodation for 50 passengers with dining and sleeping facilities to be provided in the floats. The tail is to be carried on booms, "Bat-Boat" fashion. Span 160 ft., overall length 100 ft. Engines, 3 Rolls-Royce "Condor," each of 600 h.p. Estimated speed 100 m.p.h. The outer sections of the wings are arranged to detach in case of an emergency landing on the sea.

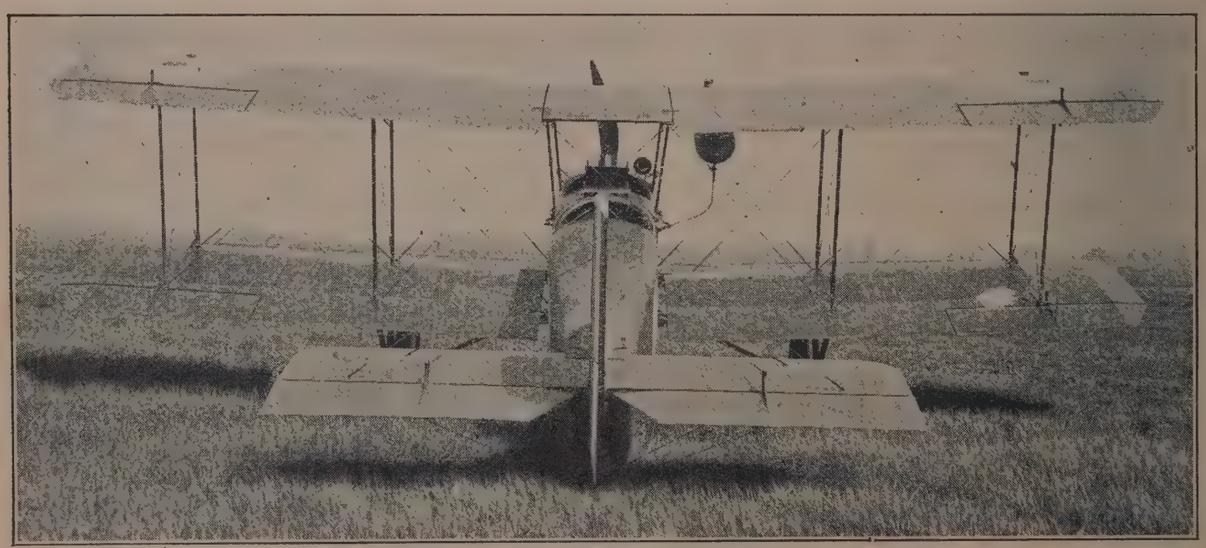
Three-quarter Front View of the B.A.T. "Baboon" Training Machine (170 h.p. A.B.C. "Wasp" Engine).

THE B.A.T. "BABOON" F.K.24.

A small dual control two-seater, designed for training purposes.



Very great attention has been paid in design to ease of manufacture and interchangeability of parts, so as to make it as easy and as cheap as possible to repair damage done by careless pupils and school mechanics.

As an instance of this it may be noted that ailerons, rudder and elevators are all identical and interchangeable.

The following are the leading particulars:—

SPECIFICATION.

Type of machine	Two-seater biplane (Dual Control)
Name or type No. of machine	B.A.T. F.K.24 "Baboon"
Purpose for which intended	Training
Span	25 ft.
Gap	4 ft. 8½ in.
Dihedral	2 deg.
Overall length	22 ft. 8 in.
Maximum height	8 ft. 10 in.
Chord	5 ft. 7 in.
Total surface of wings	259 sq. ft
Span of tail	9 ft. 10 in.
Total area of tail	27.75 sq. ft.
Area of elevators	12 sq. ft.
Area of rudder	6 sq. ft.
Area of fin	5½ sq. ft.
Area of each aileron and total area	6 sq. ft. each—24 total
Maximum cross-section of body	7.5 sq. ft.
Vertical area of body	52 sq. ft.
Engine type and h.p.	170-h.p. A.B.C. "Wasp"
Airscrew	B.A.T. 2-blade, 7 ft. 10 in. dia., 5 ft. pitch
Weight of machine empty	950 lbs.
Load per sq. ft.	5.2 lbs.
Weight per h.p.	7.95 lbs.
Tank capacity	2 hours
Tank capacity	12 galls.
Disposable load apart from fuel	400 lbs.
Total weight of machine loaded	1350 lbs.
PERFORMANCE—	
Speed down	90 m.p.h.
Speed, landing	40 m.p.h.
Climb—	
To 10,000 ft.	12 mins.

Some Details of the B.A.T. "Baboon" Training Machine.

THE B.A.T. F.K.27.

A really high performance two-seater sporting type machine, which follows generally the outline of the "Bantam" and "Basilisk" in design.

The two seats are arranged in a "staggered" or échelon position in the fuselage just below the trailing edge of the upper wing.

The lower wing is of considerably smaller chord and slightly less span than the upper.

The leading particulars are as given below:—

SPECIFICATION.

Type of machine	Two-seater biplane
Name or type No. of machine	B.A.T. F.K.27
Purpose for which intended	Sporting type
Span	26 ft. top, 22 ft. 10 in. bottom
Gap	3 ft. 11 in.
Overall length	20 ft. 7 in.
Maximum height	7 ft. 10 in.
Chord	Top 5 ft. 7 in., bottom 3 ft.
Stagger	8½ in. on leading edge
Dihedral	3 deg.
Total surface of wings	200 sq. ft.
Span of tail	9 ft. 2 in.
Total area of tail	23.4 sq. ft.
Area of elevators	6.3 sq. ft.
Area of rudder	4.4 sq. ft.
Area of fin	2.8 sq. ft.
Area of each aileron and total area	7.5 sq. ft. each—15 sq. ft. total
Maximum cross-section of body	10.5 sq. ft.
Vertical area of body	40 sq. ft.
Engine type and h.p.	200-h.p. A.B.C. "Wasp"
Airscrew	B.A.T. 2-blade, 7 ft. 10 in. dia., 5 ft. 4 in. pitch, 1850 r.p.m.
Weight of machine empty	800 lbs.
Load per sq. ft.	7 lbs.
Weight per h.p.	7 lbs.
Tank capacity	4 hours at ¾ throttle
Tank capacity	30 galls.
Disposable load apart from fuel	400 lbs.
Total weight of machine loaded	1,400 lbs.
PERFORMANCE—	
Speed low down	142 m.p.h.
Speed at 10,000 ft.	130 m.p.h.
Landing speed	50 m.p.h.
Climb—	
To 5,000 ft.	2 mins.
Ceiling	24,000 ft.

AERO ENGINE TESTS APPLIED TO CAR ENGINES.

It has heretofore not been considered necessary to test motor-car engines on the bench for long periods of continuous running at full power—because car engines are not generally required to run at full power for long periods in actual service.

The Sunbeam Motor Car Co., of Wolverhampton, have, however, demonstrated the fact that their new 16 h.p. (rated) four-cylinder car engines are capable of standing up to tests similar to those imposed on aero engines, by running two of them on the bench for 25 hours non-stop at 100 per cent. over their rated capacity.

Side View of the B.A.T. "Basilisk" (320-h.p. A.B.C. "Dragon fly" Engine).

AMERICAN SUPERCHARGING DEVELOPMENTS.

A Possible Means of Acquiring Additional Efficiency in Engines used on Commercial Aircraft.

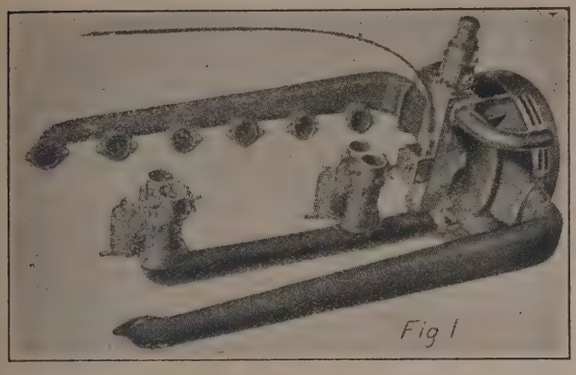

Fig. 1.—The Sherbondy Supercharger Unit for the Liberty Engine.

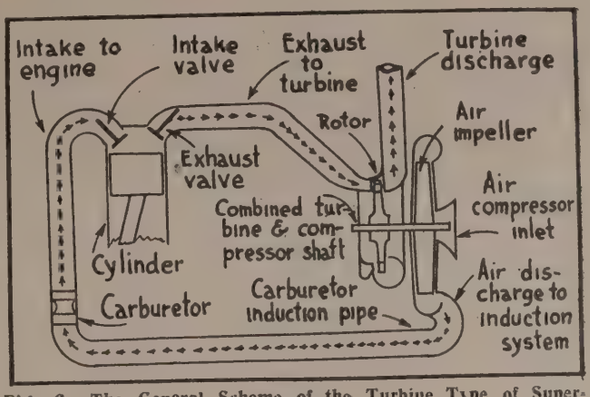

Fig. 2.—The General Scheme of the Turbine Type of Supercharger.

It is now a matter of common knowledge that a considerable amount of experimental work was carried out in various Allied countries with a view to maintaining the power output of aero engines at high altitudes.

So far, no details of this work have been published beyond a few references to the fact that Prof. Rateau had designed an exhaust-driven turbo-air compressor designed to supply air at normal ground-level density to aero-engines at high altitudes.

According to an American Journal—the "Aerial Age Weekly," of New York—the American authorities took up this question, and, working along lines laid down in Europe, secured very promising results.

Soon after the American declaration of war against Germany, the U.S. Government requested Mr. E. H. Sherbondy, and Dr. Sanford A. Moss, of the General Electric Co., of America, to take up the investigation of this problem

Both these gentlemen finally adopted the main lines of the Rateau system—to the extent of utilising a turbine driven by the exhaust gases of the engine, made to drive a turbo-air-compressor which supplies air to the carburetters of the engine.

Mr. Sherbondy made certain experiments with a compressor gear driven from the engine shaft, but eventually abandoned this method for the turbine drive.

"Aerial Age Weekly" publishes general arrangement drawings of the original Rateau supercharger, and of the Sherbondy modification, together with a number of other illustrations.

Generally all three types differ only in detail. All employ a turbine of the single wheel and expanding nozzle type associated with the name of de Laval, which drives a centrifugal air-compressor on the same shaft at some speed round about 30,000 r.p.m., and a mechanism more or less similar in principle to the ordinary aneroid which controls the exhaust gas admission to the turbine in such a manner as to maintain an approximately uniform pressure on the delivery side of the compressor.

Fig. 2, attached, shows diagramatically the *modus operandi* of all three systems.

Fig. 4 is a general arrangement of one of the Rateau superchargers showing the disposition of the turbine and the compressor.

Fig. 5 is a similar view of the Sherbondy supercharger. In this figure A is the air compressor-impellor, mounted upon the shaft S, which also carries the turbine rotor B.

Exhaust gases are led by two special manifolds to the annular chamber N, and passing through the nozzles R, impinge on the turbine buckets K and pass to the exhaust outlet E. Between N and E is the bye-pass valve V. The bye-pass valve is controlled by the diaphragm F, which is open to the atmospheric pressure on one side and has on its other side a sealed chamber containing air at normal atmospheric pressure.

Movement of the diaphragm with varying external air pressure controls a small piston valve O which opens or closes oil ports leading to a cylinder whose piston P is on the stem of the bye-pass valve V.

At ground level this bye-pass is wide open and no exhaust gases pass the turbine nozzles. As the altitude increases and the external pressure on the control diaphragm decreases the bye-pass is progressively closed, more and more gas passes through the turbine, and the speed of the turbine-compressor unit is automatically regulated so as to maintain the required pressure in the induction pipes.

Air enters the compressor through the intake G and is driven by the impellor A into the circumferential chamber C, and passes to the induction pipes and carburetters through the outlet J.

The turbine and compressor casings are separated by a water space W which is coupled to the engine-cooling system. In the centre of the shaft and surrounded by the water space is a labyrinth packing system which prevents leakage of exhaust gases from the turbine to the compressor.

Fig. 1 gives a general view of the complete supercharger unit, with exhaust manifolds and carburetter connections as applied to the 12-cylinder Liberty engine.

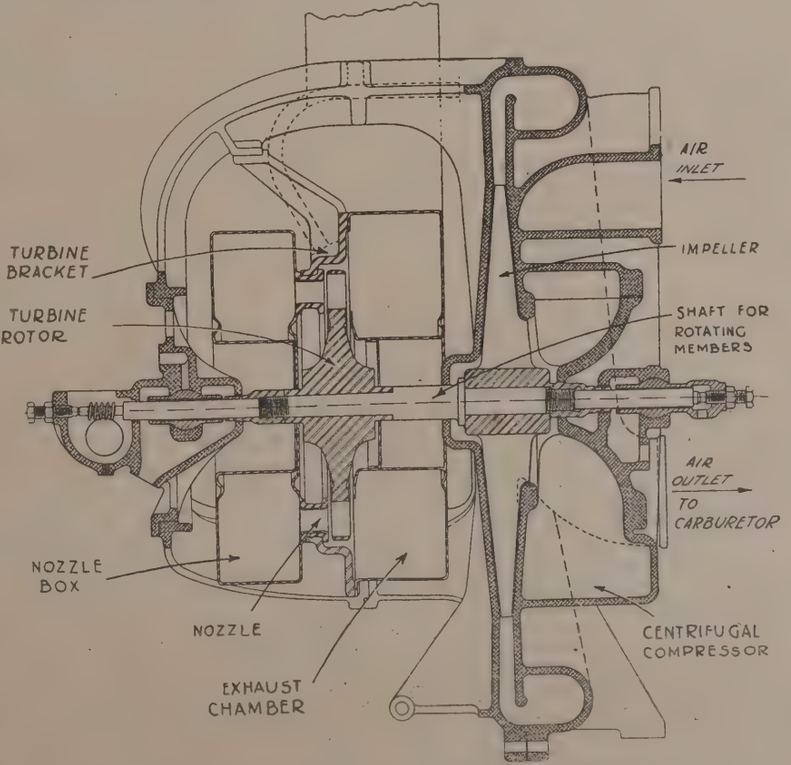

Fig. 4.—Cross-section of a Rateau Turbo Supercharger.

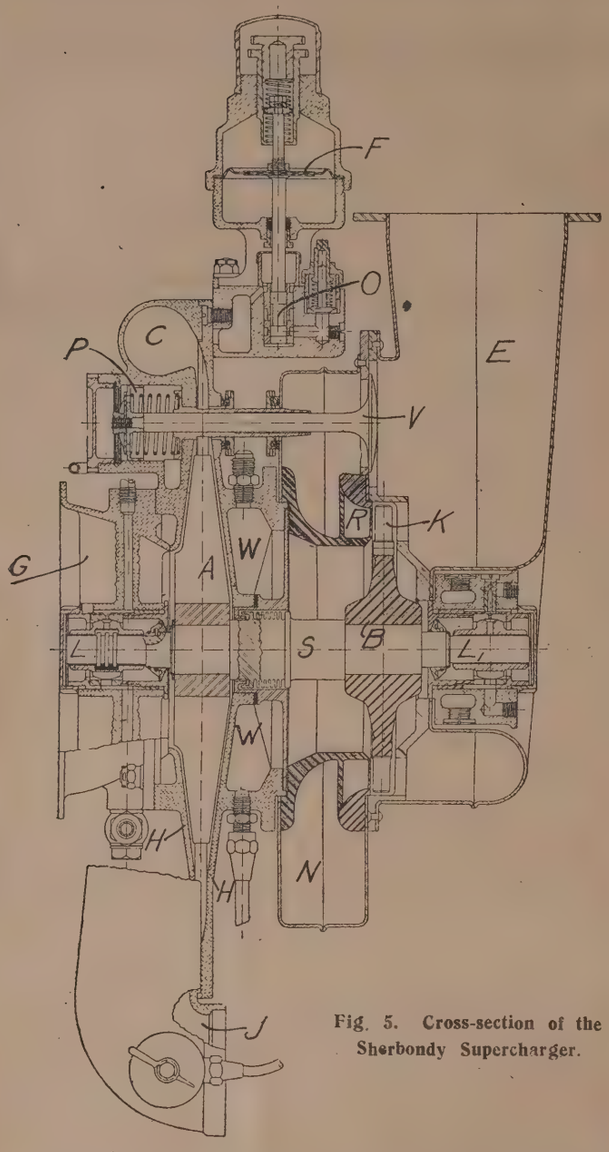

Fig. 5. Cross-section of the Sherbondy Supercharger.

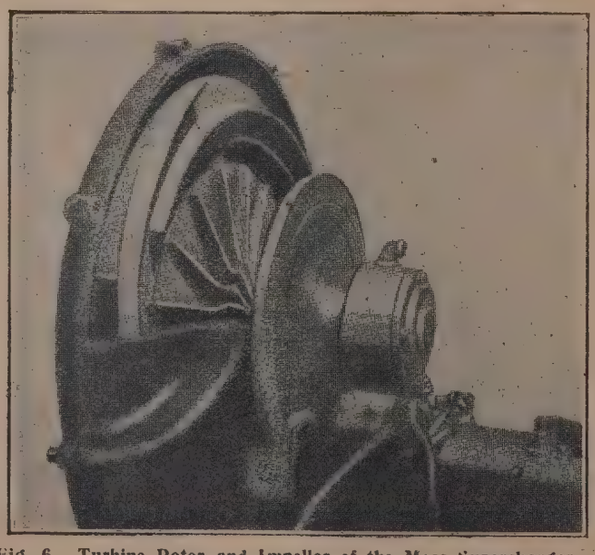
Fig. 3 shows the turbine rotor and the air impellor mounted on the shaft.



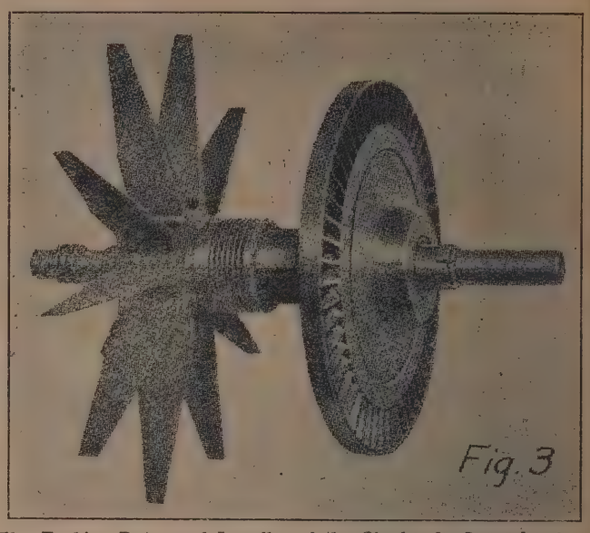


Fig. 6. Turbine Rotor and Impellor of the Moss Supercharger.

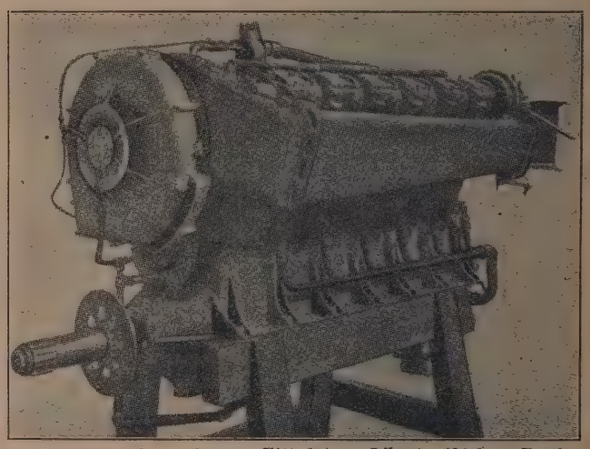

The Turbine Rotor and Impellor of the Sherbondy Supercharger.

The Moss supercharger differs from the Sherbondy mainly in detail.

Fig. 6, which shows the turbine wheel and the impellor, together with part of the compressor casing, shows the general similarity of lay out. In this case the rear shaft-bearing has been water-jacketed to minimise the effects of its close proximity to the exhaust gases, and the casings of the turbine and the compressor are separated to allow air circulation between the two units.

Both the types described above are designed to preserve full air supply to the 400-h.p. Liberty engine up to 20,000 feet.

The Moss Supercharger Fitted to a Liberty 400-h.p. Engine.

A GIANT SEAPLANE.

According to a note in "Engineering," Vickers, Ltd., are at present engaged upon the design of a very large seaplane

This machine is to be, as far as the structure is concerned, entirely of duralumin, and will have a total weight of roughly 50 tons, with a disposable lift for fuel, crew and cargo of 20 tons.

A TRADE MOVE.

Mr. E. C. Newman, for five years connected with the Sopwith Aviation Company, has recently joined the British Aerial Transport Company. Mr. Newman may safely be called one of the pioneers of British aviation, for he started aeroplane work with the Short Bros. in 1908 and was working with the late the Hon. Charles Rolls in Bournemouth when that pioneer pilot was killed. After the death of Mr. Rolls, Mr. Newman went to the Crystal Palace, where he joined the late Mr. Moissant, the American aviator, who had just arrived there from Paris on a two-seater Blériot.

Mr. Newman went to America with Mr. Moissant, and was with him when he was killed at New Orleans. He stayed on in America working with Mr. J. A. D. McCurdy, the pioneer Curtiss pilot, and returned to England in 1912, where he joined the Bristol Company. He worked with them for a considerable time at Brooklands, and he joined the Sopwith firm in 1914, where he has since been concerned with the tuning up and testing of the experimental machines. His long and wide experience of experimental work should be of very great value to Mr. Koolhoven and the B.A.T. Company.

THE WILBUR WRIGHT MEMORIAL LECTURE

(Continued.)

Engine Weight and Supercharging.

When saying that an engine weighs 2 or 3 lbs. per horse-power it is common practice to use the maximum horse-power the engine can give continuously. In designs as they now exist, this maximum power is usually developed at ground level. The power developed during high flying is less than this maximum and in fact is about half of it at 15,000 feet where the weight per horse-power is 4 to 6 lbs. Attention has been drawn to methods of keeping up the power of the engine, and two main lines of progress show promise. In one of these the design is based on high altitude conditions and the full power development at the ground prevented; in the other a blower is provided which increases the air taken into the cylinder at high altitudes. The exhaust turbine, developed by Rateau for this express purpose, has now reached an advanced stage of development. The weight of the blower and the power necessary to drive it must be offset against the increased power due to greater charges, and although an important reduction of engine weight below 6 lbs. per horse-power at 15,000 feet may be expected, the limit will always be above that quoted for ground level.

Airscrews.

The consideration of airscrew design for supercharged engines brings into prominence a very useful but somewhat accidental balance between the output of power of a non-supercharged engine and the power required to drive the airscrew. Some of the important stresses in an engine arise from centrifugal forces, and for this and other reasons a limit is put by makers to the maximum permissible speed of rotation to the crankshaft. The combination of aeroplane, airscrew and engine with which we are best acquainted goes a very long way towards a natural arrangement for the prevention of excessive speed. The balance is very seriously disturbed if a supercharged engine, which maintains constant horse-power from the ground to 15,000 feet, is used. An idea of the magnitude of the change of speed can be obtained from a simple formula which says that the horse-power for flight in the neighbourhood of normal top speeds varies as ρV^3. For constant power the aeroplane speed and airscrew revolutions will be $\sqrt[3]{2}$ times as great at 15,000 feet as at the ground. This is an increase of 26 per cent, or from 1,400 to 1,760 r.p.m. and would be many times the excess allowed for good running. It will be noticed that the effect of supercharging an engine is to convert a small loss of speed with height into an appreciable gain.

In order to deal successfully with the supercharged engine when it arrives, it will be necessary to abandon fixed airscrew blades and to have a device which admits of the adjustment of pitch during flight. In civil aviation there will be time for the operation by hand of the necessary mechanism. Satisfactory methods of holding wood blades in metal sockets have been developed and it is not improbable that the work of operating the variable pitch mechanism can be thrown onto the engine. There appears to be every reason to think that the difficulties are well within the reach of engineers and will be overcome whenever the demand becomes sufficiently insistent.

A discussion of some importance has been raised by the conflicting requirements of airscrew designers and engine makers. It is apparent from the trend of engine design that crankshaft speeds of 2,500 r.p.m. are contemplated in order to reduce weight per horse-power. On the other side, the airscrew designer finds a loss of efficiency of the airscrew which becomes serious at high speeds and much greater than any gearing losses in the engine. If, for civil flying, it may be anticipated that the engine unit will have a horse-power of about 400, the gearing for a "tramp" aeroplane should bring the airscrew revolutions down to 1,000 or 1,200 r.p.m. If necessary, four-bladed airscrews can now be used, and the slow rotation and large diameter will not only tend to high efficiency but probably also to quieter running.

The use of ungeared engines and large powers was bringing a new feature into airscrew design. Tip speeds of 600 ft. per second are not uncommon even with gearing, and airscrews have been used with tip speeds in excess of 850 f.s. On theoretical grounds it was expected that changes in the type of air flow from an airscrew would appear at about 500 f.s., or roughly half the velocity of sound in air.

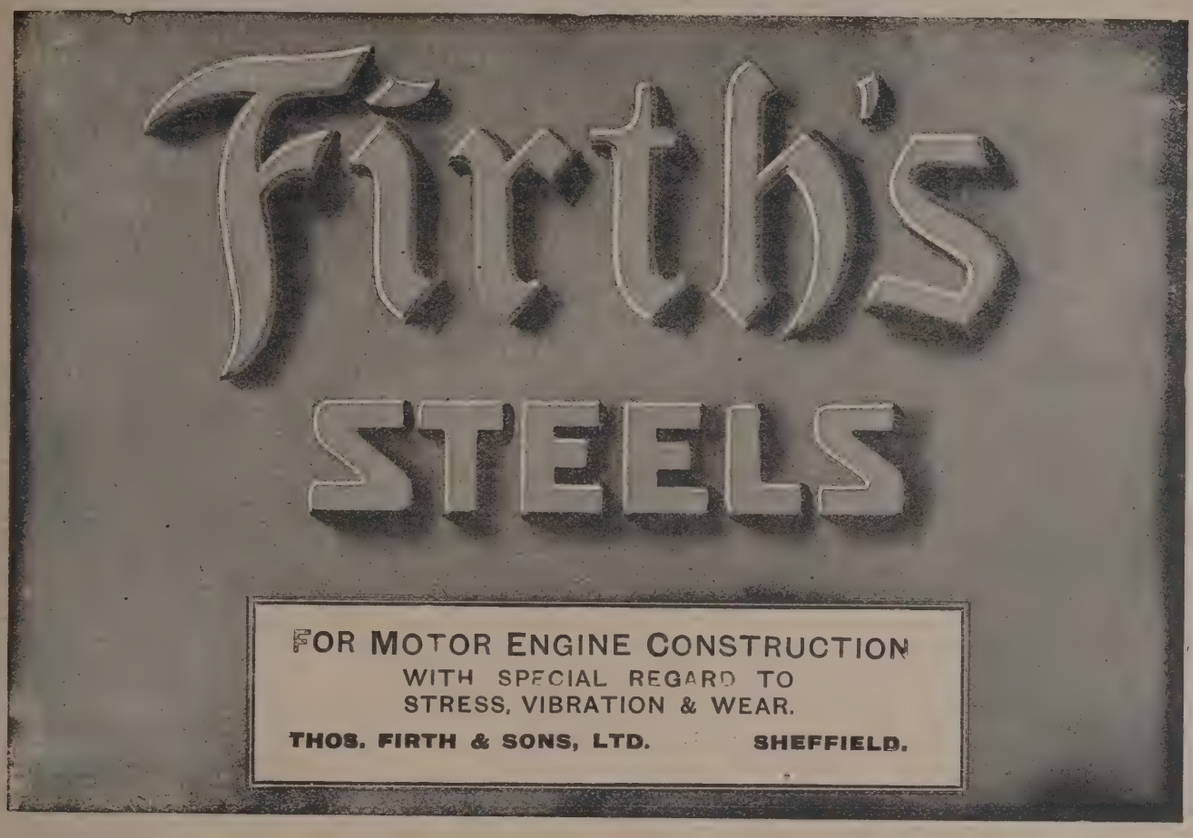
The importance of the subject was becoming very great in the closing period of the war and a special design was made at the Royal Aircraft Establishment which could be rotated on a spinning tower at speeds up to nearly 1,200 f.s. The results obtained were very striking, the simplest of observations sufficing to indicate a great departure from the type of flow on which normal airscrew design is based. Standing in the rear of the airscrew, the usual strong breeze was felt at speeds below 900 f.s., but disappeared before the top speed of 1,160 f.s. was reached, leaving a region of comparative calm. The change was noticed more readily on shutting down owing to the suddenness with which the slipstream made is reappearance. The phenomenon was investigated and it was found that the new type of flow was largely centrifugal, whereas the normal flow resembles that of a jet of rather less diameter than the airscrew. There was no sudden increase in the rate of variation of power with speed, but considerations of momentum suggest that almost the whole of the thrust had disappeared. As an organ of propulsion, the airscrew was probably very inefficient.

An experiment in flight with an airscrew having a tip speed above the velocity of sound has been contemplated, and this is one of the cases in which flight on an aeroplane presents the only available means of progress. It will be a difficult experiment, but is accepted by the experimental pilots because of its value. I should like to add my personal tribute to the courage and skill of the members of the Experimental Staff and Flying Squadron at the Royal Aircraft Establishment. In one instance in particular, loss of life occurred in a very direct attempt to assist in urgent design. An accident of which the cause was particularly obscure had recurred and an investigation was being made. The Royal Aircraft Establishment was approached for assistance and completed a valuable report; when the last records were being taken the aeroplane came to grief by a repetition of the accident which they were investigating. Both pilot and observer lost their lives.

Factors of Safety.

I am not going to deal with the calculations made when estimating the load which an aeroplane can safely bear, but to draw attention to the loads which may come on it due to its motion through the air. A further difference between military and civil flying is shown in the process, and it will be seen that the fighting pilot carried out his work under exciting conditions during which his aeroplane was subjected to severe strain, and in which his physical sensations must have added considerably to those due to the presence of an enemy.

The forces on an aeroplane can be measured by an instrument called an "accelerometer." Although it has a good scientific name it is a very prosaic instrument which measures the heaviness with which a pilot sits on his seat. Ducking the nose of the aeroplane tends to throw the aviator out, and at the moment at which he loses his seat the instrument reads zero. During a loop it may indicate that instead of a real weight of 10 stone, the pilot's apparent weight is 40 stone. His head is then very heavy on his shoulders, and on the one occasion on which I experienced the sensation my head was distinctly unstable, and an incautious movement brought it forward "cut of control."



The first record occupied nearly half an hour in the taking, of which about twenty minutes was in the air. The instrument was strapped to the knee of an observer, and at intervals the pilot interposed some of the trick evolutions of flying on the more normal course of the flight. The first clear deduction from the record is the uneventfulness of straight flying, especially at good heights. This is shown by the tendency of the black line to keep about the value 1, so that the pilot and passenger have their usual weight. Flying low down the changes called "bumps" sometimes reduce a pilot's apparent weight to half its ordinary value, and at other times increase it to nearly one and a half times.

Leaving the record of ordinary flight and coming to the "stunts" it was found that on two occasions the pilot was in danger of leaving his seat, and the importance of a belt will be appreciated. Looping and spinning produce heaviness on the whole, the extreme value being nearly three times the normal. A rapid turn almost always increases the apparent weight, and in a mock fight it is very noticeable that the greater number of manœuvres seat the pilot more solidly, and therefore help in the accurate control of the aeroplane's motion. In a few instances and for a few seconds the apparent weight is zero, whilst the extreme in the other direction is as great as four times the normal.

Periods of high stress do not last long, but the air forces have been fully transmitted through the structure, which is then liable in fighting to be loaded to four or five times the load in level flight. Although the conditions of fighting are very exacting, the demand for adequate structural strength has been met with considerable success. It would therefore appear that for civil transport structural design is far advanced towards complete safety.

Controls.

Control is difficult to define in numerical form, especially as the manœuvres are rapid; it takes only a few seconds to get from a level keel to a vertical bank, and the pilot is far too busy to observe a stop watch. At the Royal Aircraft Establishment the idea was formed and developed of photographing one aeroplane from another. The cinema camera used was carried on one aeroplane which flew steadily along a straight level path; the film was driven by a small windmill. Directed towards a second aeroplane flying behind, any motion, such as turning, rolling, or looping, could be photographed. The latest stage of the experiment is to use simultaneously a number of instruments bearing the undignified title of "Rats," which record the movements of the controls during the manœuvre. The scheme will only be outlined this evening as a full description will shortly

be given by the Royal Aircraft Establishment. Given such a method of investigation, it would be possible, even in a fighting scout, to assess the merits of any particular control in a definite numerical statement, and so lay the foundation for the final design of the best systems.

Relay Control for Large Aeroplanes.

With the exception of a few flying boats; the control of all heavier-than-air craft has been by column or wheel and rudder bar connected by cables to the elevator, ailerons, and rudder. This is a partial relay, as the couples which move the aeroplane come from the air and are far greater than those exercised by the pilot's muscles. An aeroplane of a given size may be light or heavy on its controls, and those designs in which the control is light are greatly appreciated. Forces on a pilot's hand of 1 to 3 lbs. are described as light, 5 to 10 acceptable, and 30 to 40 lbs. heavy. Bigger forces can be taken through the legs from the rudder bar. The largest manually controlled aeroplane weighs twenty times as much as the smallest, and, other things being equal, this would represent the increase in the pilot's effort. A small aeroplane with light control may represent a heavy type of large aeroplane. Some relief can be obtained by the use of an adjustable tail plane, but this is too slow for such operations as landing. In meeting the new problems involved in the control of large aeroplanes, balanced surfaces were introduced, and have sufficed to bridge the present range of size—at any rate, for those large aeroplanes which have sufficient stability to fly themselves for the greater part of their time in the air. It might be thought that no limit existed to the possibilities of balancing, but it is found that the conditions required are not the same at all speeds of flight. It is important that the controls shall not "take charge," due to overbalance, and so a small reserve of stability of the control surface is necessary. A more important but less obvious limitation arises from the fact that the atmosphere is gusty, either naturally or because of the airscrews. This gustiness upsets all hope of accurate balance, as the irregular forces on the pilot's limbs lead to discomfort. Some appreciable degree of stability in the controls is thus indicated, and as a corollary it is necessary to look to new ideas. The most promising development is one which assists the pilot in the same way as the steering engine of a ship assists the helmsman. The stage of finality is still distant, but one control has been developed and used for seaplanes which relieves the pilot of three-quarters of the effort required to move the ailerons.

Stability.

The relay control just mentioned only assists the pilot and does not remove the necessity for his constant attention. The human being is a complex mechanism onto which aeronautics throws all its outstanding difficulties, and, although the opinion is probably heretical, I believe that pilots are not anxious to do unnecessary work. At any rate, one of them had the normal human characteristic and fixed a plate in the wind which was to operate the relay control when one wing went down and sideslipping began. He discovered a natural period of the aeroplane. Every six seconds down came the right wing; the control put over the ailerons and brought it up as expected, but overshot the mark, so that "hunting" occurred until the pilot intervened. It is probable that that natural period had never been suspected, just as early aeroplanes were thought to be free from phugoid oscillations.

These natural periods are indicators of stability, and every aeroplane has its own characteristics. Many records are now available from the Royal Aircraft Establishment and some from Martlesham Heath. In a lecture to this society some years ago I had the pleasure of exhibiting a number of small models made to illustrate the mathematical theory of stability. Most of the examples to-night are taken from flight records, and as such are devoid of any theory. It is perhaps necessary to say this clearly, otherwise the distinction might be missed in the exactness of the agreement.

Two pieces of apparatus, one a simple block of wood, will draw attention to the mechanical ideas which in aviation constitute the basis of stability. Everyone knows that a top-heavy body falls over; an aeroplane may have a property exactly analogous to top-heaviness and a tendency to turn over on its back. The wooden block stands steadily on the table until disturbed, when it oscillates and gradually settles back to its initial state. This is one of the noticeable characteristics of the motion of a stable aeroplane. The other way up, the block is stable against a small blow, but it is upset by a larger one and is typical of a limited range of stability. All these motions are familiar. A fourth type is far less common, and the model used to illustrate it is correspondingly uncommon. If I spin the gyro and set the apparatus in a vertical position, it will oscillate slowly, the amplitude getting greater and greater until the apparatus falls over. This is the condition known to engineers as hunting. I propose to show a record taken on an aeroplane which hunted.

Stable Aeroplane.

The figure (not reproduced) shows a speed record taken by an automatic apparatus attached to an aeroplane. A special clutch was provided, by means of which the control column could be locked; the record begins with the aeroplane flying at 62 m.p.h. and the lock just put into operation. As the steady speed for the control position was 73 m.p.h., the aeroplane, being stable, commenced to dive and gain speed. Overshooting the mark, it passes 83 m.p.h. before again turning upwards; there is a very obvious dying down of the oscillation, and in a few minutes the motion would have become steady. The record shows that after a big bump the aeroplane controlled itself for more than two miles without any sign of danger.

Unstable Aeroplane.

The next record is very different, and not so easily obtained, since no pilot cares to let an unstable aeroplane attend to itself. No lock was provided, but by gently nursing the motion it was found possible to get to a steady flying speed with the control column against a stop. Once there, the pilot held it as long as he cared to, and the clock said that this was less than a minute. After a few seconds the nose of the aeroplane began to go up, loss of speed resulted, and stalling occurred. Dropping its nose rapidly, the aeroplane began to gather speed and get into a vertical dive, but at 80 m.p.h. the pilot again took control and resumed ordinary flight.

Further Records.

As an aeroplane may be flown at different speeds, it is necessary to examine the effect of speed on stability, and the next record shows good stability for a modern aeroplane at speeds of 83 m.p.h. to 111 m.p.h. and for conditions more onerous than those of a locked control column. The records were taken by the equivalent of a pinhole camera carried by the aeroplane and directed towards the sun. The pilot started the record by putting the nose of the aeroplane down and then abandoning the control column. Big oscillations were produced which died down with considerable rapidity. All records show marked damping, and without measurement it is difficult to detect any effect of speed. In another record, which is uncommonly interesting, the effect of speed is obvious. The upper diagram shows that at a speed of 100 m.p.h. and a height of 10,000 ft., the aeroplane is satisfactorily stable. During one period the pilot did his best to fly level, whilst for another the aeroplane was left to its own devices and proved to be a good competitor to the pilot. At a speed of 90 m.p.h. at 1,000 ft. the oscillation died down for the few first periods and then became steady. The stability in this condition was very small indeed, and a reduction of speed to 70 m.p.h. was sufficient to produce hunting.

The oscillations so observed are calculable, and the effect of gusts in a natural wind are readily deduced from the oscillations observed in still air. It is to be hoped that the stability of the aeroplane will now receive the attention which has in the past been devoted to performance, and has led to a British literature unparelleled in any other country in the world. It is easy to make an unstable aeroplane; it is not difficult to make a very stable aeroplane. On the other hand it needs considerable care to give an aeroplane a desired degree of stability.

Once it is conceded in the necessary official quarters that the study of stability is important, there will be no difficulty in beginning the progressive collection of data, but if this work is to proceed satisfactorily it is necessary that an appreciable part of the time of the staff of the National Physical Laboratory and the Royal Aircraft Establishment shall be continuously devoted to it. Incomparably more laborious than that relating to performance, it is work which can only be broken into at frequent intervals at a cost of serious loss of time and accuracy, and in the days to come, when the number of aeronautical engineers with mathematical knowledge is sufficient for the needs of the industry, this data will be fundamental stock-in-trade. The immediate needs of the industry have much support, but a policy of looking two or three years ahead has fewer advocates, in spite of the fact that such provision is necessary if Britain is to keep her lead in the air.

LONGITUDINAL STABILITY.

The following letter has been received:—

Sir,—I have noted from your recent issues some articles by C. W. Tinson on the subject of longitudinal stability; these articles are very misleading, and contain considerable inaccuracies.

It is impossible to discuss the subject fully in a letter, but Mr. Tinson's error is most noticeable in his last article, where he shows the conditions in a terminal nose-dive, omitting the main plane moment, which is of considerable magnitude, even at the angle of no lift. The conditions he works out for the resistance weight and tail plane couples could not, of course, produce equilibrium.

I do not know if Mr. Tinson has access to official publications, but if he has, I would refer him to Confidential Information Memorandum No. 22, which was published by the Admiralty in February, 1917. This covers the conditions of loads on tails in high-speed flight, particularly the conditions for a terminal nose-dive.

It may be of assistance in reading this C.I.M. to note that coefficient Kq used therein is the same as the Km of present-day use, and that the value of Q (i.e., $KqpAv^2$) is negative in a nose-dive.

Another Victory for Burberry!

For the Transatlantic Flight Capt. Sir J. Alcock and Lt. Sir A. Whitten Brown chose BURBERRY CARAPACE AIR-SUITS as the most perfect equipment for securing the warmth and protection essential to the success of their undertaking.

Both Officers, on arrival in London, enthusiastically endorsed the manifold advantage of these suits, and stated that they kept them perfectly warm and comfortable throughout their flight without the assistance of any form of electrical heating.

BURBERRY CARAPACE AIR-SUIT

Illustrated Catalogue & patterns Post Free.

is made up of three layers, each of a different material, scientifically combined to ensure the greatest possible resistance to wet or cold.

The outside is Burberry Gabardine—the material chosen by Sir Ernest Shackleton for all his Polar Expeditions—so densely woven and proofed that it will withstand intense pressure from wind or rain.

The second layer is in the form of soft, thick Fleece, that supplies a wealth of warmth, yet is extremely light.

The innermost lining is a Glissade a smooth-surfaced material, which enables the airman to slip into or out of the suit with celerity.

The suit is reinforced by a double plastron of Burberry Gabardine across the chest and shoulders. A Burberry Puttee Collar, an adjustable waist-belt, and devices for lightening the sleeves and legs, add comfort and stability to an outfit which, whilst ensuring complete security against bad weather and rapid changes of temperature, is naturally ventilating and much less weighty and cumbersome than leather equipment.

MARKET TOPICS.

PRICES ARE FOR QUANTITIES ON USUAL TERMS.

JUNE 26th, 1919.

COPPER.—This market has, during the past week, been very active, and prices have made a fairly substantial advance. It has been pointed out on two or three occasions recently in these reports that immediately the demand for Copper revives values would begin to harden; the present advance, however, appears to be a little premature, as consumers are not making heavy purchases, and the present prices are undoubtedly due to American movements.

Consumers are, of course, showing much more interest in the market, and there are good signs of improvement. The situation at present calls for great care and watchfulness, as the high level of values has made the market a little sensitive. English B.S. Ingots are scarce, and prices are very high. Strong Sheets have also advanced during the last 10 days from £114 to £121 per ton.

COMPARATIVE PRICES.

	Per Ton. £	s.	d.
To-day, June 25th	87	5	0
Last week	84	0	0
Last month	79	7	6
Average price, 1918	115	10	0

TIN.—At the present time prices are steady, but the demand from consumers is not large, and the market is being influenced by the lifting of the embargo on imports into U.S.A., and the expected signing of the Peace this week-end.

It should be pointed out that although the American embargo will be lifted on June 30th it is not expected that permission will be given for the importation of Tin before the end of July.

It is reported that Eastern Tin has recently been sold at prices below the London market. The future of the market is uncertain, but it is not expected that there will be a serious rise.

COMPARATIVE PRICES.

	Per Ton. £	s.	d.
To-day, June 25th	242	10	0
Last week	243	0	0
Last month	245	7	0
Average price, 1918	329	10	0

LEAD.—This market is in a weak condition, and buyers are afraid to buy far ahead, their action being due, primarily, to the huge stocks which the Government still hold, the approximate quantity being 120,000 tons. There is no guarantee that the Ministry of Munitions may not suddenly decide to turn the metal into cash, even if it is sold at a price less than the present market value; it is, in fact, known that they have recently accepted a special price of £23 per ton for a large quantity.

This kind of thing will certainly not encourage confidence; on the other hand, it has already damped the little interest which was being shown by consumers. Yesterday prices were £22 5s. net.

STEEL.—This market is still in a state of uncertainty, uncertainty of labour, hours, costs, prices. At the present time the Teeside Steel works are on strike for a 44-hour week. The outlook is very perplexing and obscure, and Steelmakers are faced with very severe competition from U.S.A.; also reports are continually being received of large orders being secured by American firms in foreign and Colonial markets.

The market, of course, is in a very unsettled position; buyers cannot obtain firm prices, and rather than cover their future requirements at an indefinite price prefer to live hand-to-mouth.

TIMBER.—Consumers continue to show interest in this market, although there is a feeling of uncertainty, which is probably due to the freight question and the apparent shortage of certain classes of Timber. Timber merchants have now combined with the object of forcing down the present shipping rates, and the action they have taken should certainly result in the rates being reduced.

There is a serious shortage of Aeroplane Spruce, and constructors should watch their stocks very carefully indeed, as there are no signs of supplies coming forward at present. There must, of course, be large quantities on the other side. There is a very strong demand for Hard Woods, but very little Timber is arriving recently; consequently, prices are hardening, and there are no indications that they will decline to the low level which they have reached since the Armistice was signed.

A very serious fire occurred in Manchester recently, and it was estimated that over 1,000 standards of Timber were destroyed, including some very valuable stocks of Hard Woods. This is very serious, indeed, as the shortage of Timber is likely to become acute, if the expected demand is realised. It should be pointed out that the whole of the Timber destroyed was Government stocks, and it is understood that every stick could have been disposed of a short time ago, if the Government prices had only been reduced a little.

FABRIC.—As stated last week, the whole of the Aeroplane Linen held by the Government, has been sold to Mr. Martin, and it transpires that the price is in the vicinity of the figures indicated in the last issue, viz., 1s. 8d. per lineal yard. It is also reported that Mr. Martin proposes to sell the Fabric at 2s. per lineal yard.

This is quite a reasonable price, and even if Aeroplane constructors are proposing to use cotton fabric on their commercial machines, it is not expected they will be able to purchase supplies at anything approaching this figure. The quality of some of the linen fabric is very poor, indeed, and intending buyers should be very careful before making purchases.

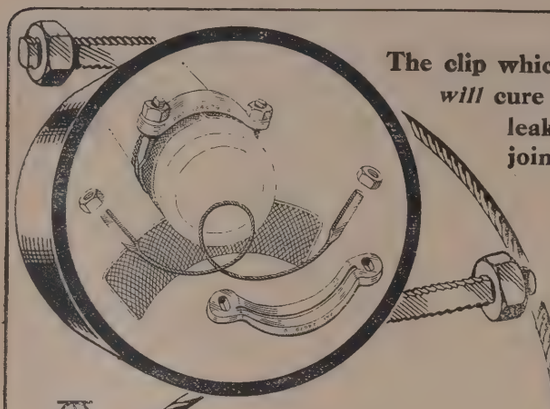
Although the Ministry are complimenting themselves on having effected a good deal in the interests of the taxpayers, it should be noted that they have omitted to point out that the Fabric must have actually cost the Government 2s. 9d. per lineal yard, and the actual loss between the price paid and the price obtained from Mr. Martin must be just over £2,000,000.

It is not, of course, inferred that the Government could have disposed of the Fabric at the price which was paid, but at the same time, the price obtained is not very handsome, and taking all things into consideration, the Ministry should not consider themselves entitled to any compliments.

THE PLACE FOR PRESENTATION PLATE.

So many people connected with aviation have had dealings one way or another with the Goldsmiths' and Silversmiths Company, Limited, that it is probably of general interest to the readers of this paper to know that the Swords of Honour presented by the City of London with the Freedom of the City to Admiral Sir David Beatty and Field Marshal Sir Douglas Haig at the Guildhall on June 12th were designed and manufactured by the said Goldsmiths and Silversmiths Company.

Probably of considerably more interest to the aeronautical community is the fact that the aforesaid firm are still specialising on making silver models of various types of aircraft for presentation purposes. During a recent visit to the firm's shop in Regent Street one noticed some extraordinarily fine examples of such models. There was one large and very perfect B.E.2b; another of the ancient Grahame-White biplane known as "Lizzie," which had been built to the order of the father of a flying officer who had learnt to fly on that particular machine. There were two small and very pretty specimens of Vickers' Fighters, and a beautiful little model of an early R.E.8 which had been presented to the Hon. Mrs. Dawnay, of Hillington Hall, by sundry grateful flying officers who had the good fortune to be sent to Hillington when Mrs. Dawnay was running it as an R.F.C. hospital. This particular model had been damaged in an accident, and had just been rebuilt by the Goldsmiths and Silversmiths Company.



These little models do in fact make very much more suitable presentations to people concerned with aircraft than do the ordinary conventional silver cups and such things.

TRANSATLANTIC LUBRICATION.

The Rolls-Royce engines of Capt. Sir John Alcock's Vickers "Vimy" machine upon which the Atlantic flight was made were—as in customary with these engines—lubricated with "Castrol R," and Messrs Wakefield have received from Sir John Alcock a telegram testifying to the excellent qualities of that brand of oil.

B.T.H. MAGNETOS.

It is worthy of note that the Napier "Lion" engine of the DeH. machine upon which Capt. Gathergood finished first in the Aerial Derby was equipped with B.T.H. magnetos, designed and manufactured by the British Thomson-Houston Co., Ltd., of Rugby.

The clip which *will* cure a leaky joint.

Do you use

a water-pipe clip which can be at ached and detached an indefinite number of times, however inaccessible the position—a clip which has a perfectly equal and concentric action at any tension?

The Essential Reserve

IN THE STRUGGLE BETWEEN HEALTH and disease the lack of sustaining food is often the cause of the body's surrender. What is essential is a reserve of strength over and above the needs of the hardest and most trying day's work.

This reserve is supplied by 'BYNOGEN,' which brings strength to every part of the body. It maintains full nutrition by nourishing and revivifying brain, nerves and muscles. 'BYNOGEN' is specially recommended for nervous Exhaustion, Dyspepsia, Insomnia, and all enfeebled conditions.

'BYNOGEN' is a concentrated nutritive food with a most agreeable flavour. It should supplement the daily dietary of young and old. Those who take it regularly withstand the effects of overstrain, and enjoy the delightful feeling of vigour and well-being.

COMMERCIAL AERONAUTICS & CIVIL AERIAL TRANSPORT

A REAL "LONDON" AERODROME.

By "MEDWAY."

The comments recently published in THE AEROPLANE on the subject of the programme and conduct of the Whitsun meetings at Hendon give rise to the consideration of a question of really great importance. Ought we to have within easy reach of London a concern that could really deserve the name of the London Aerodrome, run on truly educational lines for the ultimate purpose of encouraging civil and commercial aviation in general and without any bias towards any particular private interest?

Personally, I am a great believer in publicity, provided it is properly organised. Nowadays no industry or movement, however great, need regard direct publicity as something rather beneath its dignity. A good many years have passed since the present Prime Minister pressed his fourpenny pup on a somewhat reluctant public by advertising a catch-phrase intended to convince everybody that the animal was worth at least ninepence. During the war the works of great artists have been more or less prostituted in order to increase the strength of official appeals to the public to practise economy and finance wilful waste. Patriotism has been inculcated by advertisement. Advertisement exercised a moral force in favour of enlistment, more effective upon many natures than the physical force of the Compulsory Service Act—"What did you do in the Great War, Daddy?"

We have also, as a nation, announced on public posters and public platforms our deep affection for any and all of our Allies, particularly upon occasions when the real public sentiment was, to put it mildly, lukewarm. The natural instinct of the primitive man is to dislike anybody who does him a service. As somebody remarked when a former friend cut him in the street, "I don't know what I have done to annoy him; he doesn't owe me a penny."

TEXTS AS ADVERTISEMENTS.

In short, advertisement nowadays is not merely ubiquitous but universal. Even texts from the Bible are inserted as advertisements in the agony columns of the "Times," if not by the Deity himself, at least by those who believe themselves to be very closely associated with His views and objects.

The possession of a real London aerodrome, properly run for the one and only object of serving as an advertisement for civil and commercial aviation, would be an enormous asset to the movement, and I believe the receipts would be so good that the advertisement would cost less than nothing. This advertisement would begin and end with the programme. The printed programme itself, instead of telling us how Mr. So-and-So was getting on as a motor agent, would contain varied quotations from recognised authorities rubbing in the practical use of aeronautics and at the same time discouraging wild hopes calculated to lead to wild speculation and even wilder execrations when the inevitable result subsequently occurred.

A FUNNY COLOURED INDUCEMENT.

The programme, in the proper sense—that is to say, the programme of events—would, of course, be the biggest advertisement of all. As already suggested in the columns of this paper, every manufacturer and every pilot of an interesting machine should be positively encouraged to take part. Each machine would not be merely indicated by name, but would be described and its capabilities briefly outlined. Only a good effect could be produced on the business man with some capital to be invested if he could be told on decent authority that such and such a machine would carry so many passengers over stages of so many miles with a total operating cost of so much a mile, allowing such and such a rate per mile for depreciation. With this information he would regard the machine, not as a funny coloured inducement to waste an afternoon, but as a possible money-maker in which he could take a serious interest.

BORED WITH JOY.

The movement cannot make an indefinite living simply out of joy-rides. These form a good stop-gap until really permanent propositions mature, but sooner or later the novelty will wear thin. At least half the joy-riders go up solely for the sake of being able to say that they have done it. Many will not trouble to do it twice, except for some definite purpose connected with serious business. Many of those who are quite keen at first will get bored after a few trips. The joy-ride will remain for some time as a section of the business, but it cannot be permanently the backbone of it.

The London aerodrome should be a place at which the seeker after information will meet the man who can give it him, and at which the seeker after pleasure will be given information in a palatable form. The secret of good propaganda is to inculcate ideas that lead to business and at the same time to make people think that those ideas have arisen spontaneously out of their own superlative intelligence.

I should like to see Hendon taken over as an official demonstration ground, either controlled by the Air Ministry or else by, let us say, a Joint Committee of the Royal Aero Club and the Society of British Aircraft Constructors. In the early stages we certainly want to encourage the joy-ride habit, because every man who goes up will talk about it, and, as he talks, will become more and more convinced that the whole thing is quite simple and safe. The joy-ride, however, should not be an end in itself, but only a means to an end, and this end should not be profit of any single firm, whether that firm is mainly concerned with the manufacture of aeroplanes or with the retailing of motor-cars.

It is very easy to get a sound movement discredited by bad handling, or by handling which indicates that a personal profit is the main consideration. We want a broader outlook than this, and I hope we may get it at Hendon. If not, it seems to me we must establish a really good London aerodrome at some other point which must be carefully selected as being easily accessible and situated in pleasant surroundings.

MORE FICTITIOUS FIGURES ON FLYING.

By "BLUE ENSIGN."

"Engineer Officer's" "Fictitious Figures on Flying" are almost as dangerous to aviation as the estimates he decries. Based on his experience they may be accurate, but the writer, who had the honour to serve with the first R.N.A.S. Handley Page Squadron on the Belgian Coast, proposes to point out certain underlying fallacies, and submit an estimate based on actual working knowledge of large aircraft, the efficiency of which, under proper organisation, can be very much higher than is commonly supposed.

The two most serious errors are the selection of an excessive stage run of 500 miles and the small amount of work got out of the plant employed.

Examination of probable air routes shows that stages of 500 miles are rarely necessary or desirable, towns of sufficient size to be used as ports of call generally lying close together; further, a run of five hours' continuous flying is a considerable strain on a pilot, especially in hard weather. A run of 250 miles will reduce the chances of unavoidable crashes and increase the paying load carried by the machines. It may be pointed out that very few runs in excess of 250 miles are made by express trains simply to ease the strain on the engine crew.

"Engineer Officer" says little of his type of machine, but, from his cost figures, it appears reasonable to assume the following:—

Speed, 115 m.p.h.; loadings, 16.2 lbs./h.p., 9.6 lbs./sq. ft.; total weight, 16,200 lbs.; structure at 30 per cent. of total, 4,860 lbs.; engines, four at 250 h.p., at 3.9 lbs. per h.p. installed, 3,900 lbs.; fuel, three hours' full power at 0.5 lbs. per h.p., 1,500 lbs:; oil, four hours' full power at 1 gallon per h.p. engine hour, 160 lbs.; tankage at 10 per cent. of fuel, 166 lbs.; crew of two men and gear, say, 500 lbs.; weight of machine, less paying load, 11,086 lbs.; maximum possible paying load, 5,114 lbs.

Allowing for bulkage and incomplete loads 2.0 tons = 4,480 lbs., appears to be a reasonable estimate.

The writer has seen aircraft worked at an average flying time of 30 hours per month, or 360 hours per year, and is convinced that 1,000 hours per annum can be easily obtained and exceeded in commercial practice; but the question of ease of operation must be kept in view during design; it is no exaggeration to say that at present it is absolutely disregarded.

For the purpose of this article it is sufficient to note that the modern aeroplane, apart from its engine, is a very reliable piece of machinery, and is only responsible mechanically for about 10 per cent. of the failures to undertake or complete a flight, the remaining failures being due to engines. By designing the engine and its installation as a self-contained unit which can be changed in some three or four minutes, an efficiency far ahead of anything at present attained can be reached. Nor does the adoption of such a unit construction present any great difficulty.

"Engineer Officer" makes no allowance for the reduced wear and tear of commercial as compared with War service. Well cared for a machine should last from two to three years, an average life of two years, with an overhaul every six months, should enable a company to maintain its aircraft in excellent order.

The cost of a machine per hour then becomes:—

	£
Cost of aeroplane (new)	10,000
Four overhauls, at £1,500 each	6,000
Scrap value	2,000
Cost per annum per machine	7,000

The cost of engines per hour of flight is the most serious question aviation has to face. The best types of modern aero motors cannot be trusted to average more than 80 hours between overhauls, and after two such overhauls will require extensive replacements.

Further, the load carried by a machine depends greatly on its propeller efficiency, and a total life of 100 hours at maximum efficiency is not likely to be exceeded.

ENGINE COSTS.

	£	Hours run.
Cost of 250 h.p. motor (new) at £5 per h.p.	1,250	80
Cost of first overhaul	150	80
Cost of second overhaul	250	80
Cost of third overhaul, including replacements	800	80
Cost of fourth overhaul	150	80
Cost of fifth overhaul	250	80
	2,850	480
Less scrap value of engine	200	
	£2,650	

FUEL COSTS.

Petrol, 17½ gallons per hour, 8,400 at 2s. 6d., £1,050; oil, 1 gallon per hour, 480 at 5s., £120; total fuel, £1,170; propellers at £40 each, £200; total cost of 250 h.p. for 480 hours, £4,020; cost per h.p. hour, 8s. 4d.; cost per engine hour, £8 4s.; cost per machine hour, £33 6s.

It will be necessary to maintain in store some 100 engines for every 100 actually in machines, but apart from the cost of housing and attention, these do not represent any expenditure on the part of the company so far as cost per machine per engine hour is concerned; to make some allowance for them, however, this cost will be taken at £40 per hour in lieu of £33 6s.

The number of flying days per year must depend on the countries in which the service is worked; to avoid undue optimism 250 is taken as a figure. It will become much higher in time, but, as the rate of development cannot be foretold, a low estimate is advisable.

A satisfactory organisation must obtain the maximum amount of flying from each machine, also, because the one superiority of air transport is speed, the minimum delay at each stopping-place. This should not exceed 15 minutes either for refuelling the machine or changing load. Also, a machine should be capable of flying for 10 hours between examination of the machine.

Supposing a route 5,000 miles long, containing five main stages of 1,000 miles, each of which in turn is divided by refuelling depots into 250-mile stages, it should be possible to run a daily service each way with four machines at each main depot, two on duty, one stand by, and one under overhaul. The four machines between them do 5,000 hours' flying per annum corresponding to 1,250 hours per machine.

The organisation of the route then becomes six main depots at 1,000 mile intervals; 15 sub depots at 250 mile intervals; four machines at each main depot, or 24 machines in all; time for trip, flying at 100 m.p.h., 50 hours; 19 stops at 15 minutes each, 4.25 hours; total, 54.25 hours; total number of trips per annum, 500; hours flown per annum, 25,000; ton miles flown per annum, 25,000, by 100 by 2 = 5,000,000 ton miles.

COST OF WORKING SERVICE

	£
Machines—24 at £7,000 each	168,000
Engines, 25,000 hours at £40 per hour	1,000,000
Pilots, four per short stage and 50 per cent. in reserve, 120, at £500 per annum	60,000
Main depots, six, at £15,000 per annum each	90,000
Sub depots, 15, at £5,000 per annum each	75,000
Insurance ..... say	150,000
Offices, 10 sets, at £3,000	30,000
Hands, 80 per main depot, at £250 per annum each	120,000
Hands, 20 per sub depot, at £250 = 15 by 5,000	75,000
Cars, 20 per depot	42,000
Total	£1,819,000

Increasing this by 20 per cent. in view of the roughness of the estimate total cost is, say, £2,200,000. Cost per ton mile to company, £0.44, about 8s. 10½d. Allowing 30 per cent. profit on above charge per ton mile becomes £0.57 = 11s. 5d.

Cost of passenger tickets per mile, taking one man and gear at 200 lbs., is £0.051 = 1s. 2½d., a good deal less than special train.

London to Liverpool is about 200 miles, representing a ticket cost of £10 2s., say, £17 10s. return.

The cost of speed is always high, and for a service timed at 80 miles per hour in place of 100, the load carried per horse-power, the determining factor of all transport costs, can probably be increased from the 16.2 lbs., assumed, to some 22 lbs.; of this, 1.44 will be absorbed in structure, and 0.5 lbs. in extra fuel, leaving 2.86 lbs. per h.p. extra to go in to paying load. In the machine considered this would increase the load to 7,974 lbs., say, a working load of 3.2 tons, bringing down the cost per ton mile £0.275 and £0.358 = 7s. 2½d., and per passenger mile to £0.032, about 8d.

The most striking feature in the foregoing figures is the cost of engines, a factor that the future will see reduced. The writer is of opinion that his estimate is on the high side, but it is not of the 4s. 6d. a mile for a car order to which "Engineer Officer's" calculations are comparable.

A MODEL-MAKING COMPETITION.

The judging in the above competition, inaugurated by Messrs. Thos. Parsons and Sons, took place at the Exhibition of Famous War Models, 315-317, Oxford Street, on June 3rd.

H.M. Queen Alexandra has graciously consented to accept the First Prize Model in the Senior Section of the Competition, and H.R.H. the Prince of Wales the First in the Junior Section.

The winner of the First Prize of £60 in the Senior Section is Mr. L. F. Rudd, 2, Upper Grange Road, Bermondsey, S.E., with a model of H.M.S. "Princess Royal."

The winner of the First Prize of £25 in the Junior Section is Mr. J. R. Baker, aged 16 years, 9, Whitfield Street, Tottenham Court Road, W.1, with a model of a Handley Page aeroplane.

The prizes in this competition, generously given by Messrs. Thos. Parsons and Sons, amount to £170. Their Exhibition of War Models to aid disabled sailors and soldiers has been a great success—over £10,700 being handed to the War Seal Foundation.

Air Records

When famous pilots like Fonck, Casale, Sadi-Lecointe and France insist on having Lumiere propellers for their record making machines there is a very good reason.

Fonck—29 530 feet

He is going to attempt a climb to over 10,500 metres. Lumiere propeller.

Casale—30,510 feet

Climbed in 41 mins. on May 28th with a 300 h.p. Nieuport 29, and raised the world's record to nearly 10,000 metres with the same machine on June 7th. Lumiere propeller.

Sadi-Lecointe—29,200 feet

Flying a 500 h.p. Spad made the previous record on May 19th, also used a Lumiere propeller.

British Machines

Fitted with British Lumiere propellers could win the world's speed and height records. Try one. Test propellers can be supplied at once.

POWER ALCOHOL AND AERIAL TRANSPORT.

By "MEDWAY."

I have always been adequately impressed with the value and importance of alcohol as a commodity, but my opinion of the particular brand known as "power alcohol" has risen still higher on reading the report of the Inter-Departmental Committee appointed last autumn to consider the subject. The name "power alcohol" is given to a spirit containing 95 per cent. of pure alcohol in order to distinguish it from "powerless alcohol" commonly known as "war whisky." The stronger stuff used to be called "industrial alcohol," but this name has been given up because some of the more strenuous representatives of labour, not realising the true significance of the term, decided in their own minds that industrial alcohol must be something even worse than war whisky, specially produced by the bloated capitalist for the nefarious purpose of poisoning the honest working man of the industrial class

However, enough of names. We must get on to facts. This committee that has now reported has come to some very definite conclusions, and, as the committee itself consisted mainly of Government officials, it may be that the Government will consider its views worthy of casual perusal before being finally pigeon-holed. The committee, many members of which started with no knowledge whatever of the subject, has come to the unanimous conclusion that power alcohol is, or could be, very valuable for fuel purposes, and that consequently a permanent body with funds, powers, and staff should be set up by the Government to get ahead with the preliminary work.

SAMPLING THE ALCOHOL.

This permanent body will no doubt sample all the available brands, after which its view of the question should be rosy-hued if indistinct. It will at least be convinced that it is high time to abolish any customs and excise restrictions which make alcohol unnecessarily expensive or cause it to be denatured with nasty stuff that completely spoils the taste. The present denaturant is wood spirit. Among the suggested alternatives are formaldehyde, pyridine, and tobacco oil. The last may find favour with habitual chewers, but none of the three are commonly used in any large quantities in the more popular liqueurs. I believe there are plenty of Irishmen who will drink methylated spirits. There are certainly coloured races who have a great taste for axle grease, so altogether the problem of rendering power alcohol unfit for human consumption without being positively poisonous is a fairly tough one.

On the staff of the permanent body there will be no great rush for the job of the gentleman who is to decide whether the denatured mixtures are absolutely undrinkable or entirely poisonous. The nation will, however, doubtless hold in honoured memory those who die for the cause.

The next important point in the Report will come as a blow to those of my readers who do not possess aeroplanes. There is no likelihood of any really large quantity of power alcohol being produced in this country from home sources (groans and curses). A paltry hundred million gallons per annum may be got by the synthetic conversion of alcohol from ethylene extracted from coal or coke oven gases. There is very little hope for potato spirit, because the potato has not enough strength to produce more than about 20 gallons of alcohol per ton, and consequently the price would be about the same as that of the worst brandy, the fiery temper of which makes it dangerous to dispute its claim to having been born in 1865.

POWER FROM TREES AND FLOWERS.

The committee tells us that we shall get our power alcohol from tropical and sub-tropical countries, mainly from molasses, maize, and other cereals, and certain trees, flowers, and shrubs. For instance, the flower of the mahua tree which grows in Hyderabad can be collected and delivered to a distillery near by at a cost of 30s. per ton, from which 90 gallons of power alcohol can be distilled. There is no reason why the cost of the raw material should be any higher if we depend on maize or other grains grown in the right places and tended by cheap labour.

It is not seriously suggested that we should set about redesigning all our engines to use alcohol neat. The idea is rather to employ alcohol mixtures in existing engines. Alcohol-benzol about half and half will give about the same power and consumption as petrol, but might be troublesome for starting in cold weather. Alcohol-ether is a likely mixture for aerial use. The ether is obtained from the same materials as the alcohol and in the same distillery, and does not add much to the cost. It is thoroughly volatile, and there ought to be nothing against this fuel as a standard for our Imperial air routes.

Now we come to the real beauty of the whole position. I suggest seriously that the air routes ought to be outlined so that the intermediate landing grounds are in the majority of cases placed where alcohol crops can be grown extensively and cheaply. The aeroplanes would start off from England with supplies of synthetic alcohol. At points on the way they would pick up fresh supplies of alcohol distilled locally, the cost of which would be extremely low, because there would be nothing to pay for freight or distribution.

FOOD FOR LAND, OR PIGS.

The distillery would be next door to the aerodrome. The method of cultivation would no doubt involve the rotation of crops, so that the districts would become self-supporting in the matter of food. Personally I know nothing whatever about the rotation of crops, but I hazard the above statement for what it is worth. I believe also that the waste stuff from the distilleries makes very good food either for land or for pigs, I forget which. In either case the ultimate result is much the same. Anyhow, the crops would rotate all the time, and not merely after the consumption of the alcohol.

My distillery-aerodromes would, I feel sure, be extremely popular. Things would go swimmingly. There would be a big tap for filling the tank and a small tap for filling the pilot, and the gentleman inside the distillery would have been induced by monetary considerations to forget to put the denaturant into the stuff that came out of the small tap. This would be an obvious precaution. The life of the pilot working the Imperial air routes would be a short but a merry one. His cargo including films of interesting topical events, he would have a thoroughly up-to-date cinema show to attend in the evenings. The district would soon become a populous one. There are lots of people who would invent reasons for living in it. Besides, it would be within a few hours of London or Melbourne, or both, and there would be a mail service every couple of hours or so. In fact, it would possess overwhelming attractions as a week-end resort.

EARL ALCOHOL OF ETHER.

Altogether, if my readers will take the trouble to extract the pure spirit from the mash in this article, I think some at least of them will agree that I have really got on to a great idea and one that will lead to the development of what are at present very remote and unprofitable districts in the British Empire. When the first chain of alcohol distilleries is complete I hope that a free passage along the route will be given to the originator, formerly unknown as "Medway." I look forward to the day when his reply to the toast of "The World's Benefactor" will be received with loud and prolonged cheers—(Hic! hic Hurr-r-r upp!)—during which the recently created Earl Alcohol of Ether will sink modestly into his chair.

COMMERCIAL AVIATION LANDING GROUNDS.

"Automotive Industries" of June 12th publishes the reports made by American Army Aircraft officials on the considerations entering into the location and design of landing grounds for commercial aviation.

Because of the thinner atmosphere in districts located at relatively high altitudes it is necessary to make the landing grounds in such districts of greater length, since the machine will require a longer run before it will gain flying speed and be able to leave the ground.

The U.S.A. War Department has developed a formula from which it is found that at 1,000 ft. altitude a square field with a 600 yd. side is required, whilst at 500 ft. 1,800 yds. is required.

The height of the surrounding country, the character of the soil and the prevailing winds are other important considerations. The point of landing must be at least 1,200 ft. from an obstacle 100 ft. high, and 500 ft. from an obstacle of 60 ft. Large concrete crosses or circles are being used by the Army to mark the fields, so that they can be seen distinctly from a great height.

Hangars should be placed to bear the brunt of the prevailing winds, and act as a protection to the ground and the aeroplanes landing on it.

A GARDEN PARTY.

The chairman and directors of Vickers, Limited, gave a garden party on June 24th at Edgwarebury House, Elstree, the residence of Sir Trevor Dawson, in honour of Captain Sir John Alcock, K.B.E., D.S.C., R.A.F., and Lieutenant Sir A. Whitten Brown, K.B.E.

Many guests brought their autograph books, which kept the aviators busy until tea time. A Royal Artillery band played during the afternoon.

HONOURABLE MENTION.

It is interesting to note that the Vickers "Vimy" (Rolls-Royce) machine in which Capt. Sir John Alcock, K.B.E., D.S.C., and Lieut. Sir Arthur Whitten Brown, K.B.E., made the trans-Atlantic flight were fitted with Lang airscrews.

THE INFLUENCE OF THE AERO ENGINE.

As a result of the alliance of the Siddeley-Deasy Motor Car Co., Ltd., with Sir W. G. Armstrong Whitworth and Co., Lt., the Armstrong-Siddeley car has been introduced with a six-cylinder engine based on the Siddeley aircraft engines with overhead valves and embodying the use of aluminium. The well-equipped chassis is priced at £660.

CIVIL AERIAL TRANSPORT NOTES.

United Kingdom.

HENDON-DUBLIN AND BACK.

On Wednesday, June 25th, Captain Gathergood, of Aircraft Transport and Travel, Ltd., left Hendon at 2.30 p.m. with an Airco 9 machine to take Mr. Gordon Selfridge on a business trip to Dublin.

In spite of a head wind and low clouds in the Irish Channel, Baldonnel aerodrome, Dublin, was reached without incident at 6.30 p.m., including half-an-hour's stop at North Shotwick for tea and weather reports. The return journey was accomplished on Friday, June 27th. Leaving Dublin at four o'clock, Captain Gathergood landed at Shotwick at 5.15 p.m., and after waiting half-an-hour for weather reports, Hendon was reached at 7.15 p.m. Thus the return journey from Dublin to Hendon was accomplished in 2¾ hours' actual flying time.

Very severe weather was encountered on the North Coast of Wales, which necessitated a detour round the coast at about 200 ft., but after leaving Shotwick beautiful weather was encountered and the trip was entirely without incident.

When it is remembered that the distance is about 320 miles, the journey can be considered as a good example of modern high-speed aerial transport.

AVRO FLYING.

A honeymoon journey by aeroplane was chosen by a bride and bridegroom at Chorley Wood, Bucks, on June 26th. On a space immediately in front of the parish church where the wedding took place, an Avro limousine three-seater was waiting, with a silver horseshoe attached to the undercarriage, and after the ceremony and reception the couple took their seats in the machine and started their journey to Fowey, Cornwall, where the honeymoon is to be spent. They arrived at Fowey at 8 p.m.

The bride was Miss Nora Standen, granddaughter of Mrs. Macnamara, of Chorley Wood Lodge, and her husband, Mr. R. Hamilton, of the Indian Civil Service.

Return flights to Folkestone, St. Albans, and on Sunday, June 22nd, to Whitley Camp—two officers wishing to remain in London for Peace Celebrations on Saturday night, and who had to be on Church Parade at Whitley at 10.45 a.m. on Sunday, were able to do this with the aid of an Avro.

A remarkable feat was performed during the week. An American officer, due to return to Germany on Sunday morning received his first dual instruction on an Avro on Tuesday afternoon, and made his first solo flight on one of the ordinary passenger-carrying Avros after only five hours' dual control. The certainty and accuracy with which he flew showed great credit to his instructor, Mr. H. R. Hastings, A.F.C.

The Avro Limousine is doing daily trips over London, the feature of the machine being that women can wear their ordinary hats.

The Aerodrome at Brighton has now been sanctioned, and will be opened in a few days. Those at Margate and Southsea are now open.

Italy.

A regular air mail service has been started between Rome and Naples, with two trips daily from each city. An aerial line will be started between Rome and Palermo in the near future. The trip will take about 4 hours.

Central Africa.

The "African World" states that King Albert has purchased fifteen seaplanes of different types, and has personally contributed two million francs for an experimental service for carrying passengers and aerial mail on the Congo and its chief tributaries.

Argentina.

Maj. A. Kingsley, representative of the Aircraft Manufacturing Company, is making arrangements for the establishment of a service between Buenos Aires and Montevideo, with two D.H. machines, one for four and the other for 16 passengers.

United States of America.

On June 25th a resolution was proposed in the House calling on the Postmaster-General for a statement of facts regarding the loss by the Harriman National Bank, New York, of cheques of the value of £12,000 sterling, alleged to have been destroyed through the burning of a mail aeroplane between Cleveland and Chicago.

Mr. J. W. Harriman, president of the bank, alleges that he wrote several times to the Postmaster-General requesting an explanation why the fact of the destruction of mail was never communicated to the bank to enable it to protect itself, and adds that as he is unable to obtain any explanation from the post office he has been obliged to ask Congress to demand one.

[How very English! Who can doubt our cousinship across the sea.—ED.]

A WARNING.

The Air Ministry stated on June 27th for the information of all pilots that the practice of flying through the Tower Bridge between the high-level footways and the bascules must cease. Any such cases reported in future will be severely dealt with.

AIRCRAFT SALVAGE.

The Aircraft Disposal Board announces that they are offering for sale a large number of aeroplane propellers.

The propellers are all in good condition, but are suitable for engines now obsolete as far as the R.A.F. is concerned.

The prices are 25s. each for two-bladed, and 30s. for four-bladed propellers.

These propellers are for sale over the counter at the Disposal Board's showroom, York House, Kingsway.

The Disposal Board are asking for tenders, on or before July 14th next, for the following aeroplanes:—

Six second-hand Blackburn "Kangaroo" biplanes, each with two 275 h.p. "Falcon" Rolls-Royce engines.

Fifteen second-hand Bristol monoplanes with 110-h.p. Le Rhône engines.

Twenty new Martinsyde Type F.3 biplanes without engines.

Particulars will be found in the advertising columns of this issue.

A HENDON PEACE MEETING.

The Directors of the Grahame-White Co., Ltd., announce that to celebrate the signing of Peace, a special air race meeting will be held at the London Aerodrome, Hendon, on Saturday next, July 5th, when the programme will include a speed contest round the aerodrome pylon course.

The race, which will commence at 4 p.m., will be run in two heats of four laps each, and a final heat of six laps.

The prizes include the London Aerodrome "Peace Trophy" presented by the Directors.

The entrants include:—

1. Lieut. C. Turner, A.F.C. B.A.T. 170-h.p. A.B.C. "Wasp." 120 m.p.h. approx.
2. Capt. P. R. T. Chamberlayne. Grahame-White "Bantam." 80-h.p. Le Rhône. 90 m.p.h. approx.
3. Major C. Draper, D.S.O. B.A.T. (Special "Bantam"). 170-h.p. A.B.C. "Wasp." 125 m.p.h. approx.
5. Major R. H. Carr, A.F.C., D.C.M. Grahame-White "Bantam." 80-h.p. Le Rhône. 90 m.p.h. approx.
12. Major C. H. C. Smith, D.S.C. Bristol Monoplane. 110-h.p. Le Rhône. 110 m.p.h. approx.
19. Capt. D. H. Robertson, A.F.C. Avro. 110-h.p. Le Rhône. 80 m.p.h. approx.
20. Lieut. G. R. Hicks, D.F.C. Avro. 110 h.p. Le Rhône. 80 m.p.h. approx.

It is expected that Mr. Prodger will take part in the contest, and also Capt. G. Gathergood, A.F.C., who will probably use the same machine on which he won the Aerial Derby.

The usual passenger flights and special looping displays will take place during the afternoon, and also on Sunday afternoon.

[One doubts whether the majority of the machines mentioned can safely be allowed to race round pylons on such a restricted course as that at Hendon.—ED.]

B.T.H. MAGNETOS.

The winners of the first and second prizes in the Aerial Derby, the Airco D.H.4R, with a 450 h.p. Napier engine, and the Martinsyde F.4, with a 275 h.p. Rolls-Royce engine, were both fitted with magnetos manufactured by the British Thomson-Houston Co., Ltd.

THE B.L.I.C. REMOVAL.

The head office and works of the British Lighting and Ignition Co., Ltd., have been moved from 204, Tottenham Court Road to Cheston Road, Aston, Birmingham.

The London Depot and Repair Works have been established at 201, Tottenham Court Road.

AIRCRAFT FINANCE

THE ATLANTIC FLIGHT AND THE SHARE MARKET.

If any mercenary enthusiast had expected the successful Atlantic flight to inspire a boomlet in aircraft and kindred shares, he must be very disappointed with the Stock Exchange. The effect on the securities in question has been negligible, if not exactly nil. *Autres temps, autres moeurs.* Events of infinitely less importance have frequently worked wonders in the boosting of share prices.

An Opportunity Missed.

One is thankful in a way, without being really surprised, that the opportunists missed the chance of manipulating a boomlet. It would have been short-lived, and with the pernicious effect inseparable from a five days' wonder of this kind can very well be dispensed with by the Industry. Indeed, one suspects that a revision of the old gag to the effect that no home is complete without a few aircraft shares would sound more cynical than convincing.

Loan Campaign Not to Blame.

It is no use maintaining that the War Loan campaign militated against any spectacular stock market display by aircraft shares. That disability would have proved quite trivial had the promoters and experts in manipulative finance determined to act. They realise that the psychological moment has not arrived, else they would not have allowed the opportunity to slip away.

The Public Attitude Is Responsible.

It may be wondered why this is so, and for answer it is only necessary to consider the attitude of the public towards investing money in aviation ventures. The public has been convinced, principally by the air raids and secondarily by the pleasure shows, of the effectiveness of flying, but as yet the public has not been convinced of the commercial soundness of aerial transport.

Simple Reasoning.

If 5 per cent. is obtainable on British Government loans, which we have all been told constitute the finest security in the whole world, and the investment basis of the rest of the financial structure has been correspondingly changed until a thing you used to consider cheap if it yielded 4½ per cent. on the money laid out, now offers about 6 per cent. or more, what would you demand on an aircraft share?

What the Public Want.

The average investor maintains that in the present stage of development, and in view of the uncertainties of the reconstruction period, the risk attaching to an investment of money in an aviation venture is worth at least 10 per cent., with possibilities. He needs the possibilities badly, and is not at all sure of the 10 per cent. risk, and would squeal loudly if he suffered from a temporary fit of nerves. He is not unreasonable.

The Demonstration of Commercial Possibilities.

Of course, one is referring to an essentially aviation proposition, dependent exclusively on aircraft, and not one of the composite undertakings, or any of the big armament giants who can afford to experiment and develop aircraft in anticipation of the possibilities of the future. This pioneering may be expensive, but they would not take it on seriously unless they were convinced that within the immediate future it will pay.

How long it will be before the shares of purely aircraft ventures will gain in popularity amongst the general public will depend mostly on the conviction driven home by actual commercial success. If, when this eventuates, the popularity was a bit overdone, it would not be a surprise.—W. J. Davies.

CURRENT TOPICS.

The Protection Society.

It makes one hopeful to watch the various phases of the development of the commercial side of aviation. The formation of the Aeronautical Intelligence Bureau is a good thing, and means much. A company limited by guarantee, with not more than 150 members, each liable for £1 in a winding-up, the objective is to write for mutual advancement and protection, to obtain and distribute status information, to promote and oppose legislation, etc.

Some Well-known Members.

If the policy is carried out efficiently the benefits must be substantial. Among the subscribers are R. H. Tetley (Palmer Tyre Co.), F. M. Luther (Beardmore Aero engine), G. A. Mansfield (Motor and Aircraft Supplies Co.), R. Delpech (Triplex Safety Glass), J. F. Inshaw (Auster); and the registered office is 30, Bedford Row, W.C.

Stock Markets Restricted.

Everyone hopes that the big loan operation will be a brilliant success and a speedy one, but somehow there is not the same degree of enthusiasm as when the war was in progress. This is a pity. Probably it would have been better policy for the authorities to prohibit temporarily the amount of other borrowing, most of which is not of the indispensable type. However, if one excludes a few gambling specialities, the Stock Exchange is moribund.

Some Useful Propaganda.

By the way, it is pleasant to note that a financial daily paper has blossomed out with an Aviation Supplement. This is not, strictly speaking, propaganda work, but it should serve the useful purpose of keeping aviation to the fore, and in the course of time results should be beneficial.

Ruston and Hornsby Results.

Ruston and Hornsby is the amalgamation of Ruston, Proctor and Co. and Richard Hornsby and Co., carried through not so long ago, and they have been concerned with aircraft. After providing £40,697 for depreciation of buildings, plant, etc., a dividend of 8 per cent. is to be paid, and £40,000 goes to reserve, leaving £41,000 to be carried forward.

Whitehead Affairs: Winding-up Petition.

In the Companies (Winding-up) Court, before Mr. Justice P. O. Lawrence, a petition for the winding-up of Whitehead Aircraft (1917) was presented by New Pegamoid Co., 134, Queen Victoria Street, E.C., and Hobday Bros., 25, Great Eastern Street, E.C. The petition is to be heard on July 8th.

NEW COMPANIES.

Larkin-Sopwith Aviation Co. of Australasia, Ltd. Private company. Registered June 5th. Capital, £31,500 in 30,000 preferred ordinary shares of £1 each and 60,000 deferred ordinary shares of 6d. each. Objects: to enter into an agreement with H. J. Larkin and to carry on in Australia or elsewhere the business of manufacturers of and dealers in aircraft and accessories, etc. The subscribers (each with one share) are:—A. E. Fisher, 11, Glenarm Road, E. (5), and H. G. Butler, 19, Colle Road, S.E. (23), both solicitor's clerks. First directors: H. B. Larkin, R. J. Turner, and J. T. Leete (all permanent). Registered office: 4, St. Mary Axe, E.C.

Knox and Co., Ltd. Private company. Registered June 6th. Capital, £2,000 in £1 shares. To manufacture and deal in motor-cars, internal-combustion engines, aeroplanes, airships, boats, and conveyances of all kinds. The subscribers (each with one share) are:—H. Knox, 10, Lower Grosvenor Place, S.W.1, aeronautical engineer; T. R. Kitchen, 10, Adolphus Road, Finsbury Park, N.4, manager to Elias Wild and Sons, Ltd. Directors: H. Knox and T. R. Kitchen. Registered office: 180, Piccadilly, W.1.

AIRCRAFT IN PARLIAMENT

The following oral answer was given on June 4th :—

MISS DOUGLAS-PENNANT.—GOVERNMENT DECISION.

Sir ROBERT THOMAS : On the suggestion of the Leader of the House, I beg to repeat the question which I put yesterday as to whether the Government are now prepared, in view of what occurred in the other House last week, to agree to set up a Committee of Inquiry in respect of Miss Douglas-Pennant's dismissal ?

Mr. BONAR LAW : The Government have given most careful consideration to the opinion expressed by the House of Lords that a judicial inquiry should be held into the circumstances in which Miss Douglas-Pennant was removed from her appointment under the Air Ministry in August of last year. The Government see no sufficient reason for departing from the decision already taken by them. The responsibility of instituting such an inquiry must rest upon the Government. It would involve a large expenditure of public money, it would be contrary to the general principles of Departmental Administration, and it would establish a very undesirable precedent, for if an inquiry were agreed to in regard to this lady, who has great personal influence, it would be difficult to justify the refusal to take a similar course in the case of many others who are not in an equally influential position. In these circumstances, His Majesty's Government have decided that they cannot assume the responsibility of setting up this tribunal.

Sir R. COOPER : Is it not a fact that in this case there has been made public the suggestion that there are grave irregularities in this particular Department, and, if that is so, will not the right hon. Gentleman's answer rather confirm the belief, which holds very widely in the public mind, that there is something very bad behind it ?

Mr. BONAR LAW : I am not the least afraid of that belief being entertained. The reasons I have given are quite sufficient. If such a precedent were established, I cannot see where it would end.

An HON. MEMBER : Does not the decision of the Government mean that a Minister has the right, in the exercise of his authority, to destroy, set aside, and abrogate entirely the personal rights and safeguards which are given under the Regulations under which people are serving.

Mr. BONAR LAW : It means nothing of the kind, but it does mean that the head of a Government Department, like the head of every other administrative business, must be free to make changes in regard to those who assist him, if for reasons which seem to him good a change is necessary.

Brig.-Gen. CROFT : Is it not a fact that Miss Douglas-Pennant was not superseded, but was dismissed, which is a very different thing ?

Mr. BONAR LAW : I do not think it is possible to argue the question. I believe it was admitted, and Lord Weir had to apologise, as to the method in which the decision was announced, but the point goes far beyond that, and it is whether the officer responsible for the Department is justified in making a change.

Sir R. THOMAS : In view of the very unsatisfactory nature of the right hon. gentleman's reply, and having regard to the very important and even vital letters which have been omitted from the White Paper which has been laid on the Table of the House, letters which affect very materially this case, I beg to ask permission to raise this matter at a quarter-past eight this evening as a matter of definite public importance.

Mr. SPEAKER : The hon. Member has omitted one of the most important words in connection with that Standing Order—namely, the word, "urgent."

Sir R. THOMAS : I beg to add that word

Mr. SPEAKER : The hon. Member can hardly ask me to say this is an urgent matter, because it has been before the House for the last two or three months, and has been discussed here more than once. Therefore, I could not accept a Motion of that sort as being within the Rule which says these matters must be urgent.

Sir R. COOPER : May we give notice that we shall raise this on the Adjournment of the House ?

Mr. SPEAKER : Yes, as often as you like.

* * *

The following written answers were given on June 4th :—

CIVIL AVIATION.—KENT COASTAL DISTRICT.

Mr. JOYNSON-HICKS asked the Under Secretary of State to the Air Ministry whether there is any accommodation for civilian aviation in the South-East corner of England lying between Margate and Deal; whether he is aware that the coast towns there are looking forward to the possibilities of such aviation during the summer; and whether arrangements can be made to utilise a portion of the Manston aerodrome for this purpose.

Major-Gen. SEELY : The answer to the first question is in the affirmative. No requests for aerodrome accommodation in the area mentioned have been received and there have been no special representations as to the possibilities of civil aviation there this summer. There would be no objection to the use of part of Manston aerodrome for civil aviation this summer.

SCOTLAND.

Mr. STURROCK asked the Under Secretary of State to the Air Ministry whether he can now publish the plans formed for the development of civilian flying at stations in Scotland situated to the North of the Lowland line at which the lately issued diagram stopped: whether he is aware of the local feeling on the East Coast of Scotland against the threatened closing down of the aerodrome at Montrose; and whether, in view of the geographical suitability of this station for North of Scotland and Scandinavian traffic, he will, before coming to a decision in this matter, make a personal investigation into the question at Montrose.

Major-Gen. SEELY : The Air Ministry will, of course, gladly examine and endeavour, if possible, to assist any suggestions put forward for the development of civilian flying north of the line in question. At present no such suggestions have been received, with the exception of an inquiry from Dundee. Although the aerodrome at Montrose is being closed down as a service station, it will be available for use later as a civil station. Should the demand warrant it Montrose might become a centre for Scandinavian traffic, but it is premature to make a pronouncement on the matter as yet.

YATE AERODROME (GLOUCESTER).

Mr. RENDELL asked the Under Secretary of State to the Air Ministry whether girls and women who volunteered for work at the Yate (Gloucester) aerodrome have been recently discharged, and why; whether a yet larger number of women not before employed have been taken on in their stead, and why; whether those discharged are receiving out-of-work donation as the result of this method of procedure; if those discharged were regarded as inefficient, how long had they previously been employed without such defect being discovered; why, if the work has diminished at the aerodrome there are now employed a greater number of women than were employed a month ago; and what was the reasons for the unusual methods of business adopted by the Air Ministry at Yate.

Major-Gen. SEELY : I have now received a further report on this matter. The numbers of women discharged and enrolled since April 1st last are as stated in the reply which I gave my hon. friend on May 29th; but I am now able to explain more fully the reasons for the action taken. In April last the work in connection with the construction of aeroplanes at Yate had greatly diminished, and this opportunity was taken to recommend the demobilisation of certain women who were considered inefficient, but with whose services it had not been possible previously to dispense. These women's places had to be filled. A further twelve of the "yet larger number" referred to by my hon. friend were taken on to replace women discharged on compassionate grounds; six were merely converted from the status of civilian subordinate to that of member of the Women's Royal Air Force. At the same time the growth of salvage work has tended to more than counterbalance the diminution of construction work. In reply to the third part of the question, I have no information as to how many of the women discharged are receiving the out-of-work donation. In reply to the fourth part of the question, the answer is that they had an average service of six months.

* * *

The following oral answers were given on June 5th :—

AEROPLANES (GIFTS TO OVERSEA DOMINIONS).

Lieut.-Col. MOORE-BRABAZON (*by Private Notice*) asked the Under Secretary of State to the Air Ministry if he could now state how many surplus aeroplanes now in possession of the Air Ministry, and under what conditions, will be presented as a free gift to the Dominions, India, and the Crown Colonies.

Major-Gen. SEELY : I am glad to say that His Majesty's Government have approved a proposal of the Air Council that a gift of aeroplanes should be made to each Dominion and to India, and that corresponding action should be taken in the case of any Colonial Government or Protectorate requiring machines. The object of His Majesty's Government is to assist the Dominions and India and the Colonies and Protectorates in the establishment of air forces, and thereby develop the common defence of the Empire by air.

Lieut.-Col. MOORE-BRABAZON : Can the right hon. gentleman say if this will apply to any particular types of machines or to all types of machines now in use ?

Major-Gen. SEELY : We hope to be able to meet all the requests for free gifts on the part of the Dominions. It may be that in some cases they will ask for types of which we have none available, but we hope that will not occur and that we shall be able to meet all their requests.

* * *

The following written answers were given on June 5th :—

DEMOBILISATION.—APPLICATIONS FOR RELEASE.

Mr. LUNN asked the Secretary of State for War why the air mechanics attached to No. 20 Balloon Base, Kirkwall, who have been registered for early release since January last, are still kept in the Service; and, seeing that these men are not doing work, and are being kept at the public expense, will he see that their release for civil employment is immediately carried out.

Major-Gen. SEELY : I have called for a Report on the matter, and will communicate with the hon. Member as soon as it is received.

ROYAL AIR FORCE.—PROTECTION CERTIFICATE LOST

Col. GREIG asked the Under Secretary of State to the Air Ministry whether a substitute Protection Certificate or preferably a proper discharge certificate can be issued at once to Joseph Deighan, No. 131463, 30, M'Dowall Street, Johnstone, Renfrewshire, who has lost his temporary Protection Certificate, given him on April 8th, 1919, at Blandford Camp when discharged from the Royal Air Force on medical grounds (his eyes having been injured as a result of blacksmith's training at Halton Camp, Wendover), and who has applied for one without results and who, being unemployed and having a wife and four children, cannot draw either his twenty-eight days' pay and ration money or the out-of-work grant unless he obtains such a certificate.

Major-Gen. SEELY : The letter of application referred to in the question has not been traced, but instructions are being issued to No. 131463 J. Deighan, to report the loss of his Protection Certificate to the Pension Issue Office, Baker Street, W.1, forwarding at the same time his temporary pension allowance book. The Pension Issue Office will then arrange for a fresh Protection Certificate to be issued to him. In the meantime he should apply to the local war pensions committee for financial assistance, and he is being advised to do this.

SENT TO RUSSIA (W. SUTTON).

Mr. T. GRIFFITHS asked the Secretary of State for War whether he was aware that W. Sutton, No. 155451, Royal Air Force, recently at Blandford Camp, has been dispatched to Russia although he never volunteered; and whether he will make inquiries into this case.

Major-Gen. SEELY : This airman was under orders for Russia before the ruling was given that only Regular airmen and volunteers were to be sent. Arrangements are being made to release, at an early date, all airmen (other than Regular airmen) who did not volunteer for Russia.

ALDERGROVE AERODROME (C. McGRUB).

Capt. C. CRAIG asked the Parliamentary Secretary to the Ministry of Munitions whether he was aware that Charles McGrub was lately discharged from the Aldergrove Aerodrome, county Antrim, after having worked there for twelve months; that McGrub had served with the Colours throughout a considerable portion of the War; that many men who did not join the Colours have been kept on at the aerodrome: and whether, in view of the pledges of the Government that they would do all they could for ex-Service men, he will see that McGrub is reinstated in his position at the aerodrome at Aldergrove.

Major-Gen. SEELY : I find that Charles McGrub, after being engaged at the Aldergrove Aerodrome on June 5th, 1918, left work on September 5th. He came back on the 12th of that month, but was discharged with 150 others on May 17th last, as there was no longer work for these men to do. Of the 150 men who have been retained preference has been given in every possible case to ex-Army men.

REGENT'S PARK.

Sir WILLIAM PEARCE asked the Under Secretary of State to the Air Ministry when the completion of the transfer of standard stocks from Regent's Park to Ruislip is completed in September will the buildings in Regent's Park be then removed and the land now occupied be restored to the public.

Major-Gen. SEELY : I regret that I am unable to add anything on this question to the reply which I gave to my hon friend on May 10th. Perhaps he will address a question to the Parliamentary Secretary to the Ministry of Munitions at a later date.

The following written answers were given on June 6th :—

ROYAL AIR FORCE (W. MUMMERY).

Mr. JOHN JONES asked the Under Secretary of State to the Air Ministry whether he is aware that W. Mummery, No. 220892, 1A.C. (attached 99th Squadron, Royal Force), joined the Royal Naval Air Service in 1916, was in France till May 14th, 1919, and on that day was sent from Marseilles to India without any leave; that this man and others with him were never medically examined before being sent to India; and whether it is the practice to transfer men to distant stations in tropical climates without medical examination and without leave.

Major-Gen. SEELY : Inquiries are being made in this case, and I will communicate the result to the hon. Member very shortly

REGENT'S PARK.

Sir W. PEARCE asked the Parliamentary Secretary to the Ministry of Munitions if he will remove the Air Ministry store buildings in Regent's Park immediately the standard stocks are transferred to Ruislip, and restore this open space for public use.

Mr. KELLAWAY : No store buildings in Regent's Park have so far been notified to the Disposal Board by the Air Ministry as being surplus to their requirements.

COMPENSATION FOR DAMAGE BY AEROPLANES.

Sir PHILIP MAGNUS asked the President of the Board of Trade whether he is considering the measures necessary to provide compensation for damage to private property or loss of life caused by any kind of aeroplane, whether in use for commercial, experimental, or other objects.

Major-Gen. SEELY : It is considered that, for the present, compensation for damage to private property or life should be dealt with by the ordinary law affecting damage to persons and property until further experience is gained. The question of compulsory insurance will be considered fully before the new Act is framed, to take effect from January 1st, 1920.

* * *

The following oral answers were given on June 25th :—

WOMEN'S ROYAL AIR FORCE

Lieut. KENWORTHY asked the Under Secretary of State to the Air Ministry what was the numerical strength of the Women's Royal Air Force, officers and other ranks, respectively, on November 1st, 1918, and on June 1st, 1919.

The UNDER SECRETARY of STATE for AIR (Major-Gen. Seely) : The figures are as follows :—

November 1st, 1918, 496 officers, 25,062 other ranks.

June 1st, 1919, 442 officers, 20,419 other ranks.

The figure for November 1st includes 24 officers and 1,543 other ranks Women's Royal Naval Air Service serving at Women's Royal Air Force stations and subsequently transferred to that force.

Lieut.-Comdr. KENWORTHY : Will the right hon. gentleman consider the hastening of the demobilisation of these ladies, in order to give employment to discharged unemployed soldiers?

Major-Gen SEELY : Yes, Sir; that is being borne in mind. The process of reduction is continuing. Of course, the hon. and gallant gentleman will understand that during the very rapid demobilisation of the men of the Royal Air Force we depend principally upon women to carry us through this difficult period.

Mr. HOGGE : Is the right hon. and gallant gentleman aware that the numbers he has given us of those transferred from the Admiralty are different from those given by his right hon. friend the Prime Minister?

Major-Gen. SEELY : I do not think that is so. Of course, there is the difference in date. I think he will find that they are correct. I have gone through the figures myself very carefully.

Colonel ASHLEY : Is the Women's Royal Air Force to be a permanent service or is it to be done away with shortly?

Major-General SEELY : The Women's Royal Naval Air Force does not now exist as such; these were ladies transferred on November 1st to the Women's Royal Air Force.

* * *

The replies to the following questions were not received in time for inclusion in the OFFICIAL REPORT, June 24th :—

ROYAL AIR FORCE.—POST-WAR CONDITIONS OF SERVICE.

Mr. RAPER asked the Under Secretary of State to the Air Ministry if he could now make a statement as to post-war conditions of service in the Royal Air Force.

The UNDER SECRETARY of STATE for AIR (Major-Gen. Seely) : The final consideration of this question is now proceeding and will, I hope, be completed very shortly.

Mr. RAPER : Is the hon. and gallant gentleman aware of the fact that the uncertain state of the future conditions of the Air Force prevents a large number of ex-officers of the Air Force arriving at a decision as to their future career?

Major-Gen. SEELY : I am fully aware that it is a most urgent matter to come to a decision on this question. If my hon. and gallant friend will put down a question in a fortnight's time I hope to be able to give him a full statement.

AIR MINISTRY (STAFF).

Mr. ARNOLD asked the Under Secretary of State to the Air Ministry the number of the staff of the Air Ministry on May 31st, 1919, as compared with the number on the date of the Armistice, November 11th, 1918.

Major-Gen. SEELY : The number of persons of all types employed in the Air Ministry at the Armistice was 4,646 and on May 31st 3,289. It will be understood that the large amount of work due to demobilisation has necessitated the retention of a large clerical staff.

* * *

On June 24th, Mr. KELLAWAY (Deputy Minister of Munitions), in the course of a speech introducing the Estimates for the Ministry of Munitions said :—

At the outbreak of war the British Army had in its possession about 100 aeroplanes. The Ministry became responsible for aeroplane production on September 12th, 1917, when the production had increased to 500 aeroplanes per month.

At the date of the Armistice, that is to say, a period of little more than eighteen months, production had been increased to 4,000 per month. I should like to have dwelt on that figure and what it means.

There is a very romantic story behind this story of aeroplane production, that at a time when raw material and machinery was very largely engaged on other essential war production this country was able, thanks to the ingenuity of its craftsmen and the far-sightedness of its captains of industry, to make so great a step forward in its aircraft production as that, and the improvement in the fighting quality and the safety of the machines was just as great as the increase in the numbers. I think there is no question amongst informed men that during the latter stages of the war this country held the supremacy over her enemy in the air.

That was due not only to the extraordinary fighting spirit and ingenuity of the men who flew and fought the machines, but also to the ingenuity and patriotism of the craftsmen and the employers engaged in that great industry.

Concerning various criticisms upon experimental supplies, Mr. Kellaway said :—

Many of these experimental supplies had never been made in this country; they were absolutely foreign to our industrial practice. They included such things as poison gas, anti-aircraft bullets and tanks.

Let me take two examples. I have here sections of bullets which stopped the German air raids on this country. There are six of them, from the first crude bullet, indistinguishable from the bullet that the infantrymen fired out of his rifle, up to this one which to the ordinary layman does not differ on casual examination from the first, but that bullet used only once, on Whitsunday of last year, prevented any further air raids on this country.

Were we right to scrap the earlier bullets when we found a better one? Were we not right to stop the contract for the earlier bullet and to pay compensation to the contractors?

I would not have liked to have been the Minister to stand up in this House on one of those nights when London was being raided, and when questioned as to whether we had not a bullet to stop the raids to have said, "Yes, it is true, but the contractor is engaged turning out the earlier form of bullet, and we must not turn them off that in order to make the new bullets, otherwise the Comptroller and Auditor-General, the Public Accounts Committee and the Press will denounce the Department as being wasteful muddlers."

I remember standing in my garden at Blackheath—I think it was on the occasion of the first raid—watching a Zeppelin which was hovering over Woolwich Arsenal and apparently dropping its bombs with complete impunity. Our poor little pom-poms and anti-aircraft guns did not get within miles of their objective; they could not fire more than two miles in those days.

We have now anti-aircraft guns which can fire effectively at objects five miles in the air. I watched that Zeppelin, and I do not think that I ever had a greater sense of humiliation than when I thought that it was possible for Germany to attack the very heart of this Empire to do its best—and it did a great deal—to check the moral of our people, and interfere with production, without our being able effectively to reply.

When the Zeppelin raids were stopped, as they were, by the heroism of our airmen, and the engines of defence which we were able to provide, a new problem presented itself, because the bullet that had been effective against the Zeppelins was not so effective against the heavier-than-air machines, and our men had to go on with their experimentations, trying to devise a bullet which would be equally effective.

As the Committee knows, that bullet was found, and during the later months of the war we had not the dread of air raids. But if you are going to put it on the ground of money alone, and consider the loss of money on these contracts on the one hand, surely you ought to compare it with what would have been the loss if those raids had gone unchecked.

On the day after Whit Sunday last year it was known that Germany had prepared for air raids on this country, by heavier-than-air machines, greater in magnitude than had ever been attempted before. Why did they not come?

They did not come because the reception that their airmen got that Sunday night made it impossible to get men to face such risks

On the mere ground of money alone, if that ground is taken, then on these contracts the Department can claim to have acted justly and properly in the action which it has taken.

Captain WEDGWOOD BENN : During the war I was interested in the Air Force, and I can still remember the real feeling of pleasure and relief it was to me when I visited home during my leave and my right hon. friend the President of the Local Government Board (Dr. Addison) was able to show how the appalling deficiency in the supply of aircraft was being made good by the new programme which the Munitions Board was preparing at that moment. But it does seem to me essential, looking at the Department as one dealing with munitions of war, to realise that it is not in the heaping up of things we have got that we can make any preparation of things whatever for any future conflict in which we might be engaged. That, really, is the answer to the hon. gentleman's tirade against the Free Trade position of this country.

* * *

The following oral answers were given on June 25th :—

ROYAL AIR FORCE.—AIR NAVIGATION.

Capt. WEDGWOOD BENN asked the Under Secretary of State for Air (1) whether any sextant suitable for taking bearings in the air is in use or being experimented with; (2) what liaison exists between the Air Ministry and the Admiralty with a view to applying to air navigation the experience of the Navy; (3) what is the staff of the Air Navigation School; and whether it includes any qualified marine navigators; (4) what progress is being made in instruction in taking bearings in the air.

The UNDER SECRETARY of STATE for AIR (Major-Gen. Seely) : At the moment the whole system of instruction in aerial navigation is being revised, and the schools of aerial navigation re-organised; and in this process we shall certainly keep in close touch with all those whose experience of aerial or marine navigation is likely to be of assistance, and endeavour to perfect, as far as possible, all mechanical aids to navigation, such as sextants. Experiments with various types of sextant are already being carried out with this object

At the present moment there is great hope of the early development of a satisfactory artificial horizon sextant and experiments are now being carried out at the Royal Air Force experimental establishments with a view to its early perfection. I would add that the officers who are dealing with this question will be very glad if my hon. and gallant friend will give them the benefit of his advice and criticism.

Capt. BENN : Is the Air Force taking full advantage of the navigating experience of the Admiralty? That is the point.

Major-Gen. SEELY : Yes, Sir. I think we may say we are working in absolutely close co-operation with them, and many of the officers dealing with this matter have themselves sea experience.

Capt. BENN : Are any of the instructors in the navigation schools naval officers?

Major-Gen. SEELY : Speaking from recollection, many of them are or have been in the Navy. I should like to have a precise question on that point

Capt. BENN : The question is on the Paper.

Lieut.-Comdr. KENWORTHY : Are there any navigating officers among the instructors?

Major-Gen. SEELY : I must have notice as to the precise number of navigating officers. My hon. and gallant friend is aware that many of our Air Force officers guiding us in this matter are naval officers.

Capt. BENN : Are they naval officers or members of the Royal Naval Air Service, which is different?

Major-Gen. SEELY : Both

AERONAUTICS and The LAW

CURIOSITIES OF AIR LEGISLATION—(*Continued.*)

By "THE LINCOLN IMP."

Impenitent Impudence.

Having already brought about one amendment of the 1919 Regulations and hoping to be in time with the rest for the Air Bill, 1920, the Imp feels in good fettle. He offers no apology for his impudence recently in offering to improve upon Regulation-pattern definitions, and has several more improvements to suggest. The *advocatus diaboli* is a most useful member of society, and as much a part of our constitution as "His Majesty's opposition." To proceed, therefore :—

What is an Aerodrome?

"*Aerodrome*" means any definite and limited ground or water area intended to be used and capable of being used either wholly or in part for the landing or departure of aircraft. So say the Regulations.

Will some official please tell us? What is an area which is definite but not limited? Or limited but not definite? The definition excludes ships' decks and the roofs of buildings, although used as aerodromes, and seems to include the whole area of the enclosed camp and hangars of an aerodrome, and not merely the landing surface. The ambiguity leaves a useful loophole for persons infringing the circuit and other regulations. Another ambiguity lurks here in the word "aircraft" in its context. Which is meant—"an" aircraft (singular) or "all" aircraft (plural)? A kite is "an" aircraft, and most tennis lawns are "capable of being used for the landing of kites." But "all" aircraft would include giant airships and seaplanes, as well as Avros, etc., and few aerodromes cater for such a miscellaneous clientèle as this. If aircraft does not mean "any" and does not mean "all" what does it mean? When is an area not an aerodrome because not "capable of being used . . . for the landing . . . of aircraft"?

What, again, do the words "intended to be used" mean? Intended by whom? Suppose that you intentionally land in my field to serve a writ on me and I intentionally acquiesce in your immediate departure by air—*anglicé* turn you out!—my field, it seems, has now become "an aerodrome" to which any minion of Mr. Churchill has right of access!

What an Aerodrome Is.

"*Aerodrome,*" suggests the Imp, means a surface (a) habitually used (b) for the landing or taking off of flying machines, (c) or purposely adapted (d) for such use.

(a) The neutral term "surface" draws no unnecessary distinctions between land and water, and includes decks and roofs as naturally as sea or soil.

(b) "Habitually used" is intentionally elastic; it is sufficiently elastic to enable common sense to be applied to each case as it arises.

(c) "Flying machines" not "aircraft." The attempt to include under one term the landing-grounds of airships, balloons, kites, and flying machines is too difficult, and can only lead to confusion.

(d) "Purposely adapted." This excludes meadows and other open spaces which, however admirably adapted by nature to be used as aerodromes, are not in fact so used by man nor adapted for such use by their owners or others.

Clear as Mud!

"No aircraft shall fly," "Right to land," "To fly aircraft," "To navigate aircraft," "The flight proposed," "Unable to land," "A flying machine when in the air," "To take off," "Alighting aircraft," "Aircraft in the air," "About to land," "When an aeroplane starts," "Aeroplanes flying," "Trick landings," "When taking off or alighting," "Approaching for the purpose of landing," "Landing zone," "Commence to take off," "Night landings," "Shall be elevated," "On land," "Dangerous to flying," "At which he lands," "Arriving or departing by air."

The Regulations regard such phrases as these as too clear to need definition. Let them tell us then who flies—the pilot or the craft? How should one distinguish "to take off" from "to start," "to commence to take off," "to elevate," or "to depart by air"? When is an aircraft which is "compelled to land" "unable to land" although it has "a right to land" at the aerodrome "at which he lands"? How can you tell whether it is "about to land" or only "approaching for the purpose of landing" or merely "arriving by air"? Is a kite balloon which has been elevated an aircraft in the air, and if its pilot has not been licensed to navigate aircraft is it flying in contravention of the regulation "no aircraft shall fly, etc." ?

What Is Flight?

"To fly," "To land," "To take off." Not until the reader has tried his own hand at the game will he realise the difficulties inherent in the attempt to define these simple ideas in clear and suitable language. The Imp has to apologise for the seeming pedantry of the definitions he is about to offer, and can only hope that some reader will quickly displace them by better ones.

"*Flight*" in relation to an aircraft includes motion and rest in the air, but does not include the motion or rest of a flying machine between the acts (a) of coming into contact with and of leaving the surface. "To fly" has a corresponding meaning.

"*In the air.*" An aircraft is in the air when it is off every surface (b).

How to Take Off and Land.

"*Taking off*" in relation to a flying machine (c) includes the act of leaving the surface (a) and the sequence of acts and events (d) immediately preceding and succeeding that act. "To take off" has a corresponding meaning. Aircraft designed to be lighter than air and lifting kites are taken off by the act of freeing them from the restraint which keeps them on or in comparative proximity to the surface (e).

"*Landing*" in relation to a flying machine (c) includes the act of coming into contact with the surface (a) and the sequence of acts and events (d) immediately preceding and succeeding that act. "To land" has a corresponding meaning. Aircraft designed to be lighter than air and lifting kites are landed by the act of subjecting them to a restraint which keeps them on or in comparative proximity to the surface (e).

Nota Bene.

(a) A flying machine which is taking off does not begin to fly until it leaves the surface, but is still taking off after it has begun to fly and may be beginning its landing while it is still flying and continuing it after it has come into contact with the surface, although it has then ceased to be in flight. Is that clear?

(b) This is not superfluous. A scout-craft on an airship is not in flight except as part of the airship. Otherwise an offence is committed if the scout pilot has his licence in his pocket and is on the airship!

(c) Flying machines "take off," other aircraft "are taken off," one speaks of "flying a kite" but not of a kite "taking off."

(d) An "event" is here used in the sense of that which happens or may happen without human intervention and an "act" in the sense of that which happens by human intervention and is intended to happen or is deemed by law to have been intended to happen. Hence it seems that a bad landing resulting in a crash is a landing, but a stall and unintended nose dive into the ground is not, although the stall was intentional; conversely, an unintentional stall converted into an intentional (though compulsory) landing is a landing. Similarly, a "forced" landing is a landing if the pilot lands the machine but not if for any reason the machine lands itself. A bumpy landing is one landing, not several. But to bump in a fog may be no landing at all. At a few feet from the ground a machine will be landing if it goes on and touches, although it takes off again, but if it "lands six feet up" and goes round again it will not have been landing, but only "attempting to land."

Carried away by the exuberance of his own verbosity, the Imp is forgetting to be a devil and to pin-prick the minions of the Minister for Air! To it, Teazer! Go for them, Gadfly!

Regulation Bloomers.

1. If a test pilot may be defined as a pilot who flies aircraft for experimental purposes within the precincts of an aerodrome, then a test pilot needs not a licence. Any fool can test is the argument one supposes! (Sect. 1 (3) and proviso (b)).

2. Aircraft owned by aliens can—nay, must—be registered (it seems) if the applicant is British—though a man of straw not worth a shilling (Sched. I., Regs. 1 and 2).

3. A company which is registered and has its principal place of business in the United Kingdom can own aircraft which ply for hire over England although every one of its shareholders and directors is an alien (Sched. I., Regs. 1 and 2).

4. A navigator who applies for a licence is required (*inter alia*) (a) to have no moral defect (b) not to have more than two (2) dioptres of latent hypermetropia (c) to have a degree of auditory acuity compatible with the efficient performance of his duties and (d) to calculate azimuth. But cheer up, my hearty! Who said you needed a licence to navigate aircraft? The Regulations don't say it, so why apply for one?

5. An airship having voluntarily stopped its engines in a dead calm is "under way," and must be treated by other aircraft as being not under control. An airship being towed by a ship is not under way, and for the purposes of the rules of the air is classed as a free balloon (Sched: vii., Interpretation, Rules (6) and (20)).

6. An aeroplane flying below 6,500 ft. and at 900 yds. distance from the nearest point of a licensed aerodrome must conform to the circuit law. Not so a similar aeroplane which is 500 yards nearer the aerodrome, unless it is (a) about to land or (b) leaving or (c) starting (Rules of the Air 34, 32, and 33).

By way of a final piece of impudence let us conclude with Section 1 of the Air Bill, 1920, as the Imp would have it drawn as at present advised. The italicised words have either already been defined by the Imp or are to be defined in the sequel.

AIR BILL, 1920.

1. Within *the realm* no *aircraft* and whether within or without the realm no *British aircraft*.

(1) Shall *fly*:
- (a) Without being marked in the *prescribed* manner, or
- (b) over any *prohibited area* or
- (c) So as to endanger any person unnecessarily, or

(2) Shall *take* or *be taken off*,
- (a) Having on board otherwise than in pursuance of the prescribed permission:
  - (i.) A *postal packet* or
  - (ii.) Radio-signalling apparatus or
  - (iii.) Photographic apparatus or
  - (iv.) A *trade passenger* or
- (b) Not having on board:
  - (i.) The prescribed persons licensed in the prescribed manner to control that aircraft in the air; and
  - (ii.) Means of displaying and making the prescribed lights and signals; and
  - (iii.) The prescribed *flying papers*; or
- (c) From a *public aerodrome* otherwise than in the prescribed manner and from the prescribed place.

(3) Shall *land* or *be landed*:
- (a) After entering the realm by air without first reporting at an *appointed aerodrome*; or
- (b) At a public aerodrome otherwise than in the prescribed manner and at the prescribed place.

(4) While *in the air* shall eject or let fall any person or article except:
- (a) Ballast; or
- (b) A prescribed signal; or
- (c) An article or a person supported in the prescribed manner.

THE LINCOLN IMP.

THE CODE OF THE AIR.

The Paris correspondent of THE AEROPLANE writes:—

The Code of the Air, created by the Peace Conference, is still in a large measure secret, although certain individual items have leaked out, giving the impression that it has been composed with care and foresight. The British influence is apparent in all that concerns aerial transport or circulation in general, that is to say, in its general provisions it follows closely the air regulations already in force in the British Isles.

It first deals with day and night identification of machines: national colours of each country and green and red lights. All aerobuses must be fitted with wireless, although aircraft having less than a certain passenger-carrying capacity must obtain special permission to carry a wireless installation. The reason for this is not clear, because whatever the number of passengers carried a pilot will always be glad of the wireless to obtain his bearings or to ask help.

Every machine will be registered, and will figure on its national register. This registration will necessitate the observance of certain rules. Machines will be forbidden to carry explosives or persons suffering with contagious diseases, and must abide by the postal and customs regulations to which the practical application of aerial navigation has given new duties.

TRAFFIC CONTROL.

Machines will overtake on the left and cross on the right, but there is no ruling for overtaking when climbing! which is extraordinary, seeing that so many collisional accidents have occurred, starting with the Thomas-Dickson one in Italy.

COMMUNICATION IN THE AIR.

Pilots will have to conform to one method of communication whilst in flight, and the system must be international. Thus there will be a new use for the Morse code.

The medical requirements of the Air Code as formulated by the Peace Treaty in Paris are summarised as follows:—

1. No licence to fly will be accorded without a medical certificate of fitness.

2. Every candidate, before receiving authorisation to fly, either as pilot, officer (navigator?), or mechanic of a public transportation service must present himself, and undergo an examination before a competent medical authority selected by the State or acting under its authority.

3. Such medical examinations for the selection of pilots and navigating personnel must have special regard to the physical and mental aptitude of the applicant.

(a) Absence of all mental trouble, and of any physical or moral defect in so far as same would affect the security of navigation.

(b) The minimum age of pilots and navigating personnel engaged in the transport of passengers and cargo is nineteen years.

(c) GENERAL SURGICAL EXAMINATION.—The aviator must not suffer from any wound, have undergone any operation, nor show any anomaly, congenital or acquired, that would interfere with his duties as an aviator.

(d) GENERAL MEDICAL EXAMINATION.—The aviator must not suffer from any disease or complaint that would render him incompetent to control aircraft. He must possess a heart, lungs, kidneys, and a nervous system capable of resisting the effects of altitude and prolonged flight.

(e) EXAMINATION OF EYES.—The aviator must possess a degree of accurate vision compatible with the necessity of his functions. Pilots and officers of aerial crews must not suffer from latent hypermetrophia to a greater extent than two dioptres; they must possess muscular co-ordination adapted to refraction. The field of vision of each eye and the perception of colours must be normal.

(f) EXAMINATION OF EARS.—The average ear must be normal. The aviator must possess a degree of accuracy of hearing compatible with the duties he will be called upon to perform.

(g) "VESTIBULAIRE" (?) apparatus must be intact and must not be hyperexcitable or hypoexcitable.

(h) EXAMINATION OF NOSE AND THROAT.—The aviator must have complete nasal permeability and be free from any affection, acute or chronic, of the upper respiratory organs.

4. Each country may decide on their own methods of examining applicants, provided that the details and the limits of the tests employed have been previously agreed upon by the authorised representatives of each nation.

5. Applicants having fulfilled the above conditions will receive a certificate permitting them to obtain a licence.

6. To assure that all navigating personnel continue to possess the above qualifications they must undergo a periodical examination at least every six months, and the results of such examination must be recorded in their dossier.

After illness or accident each aviator must undergo a new examination in order that his suitability to continue as a member of the navigating personnel be decided; such decisions being noted on the flying ability log-book.

7. All aviators who, prior to this convention, have given proof of their fitness for flying and who retain same, need not necessarily be excluded from the navigating personnel by reason of the fact that they do not fulfil all the conditions.

8. Any nation may increase the severity of the conditions; the above are the minima.

THE VICTORY LOAN.

The Air Ministry makes the following announcement:—

In order to assist the progress of the Victory Loan it has been decided to allow commercial or private aeroplanes, flying over the British Isles, to drop, subject to the undermentioned condition, small discs of paper, advertising the loan, on the towns or country over which they are passing.

Clause 2 (d) of Regulation 5 of the Air Navigation Regulations, 1919, will not apply to aircraft engaged on this special work provided that any companies or other owners of aircraft willing to undertake the work act on the instructions of the Secretary, National War Savings Committee, Salisbury House, Salisbury Square, E.C.4, from whom all further information can be obtained.

Unless this condition is complied with, action will be taken in accordance with Regulation 10 (1) of the Air Navigation Regulations, 1919.

THE IMPERIAL AIR FLEET.

Lord Morris, ex-Premier of Newfoundland, addressed a meeting at Birmingham on June 30th promoted to stimulate interest in the project of presenting an aeroplane by Birmingham to South Africa.

There was peculiar appropriateness, he said, in Birmingham selecting South Africa for its gift, inasmuch as the late Mr. Joseph Chamberlain was probably more identified with the freedom of and the granting of responsible government to South Africa than anyone else, and the wisdom of Mr. Chamberlain's South African policy had been shown by the way in which not only British-born colonists but the Boers had rallied to the help of the Motherland in the war.

Already £1,700 has been promised towards the £2,200 required.

THE R.A.F. IN RUSSIA.

In May last I was warned to report at the Air Ministry, and everyone said "Overseas!" and the best of luck. On arriving there I reported, together with several other pilots and observers, and was asked various questions, and then told I was to obtain two suits of mufti, a civilian overcoat and cap, and a mosquito net, and report to a certain captain at Blandford. I was in-

structed not to mention the stunt to anyone, as it was a secret mission.

A Secret Mission.

Think of it, a secret mission with suits of mufti and a mosquito net! "Where were we going and what for?"

On arriving at Blandford I found a merry little party of three pilots and four observers who were also on this secret stunt. No one knew where we were going, so we had to wait. Next day we travelled back to town and reported at the Tower, where we were medically examined and given a slip of paper on which was the following:—

You must have two suits of mufti, etc., etc.

You must take supplies of everything for at least six months.

You must have clothing to stand a climate varying from summer on the Riviera to winter in the North of Scotland.

You must mention nothing of this to anyone.

Cameras are permitted.

There was some other advice as to kit we should obtain.

We were given leave and told we should be wired for. Well, on June 14th we entrained on a "North Special" about midnight and found we were going to Newcastle. On this train were infantry, artillery, and all other branches of the service, but no one seemed to know where we were going eventually.

On arrival at Newcastle we embarked on the "City of Marseilles," and left port on June 15th at about 5 p.m., and were escorted out to sea by De H.6's and destroyers.

The Secret Revealed.

After leaving port the secret was revealed—Russia; and then we all wondered what mosquito nets were for, but we soon found out.

We discovered that the total number of R.A.F. was one colonel, four pilots, four observers, one E.O., and about 57 N.C.Os. and men—hardly a flight, but it must be remembered that it was only a small expedition, and at that time things were none too rosy in France.

After an uneventful voyage we arrived at Murmansk, which is a little port that is never frozen up and has been built since the war. Here we commenced to unload the ship and obtained a railway truck on the quay, which was converted into an office.

Soon after landing we started to recruit for the Slavo-British Aviation Corps (S.B.A.C.) and Slavo-British Allied Legion.

Seaplanes Required.

After looking round Murmansk it was decided that an aerodrome could not be built, so a seaplane ship was wired for, as the Kola River is an ideal place for watercraft and the surrounding valleys are full of lakes where a seaplane could alight in case of engine trouble.

Recruits were coming in satisfactorily, so our C.O., Lieut.-Col. Maund, D.S.O., a man who had been in Russia before the Revolution with Col. Valentine, decided to form instructional classes for the S.B.A.C. Each of the R.A.F. officers had a subject, and the time was well spent in instructing the old Russian pilots and mechanics who had joined us.

The chief subjects were Aerial Gunnery, Contact Patrol, etc., etc., and the school was practically a miniature Reading. It must be remembered that our Russian friends had not flown or seen an aerial gun for nearly a year, so their knowledge was a trifle rusty. Also ground strafing and contact patrol were practically unknown in the Russian Flying Corps.

The Interest of Russian Pilots.

The Russian pilots were extremely interested in the Aldis Sight and the C.C. gear, and when we told them of the performances of our latest machines they were amazed, as the last machines they had before the Revolution were Sopwith 1½ strutters, a few Pups (which were liked by all who had flown them), some Nieuports, and Spads. But these machines only carried one gun, and they thought it wonderful when they heard of a Camel with two guns, and an Aldis Sight, Snipes, Bats, Bristol Fighters, etc.

Soon after this the seaplane ship, H.M.S. "Narrana," arrived, and the land R.A.F. or R.F.C. were invited to dinner by the sea R.A.F. or R.N.A.S. I think I am quite right in saying that we all had a very enjoyable evening after having lived on practically Army food for some time.

Mistaken for Devils.

The seaplanes soon got to work, and during the first flight over Murmansk the inhabitants were extremely frightened, as they had never seen an aeroplane before. One woman was crying, and could not be made to understand that the machines would not hurt her. I think she thought they were "devils from hell" (no offence to the seaplane people meant) which the Allies had brought to their aid.

Soon after this the machine-gun class were put through their firing tests, and one R.A.F. observer, complete with aerial Lewis gun, managed to get lost in some marshy ground near the range. After wandering about for an hour or so in the marsh he found us, and seemed very fed up. He was nearly bitten to death by mosquitos, and said things to me he ought not to have said, as I had chosen the range. However, all went well, and we had a very successful afternoon.

Next day we sailed for Archangel, and the Navy, who were in front, had a scrap with Bolshevik and German forces just before entering Archangel. One of our seaplanes that was up spotted

THE R.A.F. IN RUSSIA.—Centre, Lieut. Schviesnikoff, R.A.F (killed). Extreme right, Capt. Kozakoff, R.A.F. The Sopwith "Camel" was one flown by Capt Kozakoff. The Russian pilots are wearing the uniforms of private soldiers, as at that time no officers' uniforms had arrived.

THE PARK OF NO. 1 RUSSIAN SQUADRON.—This Squadron was of Russian Pilots on Sopwith 1½-strutters and Nieuports.

an enemy battery firing at our ships and dropped a 230 lbs. bomb, which caused the gunners to hop it.

On our arrival at Archangel, Backnaritza Wharf, we immediately proceeded to look for an aerodrome, and after a great deal of searching found a small field about 300 yards long by 150 wide, which served the purpose.

In Travelling Quarters.

After landing, we were told to look for a sleeping car for the officers and sleeping cars for the men, also cars we could fit up as messes and trucks for spares, as we had to live in this mobile train. It was sent up to the aerodrome, together with the machines, and when we managed to get the train in order everyone was comfortable and happy.

Work now commenced at the aerodrome—machines were rigged, the aerodrome levelled, hangars erected, and everyone was very busy. Our mess president was a very wise man and bought a considerable quantity of foodstuff from the various ships in harbour, so that we were very happy and had a change from biscuits and bully, etc., although the food supplied was very good

Early in August our first machine was ready. We landed in Archangel about Aug. 4th, and the flight commander, Capt. F. V. Robinson, D.F.C., made the first trial flight. It was good to see an aeroplane in the air again after our long wait. Flying now began in earnest, and as there were two fronts—the River Dwina and the Vologda railway—we were fairly busy.

Forest and Swamps.

What a country to fly in! Miles and miles of forest and swamp, and nowhere to land in case of engine failure.

The line was about 30 miles north of Oberzetskaia, and we had to fly 70 miles before reaching the enemy. On our first trip down, the Bolsheviks had one Archie (anti-aircraft gun) which was a huge joke, as the gunners' one idea seemed to be to put up shots round themselves so that we should not drop bombs on them.

The seaplane ship now went back to Murmansk and we carried on at Archangel.

The seaplanes (Faireys) used to do the bombing and reconnaissances before we were ready, and although they had to fly 70 to 80 miles down the railway line before reaching the lines, they had reliable engines—Eagle VIII., Rolls—and there was absolutely *no place whatever* to land during the whole of the trip. Of course there were hundreds of lakes where a seaplane might have made a forced landing, but there was no place for a De H.6, let alone a De H.4, to land.

About this time the Russian Squadron got going on Sopwith 1½ strutters, and two Nieuports which were found in Archangel, having been sent there by the Allies before the Revolution, and most of them were still in perfect condition. This squadron went up the river and established an aerodrome at Siskoe. This squadron (called a squadron, but not a squadron in strength as we know it) was composed of ex-Russian officers and men of the old Russian Flying Corps, and did very good work indeed. There was also a pilot from the "Narrana" with them, and he was flying Sopwith-Schneider machines.

From this time we practically confined ourselves to the railway force near Oberzetskaia, and did reconnaissance, bombing, ground strafing, contact patrol, art. obs., photography—in fact, everything except night flying.

Some Useful Work.

During the month of August we dropped many tons of bombs, and did a considerable amount of photography and reconnaissance, and on one occasion one bomb dropped from 150 ft. in Oberzetskaia station caused over 70 casualties.

Early in September the infantry decided to push for Oberzetskaia, so we started intensive bombing and ground strafing, and the enemy were pushed back to within about four miles of Oberzetskaia. Progress in the infantry was very slow, as when the enemy retired he blew up all the bridges, which had to be repaired before our armoured train (not the R.A.F. train) could proceed.

About this time the enemy received reinforcements in the shape of six anti-aircraft guns and some German gunners who knew

THE R.A.F. IN RUSSIA.—A Crash. This picture gives some idea of the conditions in Northern Russia.

A Bolshevik Flying-boat (Salmson Engine) which Landed in the British Lines.

now to shoot, so that Archie got very hot. Just before taking Oberzetskaia the Bolsheviks had 11 anti-aircraft guns in one small siding, and as the gunners could shoot we always had some bits of fabric or wood missing on our return home.

About Sept. 2nd the infantry made the final push for Oberzetskaia, so we went down in formation of three machines. Up to that time we had been down singly, so there was much surprise when three machines rolled up. On this occasion we each carried five bombs—two 112 lbs., two 40 lbs., and one 20 lbs. Cooper—which the observer deposited over the side.

Frightening the Bolsheviks.

After dropping our eggs we all went down low to ground strafe, and the Bolsheviks were so frightened that the infantry took Oberzetskaia without much struggle, and I think I am right when I say without a casualty.

This was attributed to the material and moral effect of the bombs and machine-gun fire from the machines overhead. We found later that the enemy had some very strong defences round Obersetskaia, but was in a terrible state of nerves owing to the presence of aircraft overhead.

After capturing Oberzetskaia we found a spot that would be suitable for an aerodrome. It was just a widening in the Oberzetskaia-Onega road, and when we had cut some of the trees down and levelled it off a bit, it measured about 50 yards by 250 yards, with trees all round, so was a very small place for De H.4s.

The R.A.F. train now moved down here, and we erected hangars and commenced work from this aerodrome. This was a relief, as the line had now moved and was about 15 to 20 miles away, so that instead of 150-mile trips to the line and the same distance back again, we only had short trips, for which we were very thankful. I forgot to say that the seaplane ship came back to Archangel just before we moved down the line, and as our mess was in order we gave them a return dinner, which was very enjoyable.

A Bolshevik Seaplane.

Also whilst at Archangel a Bolshevik seaplane came over, but as two of our machines were up at the time of his visit he wisely decided to come down and surrender.

From Oberzetskaia aerodrome we commenced to bomb Emtza, about 40 miles away, and one flight was made to Plezetskaia—60 miles over—for photographic purposes. Here we discovered a Bolshevik aerodrome, but his machines, Sopwith 1½ strutters and Nieuports (Allied machines that had been sent to Russia before the Revolution), were not of much account, as they would never fight or come up when we were over.

One Sopwith came over and dropped two bombs miles wide of the mark and then crashed between the lines, and was afterwards salved by us. Another machine (enemy) was seen up in the air by one of our machines, but before a scrap could take place the Bolshevik machine caught fire in the air and crashed in flames in the forest.

Not Inclined to Fight.

I believe a Bolshevik Spad was seen on the river front near Siskoe, but it would not fight.

On one bombing raid of ours one of our pilots hit an enemy anti-aircraft gun mounted on their armoured train, and from a prisoner's statement killed six gunners.

An Aerial Photograph of Oberzetskaia taken during the Bolshevik Occupation.—This shows Bolshevik Trains, Bomb Craters and surrounding Forest. The white Rows are Timber for Engine Fuel (Railway Engines). The Two Round Towers to the North of the Station are Water Towers about 60 feet high. This Photograph was taken on August 18th, 1918.

In October some reinforcements came out with R.E.8s, and Lieut.-Col. Maund, D.S.O., went home. The new C.O. was Lieut.-Col. Van der Spuy, M.C.

Whilst we were at Oberzetskaia the infantry tried to capture the enemy armoured train, and the R.A.F. was asked to cut the railway line behind the train to prevent its escape. This was done, the line being cut with a 112 lb. bomb; but unfortunately the armoured train was not captured.

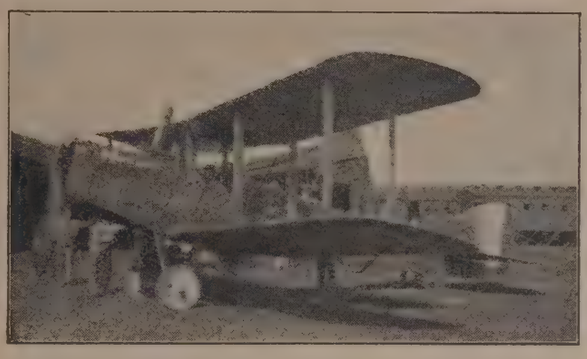
A Successful Expedition.

Another trip was made by one of our machines to the River Onega. The infantry reported a large Bolshevik boat coming up the river and asked for an aeroplane to spot it and try to destroy it, so our machine went over and dropped two 112 lb. bombs, which we claimed were within 25 to 50 yards from the boat. The boat was not seen again, but we heard later that it had to be beached and then towed back, as the bombs blew its side in. That was the end of the Bolshevik boat.

Soon after this we were relieved by the reinforcements and went back to Archangel for a rest. The observers applied to go home to learn to fly, and we heard that leave was being granted, so we all got home on the same boat, and the powers that be at the Air Ministry said we need not go back to Russia unless we wished, so we have not gone back.

A Forced Landing.

I have just remembered several more incidents and hope they will be interesting.



One of the machines was returning from a raid and was just north of Tundras (30 miles south of Archangel) when the engine conked, and the pilot decided to come down on a swamp to the east of the line. This was accomplished very successfully, and although the machine was damaged, both pilot and observer were unhurt. (Of course, if one's engine conks in Russia, one has either to try to land on the railway line—a single track and broader gauge than British railways—or land in the forest or swamp. In each case it means a crash, and the thing is to let oneself and the machine down as lightly as possible.)

After a Crash.

On all our trips over the lines we carried two days' rations and a pocket compass, besides military load, so when this machine crashed the pilot and observer commenced to walk westward by the compass, as they knew the railway line was to the west of them. After scrambling through thick forest and marshy ground, often knee deep in slime, for over an hour they eventually hit the railway line and saw a small hut some distance away. Here they found a Russian signalman, and tried to explain that they wanted to telephone to Archangel. After much arguing, etc., they got through to Headquarters in Archangel and said they were unhurt. Later on they caught a train to Archangel, very wet, tired, and fed up.

Next day a party went out with them to salve the machine, but after searching for hours in the thick forest they could not find it, so returned home.

After this we sent another machine up to try to locate the crashed one, and this soon spotted it, took bearings, and came home to report. The crash was about five miles from the railway line and on the edge of a swamp, so another party went down together with about 30 Russian labourers, and after struggling through the swamp and forest again, found the machine.

THE R.A.F. IN RUSSIA.—An R.A.F. D.H.4 Starting on a Bombing Expedition.

Now came a very hard task—getting a De H.4 machine through five miles of thick forest and swamp. All detachable things—planes, rudder, undercarriage, etc., etc.—were taken off and sent back to the railway line, and some of the Russians were told off to cut a road through the forest to enable the fuselage to be dragged to the line.

Other Russians began to make a sleigh to support the fuselage so that it could be pulled along. Work went on all night, and eventually the road was ready and the machine (fuselage) dragged by about 50 Russians to the railway line, where it was loaded on a truck and sent to Archangel.

Hard Work and Mosquitoes.

The time taken to make the sleigh, cut a road (the road was formed of trunks of trees cut down), and drag the machine the five miles was about five days. This was in the summer, and the mosquitoes were terrible, and as the poor pilot and observer were out superintending this work the whole of the time, we all decided that we would come down near the railway if any more engines conked.

It may be said that the machine was not worth all this trouble, but we only had eight out there and could not afford to lose any.

The Bolshevik seaplane that landed in our lines was overhauled and flown by a Russian pilot, who used to take the General (Brigadier-Gen. Finlayson) down the river to the river force. This journey by boat occupied from two to three days, but by aeroplane it was performed in about three hours, and the General and other people used always to fly down and back again

Officers of the Original R.A.F. Detachment in Russia.

—in fact, the machine was practically called the General's machine.

The only trouble with it was that there were no Salmson spares in the country, so that when the Bolshevik pilot landed on our aerodrome on a Maurice Farman with an engine of the same type, we were in luck's way, as this gave us a spare engine for the flying boat, although I don't remember the original Salmson in the boat ever breaking down.

The Result of Engine Failure.

Another incident worth relating took place when we were stationed at the Oberzetskaia aerodrome.

One of our machines—De H.4—went for a reconnaissance over Kodish, and while over the enemy's lines the engine conked (oh, these R.A.Fs. !). Running through Kodish is a wide road (the roads in Russia are just tracks covered with tree trunks), so the pilot headed for our lines (our force was on the road north of Kodish) and just managed to cross over the Bolshevik front line about 300 ft. up. He managed to get back into our lines and tried to land on this road, but where he touched the ground the trees narrowed and his wings caught in the tree trunks, thus stopping the machine, which was, however, very slightly damaged.

After getting out of the machine and walking up the road, the pilot and observer met the doctor, who was accompanied by stretcher bearers and stretcher. The doctor had seen the machine coming down and had hastened down the road to render any assistance that might be necessary. On arriving at the headquarters of our force the pilot phoned to R.A.F. Headquarters at Archangel to say he and his observer were uninjured. We at Oberzetskaia were much concerned about his non-return, and it was not till next morning that we heard he was safe.

The distance from Kodish to Archangel by road and river was a good 200 miles, so did not send help that way.

A road from Oberzetskaia ran to Tegra and joined the Kodish road there—distance about 80 miles—so we formed a party of mechanics, about eight, and started them off along this road, Oberzka to Tegra, to salve the machine. They were given one week's rations, and took a Lewis gun and two carts with Russian drivers. Owing to the state of the roads and slow travelling it was calculated that it would take the relief party at least three days to reach the crash, so the pilot went to Archangel *via* road and river and left the observer to look after the machine till the arrival of the relief party.

The observer managed to obtain a small Russian cart and a pony, so he took off the planes and packed up the fuselage on this cart, which commenced to creak and groan under the weight. However, progress was made, very slowly though, the Russian driver managing his cart very well.

An Unwelcome Visitor.

The relief party made good progress, but one evening, as they were preparing to camp for the night, a huge bear dashed out of the forest and went across the road, but was gone before the Lewis gun could be brought into action. This rather livened things up, and the next day the relief party arrived in Tegra, and was proceeding along the Kodish road when they met our friend the observer, with about three days' growth of beard and moustache, riding on a fiery steed (otherwise a Russian pony), and in the distance was the machine on its new undercarriage, the cart.

Things were now re-arranged, the other two carts taking a share of the weight, and the procession moved on to the river at Siskoe. Here provisions ran low, and our observer managed to wangle some more and also a blanket for himself. The poor fellow had been without one since landing (crashing). It might be mentioned that we sent some of the observer's personal kit (razor, toothbrush, etc.), also a bottle of whisky, with the relief party.

It was a good thing we sent the whisky, as our observer made friends with a Russian skipper, and owing to the good effect of the spirit managed to get a boat (boats were none too plentiful at that time), on which the machine was loaded and the journey up river made to Archangel, where the machine was handed over to stores.

J. I. Starbuck.

LONDON AND ITS AERIAL FUTURE.

Lord Montagu of Beaulieu presided at a dinner of the London Society at the Royal Adelaide Gallery, Strand, on June 26th, when Mr. G. Holt-Thomas read a paper on "London and its Future Aerial Transport."

The Chairman said that he took a great deal of interest in aviation in London, because so far as he read the Transport Bill now before Parliament, aviation was the only thing that was left out of it, and the only thing that would not be controlled. London must be the centre for the meteorological research of Western Europe. Meteorology and navigation were the two most important things to study in aviation to-day.

Geographically speaking, the position of London in regard to Western Europe was the most important. We were the nearest of all the big capitals to the Atlantic, and our meteorologists were, owing to the difficulties of foreseeing the variations in our changeable climate, possibly as good as, if not better than, any in the world. London must naturally become, in his opinion, the centre of meteorology in Western Europe.

Covered-in Parks.

London was the biggest capital in the world and he thought they needed above everything in winter open spaces which were not subject to the disadvantages of wintry weather. He was going to throw out an idea which might seem somewhat fantastic, but which, he thought, many of them would live to see. He thought they would live to see some of their parks roofed in. They would live to see a park like St. James's Park or the Green Park covered with a great glass roof, which would be the central landing stage of London. There would be the aeroplanes landing on the roof, light and sunshine pouring through the glass, the sides open, and the wind blowing through and underneath, so to speak, an open winter garden.

They would land all their aeroplanes, say, right in the middle of Hyde Park or St. James's Park, and right underneath the masses would be taking their pleasure. He only threw that out as an idea, but he believed that it would come, and that a landing stage in the middle of London would be practicable.

Mr. Holt Thomas, at the outset, confessed that he could not imagine, enthusiast as he was, that internal flying in London was going to render any great service; that was to say, he could not see aeroplanes conveying mails from the General Post Office in the City to the Post Offices of the West End, although it was impossible to prophesy safely as regarded flying in view of the enormous progress recently made.

In an incidental reference to the air raids on London, he urged the need of a sufficiently large Air Force being kept in existence to repel possible future attacks by air. He had no doubt that all who had read the newspapers that evening thought that a League of Nations, though very desirable, was rather doubtful, and that if we were left without an Air Force we should be in a very precarious position.

As to the general question of aerial transport, Mr. Holt Thomas alluded to the recent long-distance flights, observing that the occupants of the machine which crossed the Atlantic took considerably longer to travel by ordinary means from Dublin to London than it took them to cross this enormous space.

One could get to Paris to-day quite easily and comparatively comfortably by train and boat, but nothing but the aeroplane would carry either passengers or letters in 2½ hours, and he saw aircraft competing much more with cables, for instance, than the train. He would go so far as to say that if he started an aeroplane, say, every two hours from London to Paris, and vice versa, no more telegrams would be sent, as they could convey words far more cheaply than any cable or telegraphic system and much faster.

£120 a Journey to Paris.

It cost 2d. per word to send a telegram from London to Paris. Assuming that it cost £120 to fly from London to Paris, and taking one of his own machines, which was to-day used on the military service between London and Paris, they could carry (he was quoting General Sykes) 672 lbs. of matter. Assuming such a low weight as 2,000 words per ounce—he thought it could safely be put at 5,000—the number of words carried would be 21,500,000, which worked out at so low a figure that one could hardly talk about the price per word. As the calculation would show, they could carry words at 700 a penny.

The same calculation showed one—and this was a subject which they had been specially studying—how the telegraphic and telephonic communication of this country could be linked up with the telegraphic and telephonic services of another country. There was another reason for talking chiefly of mail and matter, as compared with passengers—viz., the expense. Suppose it cost 10s. a mile, or £120, to fly to Paris, carrying two passengers. The price of £60 was almost prohibitive. But consider the weight, say, of two 11 stone passengers as made up of half-ounce letters, and the situation was completely changed. The two 11 stone passengers equalled 9,856 letters, and at the same price per trip, the transport of the letters cost about 3d. each. The charge would, of course, have to be much higher because one would not get 10,000 letters to deliver. Also a special form of collection and delivery would have to be arranged for, as it was no use flying from London to Paris in two hours and taking four more to deliver letters to their destination. Every one must recognise that speed must be paid for.

With regard to the possibilities of stereoscopic photography in charting unsurveyed country, Mr. Holt Thomas said that a single aeroplane had in one flight completely covered with photographs an area of 40 square miles. The cameras used for this work were quite automatic and, once started would go on taking photographs of whatever was under them, without any attention until the films were used up.

NAVAL & MILITARY AERONAUTICS

FROM THE "LONDON GAZETTE."

AIR MINISTRY, June 24th.

R.A.F.—FLYING BRANCH.—Capt. W. St. J. Scott-Scott to be Capt., from (S.O.), April 10th.

Admiralty, June 27th.

The King has been pleased to give orders for the following promotion in and appointments to the Most Excellent Order of the British Empire, in recognition of the services of the following officers during the war :—

O.B.E. (Military Division).

Lt. (actg. Lt.-Cmdr.) G. E. Mills, R.N.V.R.—For valuable services as 2nd in Command, R.N.V.R., Anti-Aircraft Corps.

Lt.-Cmdr. G. E. Nathan, R.N.V.R.—For valuable services whilst attached to the Anti-Aircraft Branch at General Headquarters, Great Britain.

Lt. H. J. Wagg, R.N.V.R.—For valuable services as 2nd in Command of the Anti-Aircraft Telephone Staff at General Headquarters, Great Britain.

War Office, June 27th.

The King has been pleased to approve of the following award of the Distinguished Service Order to the following Officers in recognition of their gallantry and devotion to duty in the Field :—

Capt. G. A. Hill, M.C. (4th Bn. Manch. R., and R.F.C.) (N. Russia).—He has since early December, 1917, been constantly working between the north of Russia and Rumania and Southern Russia. He has attended Bolshevik meetings at night when street fighting was at its height, passing back and forth through the Bolshevist fighting lines, and has been almost daily under fire without protection. He has conducted himself with courage and coolness and rendered valuable service.

Lt. H. O. Loug (No. 3 Sqdn., R.F.C., now R.A.F.).—For most conspicuous gallantry and ability during June and July, 1916. He initiated low-flying attacks on troops, transport, and trains far beyond the enemy lines. He also brought down several enemy aeroplanes. These flights were carried out alone and unescorted. He did splendid work.

Air Ministry June 27th.

MARRIAGES.

EVANS—AYLING.—On June 25th, Capt. Donald Singleton Evans, R.A.F., son of Mr. and Mrs. W. H. Evans, of Buntingford, Herts., was married to Gladys Katie, daughter of the late Mr. and Mrs. Thomas Ayling, of Southsea, Hants.

TAYLOR—NAYCE.—The engagement is announced between Lieut. W. E. Taylor, R.A.F., second son of Mrs. M. Taylor, of Wondau Road, Wigram, and Millicent, eldest daughter of Mr. and Mrs. H. F. Nayce, The Sycamores, Andover.

TYSOE—FERNYHOUGH.—On June 24th, at Christ Church, Lancaster Gate, W., Donald F. Tysoe, R.A.F., was married to Ethel Milne Fernyhough.

BIRTH.

MILES.—On June 23rd, at Dalkey, co. Dublin, the wife of Lieut. J. L. Miles, R.A.F., of a son.

* * *

It is reported that the two British aviators who were forced to make a landing at Astrakhan and were made prisoners are Lieut. Ingram, R.A.F., and Lieut. Mantle, R.A.F.

THE PEACE TERMS.

The following is the full text of the Aerial and Aerial Navigation Clauses of the Peace Treaty :—

PART V.—MILITARY, NAVAL, AND AERIAL CLAUSES.

In order to render possible the initiation of a general limitation of the armaments of all nations, Germany undertakes strictly to observe the military, naval, and air clauses which follow.

SECTION III.—AIR CLAUSES.

ARTICLE 198.

The armed forces of Germany must not include any military or naval air forces.

Germany may, during a period not extending beyond October 1st, 1919, maintain a maximum number of one hundred seaplanes or flying boats, which shall be exclusively employed in searching for submarine mines, shall be furnished with the necessary equipment for this purpose, and shall in no case carry arms, munitions, or bombs of any nature whatever.

In addition to the engines installed in the seaplanes or flying boats above mentioned, one spare engine may be provided for each engine of each of these craft.

No dirigible shall be kept.

ARTICLE 199.

Within two months from the coming into force of the present Treaty the personnel of the air forces on the rolls of the German land and sea forces shall be demobilised. Up to October 1st, 1919, however, Germany may keep and maintain a total number of one thousand men, including officers, for the whole of the cadres and personnel, flying and non-flying, of all formations and establishments.

ARTICLE 200.

Until the complete evacuation of German territory by the Allied and Associated troops, the aircraft of the Allied and Associated Powers shall enjoy in Germany freedom of passage through the air, freedom of transit and of landing.

ARTICLE 201.

During the six months following the coming into force of the present Treaty, the manufacture and importation of aircraft, parts of aircraft, engines for aircraft, and parts of engines for aircraft, shall be forbidden in all German territory.

ARTICLE 202.

On the coming into force of the present Treaty, all military and naval aeronautical material, except the machines mentioned in the second and third paragraphs of Article 198, must be delivered to the Governments of the Principal Allied and Associated Powers.

Delivery must be effected at such places as the said Governments may select, and must be completed within three months.

In particular, this material will include all items under the following heads which are or have been in use or were designed for warlike purposes :—

Complete aeroplanes and seaplanes, as well as those being manufactured, repaired or assembled.

Dirigibles able to take the air, being manufactured, repaired or assembled.

Plant for the manufacture of hydrogen.

Dirigible sheds and shelters of every kind for aircraft.

Pending their delivery, dirigibles will, at the expense of Germany, be maintained inflated with hydrogen; the plant for the manufacture of hydrogen, as well as the sheds for dirigibles, may, at the discretion of the said Powers, be left to Germany until the time when the dirigibles are handed over.

Engines for aircraft.

Nacelles and fuselages.

Armament (guns, machine guns, light machine guns, bomb-dropping apparatus, torpedo-dropping apparatus, synchronisation apparatus, aiming apparatus).

Munitions (cartridges, shells, bombs loaded or unloaded, stocks of explosives or of material for their manufacture).

Instruments for use on aircraft.

Wireless apparatus and photographic or cinematograph apparatus for use on aircraft.

Component parts of any of the items under the preceding heads.

The material referred to above shall not be removed without special permission from the said Government.

PART XI.—AERIAL NAVIGATION.

ARTICLE 313.

The aircraft of the Allied and Associated Powers shall have full liberty of passage and landing over and in the territory and territorial waters of Germany, and shall enjoy the same privileges as German aircraft, particularly in case of distress by land or sea.

ARTICLE 314.

The aircraft of the Allied and Associated Powers shall, while in transit to any foreign country whatever, enjoy the right of flying over the territory and territorial waters

of Germany without landing, subject always to any regulations which may be made by Germany, and which shall be applicable equally to the aircraft of Germany and to those of the Allied and Associated countries.

ARTICLE 315.

All aerodromes in Germany open to national public traffic shall be open for the aircraft of the Allied and Associated Powers, and in any such aerodrome such aircraft shall be treated on a footing of equality with German aircraft as regards charges of every description, including charges for landing and accommodation.

ARTICLE 316.

Subject to the present provisions, the rights of passage, transit and landing, provided for in Articles 313, 314, and 315, are subject to the observance of such regulations as Germany may consider it necessary to enact, but such regulations shall be applied without distinction to German aircraft and to those of the Allied and Associated countries.

ARTICLE 317.

Certificates of nationality, airworthiness, or competency, and licences, issued or recognised as valid by any of the Allied or Associated Powers, shall be recognised in Germany as valid and as equivalent to the certificates and licences issued by Germany.

ARTICLE 318.

As regards internal commercial air traffic, the aircraft of the Allied and Associated Powers shall enjoy in Germany most favoured nation treatment.

ARTICLE 319.

Germany undertakes to enforce the necessary measures to ensure that all German aircraft flying over her territory shall comply with the Rules as to lights and signals, Rules of the Air and Rules for Air Traffic on and in the neighbourhood of aerodromes, which have been laid down in the Convention relative to Aerial Navigation concluded between the Allied and Associated Powers.

ARTICLE 320.

The obligations imposed by the preceding provisions shall remain in force until January 1st, 1923, unless before that date Germany shall have been admitted into the League of Nations or shall have been authorised, by consent of the Allied and Associated Powers, to adhere to the Convention relative to Aerial Navigation concluded between those Powers.

THE ROYAL NAVAL, MILITARY, AND AIR FORCE TOURNAMENT.

The Royal Naval and Military Tournament of former years is revived this year, and owing to the progress of aviation, is known as the Royal Naval, Military, and Air Force Tournament. It is open at Olympia every afternoon and evening from June 26th to July 12th.

The Army are the people who can and do perform most of the events, for they are in their element on the ground, and for their biggest shows, so far as scenery goes, only require a certain amount of wood and coloured canvas, with the addition of a "jazz orchestra" performing on old tins and pieces of corrugated iron.

The Navy are not so lucky, for they cannot bring their ships with them, but they can bring their guns, and make a noise, and with the Marines, can drill and show how they make raids on enemy coasts and such small wars.

THE R.A.F.'S PART.

Something more than drilling and groundwork is expected of the R.A.F., but they are more handicapped still, for to attempt to fly in Olympia would be very bad for the illuminations thereof, and also probably for the machine, not to mention the pilot.

The only possible interesting thing to do is to assemble and dissemble a machine, and that is what is done this year, although a little story is woven round it in the programme, viz. :—

ROYAL AIR FORCE.

AFTERNOON DISPLAY.—An Aeroplane is proceeding by road; orders are received for the machine to reconnoitre.

For this display a machine is brought into the arena packed on a float. The machine is erected and prepared for flight. Immediately it is ready for flight an orderly arrives with fresh instructions that the machine is to proceed at once by road to another aerodrome.—[Truly artistic verisimilitude.—Ed]. These instructions are carried out by dismantling and packing the machine ready to move off to its new destination.

EVENING DISPLAY.—The arena is in darkness; a hostile machine is located crashed near a French village. The workshop lorry and transport lorry arrive and dismantle the machine. Ambulance party also arrives to attend to the injured pilot.

In this display the salvage party are working under light provided by the workshop lorry; and, having dismantled the machine, it is loaded on to the transport lorry ready for departure.

THE 2.30 P.M. R.A.F. SHOW.

In the Afternoon Display, two heavy lorries lumber into the arena, each complete with a Sopwith "pup" fuselage with detached wings. One "pup" is painted white, and the other a brown and white check. In each case a serjeant assisted by four men and two W.R.A.Fs. proceed to wheel the machine off the lorry and then attach the wings with tremendous speed, and succeed in making the machine look like a Camel, as the struts are not lengthy enough to give any dihedral to the top plane.

Whilst the wings are being attached, the pilot, knowing he will not have to fly the machine, or to illustrate the usual carelessness shown by most pilots, gets aboard in complete flying kit without inspecting the machine.

The engine is then run up and successfully fires on about three cylinders, the pilot taking great care not to accelerate it above 500 r.p.m., apparently in case the wings should be blown off.

The machine is then dissembled, although not in the quickest way, which would be to attempt to fly it, but in the orthodox fashion by serjeant and mechanics (male and female).

It is then pushed back into the lorry and away they go.

THE 8 P.M. R.A.F. SHOW AND THE REST.

The evening performance is more thrilling owing to the darkness, and is also more realistic, perhaps owing to the darkness; besides an injured pilot, although a Hun for the purpose of the story, must appeal to those people who go to aerodromes, not to see the flying—but in order that they may not miss a crash in case one occurs.

The attempt is a good one, but displays many weak points, which would hardly be noticed by the general public, to whom the sight of an aeroplane at close quarters on the ground still gives a thrill; also if the engine is run up and they see the wheels go round they expect it to take off immediately.

The rest of the Tournament is quite usual, numbers of horses, gorgeous displays of uniform and much noise, and one pays to see exactly what one does see. The tanks are an innovation and cause much interest. The "Attack" is the grand finale, explosions all over the trenches, clouds of smoke, tanks and infantry firing in all directions; in fact, so much noise, that there might almost be a war on.—G. L. D.

RESULTS.

Among the competitions held during the afternoon of June 26th was a series of tugs-of-war between Navy, Army, and Air Force teams, resulted as follows :—

Railway Construction Troops, R.E., beat No. 2 (N) A.R.D., R.A.F.

Headquarters, E.R.S., R.A.F., beat R.N. Barracks, Chatham.

3rd Group, R.A.F., beat team from British troops in France.

No. 1 S, A.R.D., R.A.F., beat 3rd West Yorks Regiment.

On June 27th, in the tug-of-war, No. 1 (S) A.R.D., R.A.F., was scratched.

On June 28th, the following in the tug-of-war (110 stone) 3rd Batt. Leinster Regt. beat 3rd Group R.A.F. by two pulls to nil.

On June 30th the 1st Irish Guards beat No. 1 Co. A.R.D. R.A.F., by two pulls to nil in the Tug-of-War.

THE CANADIAN AIR BOARD

A Canadian Air Board has been appointed to control all civil and commercial flying in the Dominion.

Mr. A. L. Sifton, Minister of Customs, is Chairman, and General Mewburn, Minister of Militia, and Mr. C. C. Ballantyne, Minister for Naval Affairs, are members. Lieut.-Colonel Biggar is Vice-Chairman. Dr. Coulter, Deputy Postmaster-General is a member of the Board, which seems to indicate the possibilities of a Canadian aerial mail in the near future.

ZEPPELINS AGAIN.

It is rumoured that a Zeppelin airship has been shot down by Esthonian troops. Documents found upon the bodies of the crew are stated to have proved that soldiers of the German "Iron Division" are fighting with the Landswehr.

THE BROCK BULLET.

Among the claims before the War Inventions Commission on June 30th, was that of the widow of the late Commander Brock, R.N.A.S., for compensation in respect of the bullet invented by her husband. This bullet as is well known, was instrumental in the destruction of the majority of enemy airships brought down in England.

AIR RAIDS ON LONDON.

On June 27th, Colonel H. de Watteville delivered a lecture on "London Air Raids" at the annual meeting of the London Topographical Society, held in the rooms of the Society of Antiquaries at Burlington House. The Earl of Kerry was in the chair.

Colonel de Watteville said there was no doubt that long before the war the Germans had made up their minds that the new air-arm was to be a decisive factor in it. The airship was being developed as a counterblast to sea supremacy, but the technical difficulties at the outset of the war had not been overcome to the extent which enthusiasts had desired.

The German Army had then a greater number of Zeppelins than had the German Navy, but five of them came to grief in the early weeks, and the naval airships were then brought forth. During the war some 120 great airships had been constructed by the Germans, but out of that total there were never more than twelve or sixteen ready to take the air at one time.

Dealing with the German naval airships, he said that wireless telegraphy played a considerable part in their navigation. There were some officers in London who knew half an hour before the airships left their sheds in Germany that a raid was to be made on these shores.

The lecturer described the failure of the German military airships based on Belgium, but remarked that the German naval air service was of stiffer metal. Larger airships which would rise to higher altitudes were constructed, and attacks were made on England and on London.

They were, however, met with more effective defensive methods, and the bringing down of the Zeppelin at Cuffley by Capt. Leefe Robinson proved to be the moral turning-point of the air attacks on London by airships. It was witnessed by ten other raiders, and the sight of the burning airship dropping to earth was too much for them.

With the bringing down at Potter's Bar of Commander Matthi, who was a marvellously clever navigator, the sting was taken out of the attack on London.

Colonel de Watteville repudiated the suggestion that the amount of damage done in these raids was suppressed. "Our communiqués of the damage done by the airship raids were absolutely correct," he said. "Every single casualty and every single bit of damage that was done by a German raider throughout the war was recorded."

Some of the airship commanders boasted when they returned to Germany of their exploits in "bombing London," when, in fact, they had never reached it. One, by name Buttlar, had lectured in Germany about his fine attacks on London, and also had written a book. His airship had never been nearer it than forty miles.

Colonel de Watteville also described the aeroplane raids on London from their bases in Belgium. It was still a mystery to him why the Germans did not collect their best pilots to raid it, after some of the demoralisation produced in the east of London in 1917. But both airships and aeropalnes had been defeated. Illustrations were shown on the screen giving the courses taken by aircraft in raiding London. In one case Colonel de Watteville said two enemy airships, entering the country at different points, almost came into collision near London.

R.A.F. OFFICERS CHARGED.

A verdict of guilty was returned by the jury at Middlesex Sessions on June 24th in the case of the two R.A.F. officers, Lieut. Charles Hankey and Lieut. Charles Joseph Young, who were charged with selling property belonging to the Government. William John Twigg and Thomas Oswin, motor engineers, of Hampton, were found guilty of receiving the property.

It was alleged that when left to superintend the transfer of certain stores from Hurst Park to other depots, Lieut. Hankey sold a pair of lorry wheels and magneto parts to Oswin for £20, and 10 barrels of lubricating oil for £40 to Twigg, and also other accessories to Twigg for £15.

Lieut. Hankey, who gave evidence, said that he honestly believed he had a right to sell the goods, and it was his intention to hand over the money he received to the Air Ministry, but he was arrested before he could do this.

In the case of the two officers, Mr. Sharpe said it was a most painful sentence that he had to pass. Both the accused were in positions of trust. He ordered Lieut. Hankey, who was the superior officer at Hurst Park, to prison for 12 months, and Lieut. Young to prison for nine months, both in the second division. It was stated that both officers would, as a result of the conviction, lose a considerable gratuity each.

ONE RESULT OF PEACE.

During the night of Saturday, June 28th, the searchlight station on the summit of Parliament Hill, Highgate, was destroyed by fire caused by a bonfire celebrating the announcement of the signing of the Peace Treaty being lighted too near the wooden fencing. Four fire engines were promptly on the scene, but the following morning the place was a complete wreck.

MORE GRIEVANCES OF CADETS.

Sir,—I have read for the last few months, with great interest, your "Cadets' Grievances," and see no reason why my case shouldn't be brought to light.

I was personally introduced to Major —— at the "Cecil" early in 1917, and, as a result, was accepted for service as a cadet in the R.F.C.

I received my papers calling me up for August, 1917, ordering me to proceed to Farnborough. I was there about a fortnight and was then sent with the first batch of cadets that were sent to No. 1 Wing at St. Leonards. Eventually, I was sent to the "Cecil" for my medical examination, and was passed as an observer. A fortnight later, together with the others, who were passed as observers, I was sent to No. 5 Wing at Wendover, and we were told that we had been sent there to wait until we were 19. A month later the whole Wing was removed to Hastings, and there all the observers were kept until February, 1918, when we were sent for another "Air Board," this time at Hampstead. With several others I was passed as a pilot, and after another month was sent to the S. of M.A. at Oxford.

You will see that instead of a six weeks' course at Hastings, I had six months'.

I arrived at Oxford to see the last lot of cadets given their commissions. After passing the examination there, I was sent to the School of Armament at Uxbridge, and under the new Air Force arrangement, after passing the examination there, I was made a Flight Cadet "A," and posted to an aerodrome.

For an instructor I was given an "old woman"—one always nervous about getting his pupils off solo—and when I was ready to get off myself, the aerodrome was closed down, and the instructors and pupils sent to another one, and some time had elapsed before we could do any more flying, which meant starting again. This was near the end of July.

This aerodrome was full, with new pupils always arriving, so there was a continual shortage of machines, with the result that when the Armistice was signed I had just passed Category "A," and managed to get on Scouts.

Shortly afterwards the aerodrome was condemned, and flying ceased, and in time we were all drafted off to other aerodromes, there to be demobilised without any chance to do any flying, however eager one was.

I suppose, being English, I shall, with many others, just have to tolerate ie—with several big unpaid clothing bills. I would certainly rather do this than go whining to those whose influence got me into the Air Service, or ask the Air Ministry to look into my case, even though I know that if I had gone into the Infantry I should probably have had my commission from some time past, and now have a decent-sized gratuity to look forward to, as well as knowing my clothing bills were paid.

I am a Public School fellow, and unhappily, much as I tried before I was 18 to join up and get overseas, I was unsuccessful, and now, thanks to the Air Force, I cannot boast of any service overseas.

Surely there must be some Englishman of position who is ready to take up such cases and get things fixed for us in some way or other—either by getting us gazetted as officers, with so many days' pay and clothing allowance, or at least an officer's gratuity.

"HARD-TOUCHED CADET."

FIRST TRIP OF DUTCH SEAPLANES.

Seaplane and flying-boat flights between England and Holland are becoming relatively common, and on several occasions recently Dutch official visitors have chosen the aerial route as speediest and most convenient.

In each case previously it has been British machines which have been provided for such passengers—notably in the case of the Dutch Aviation Mission which made the return journey in British flying-boats. Recently, however, Dutch seaplanes made the flight for the first time to British shores, arriving at Felixstowe for the purpose of taking back to Holland two Dutch medical officers who had been visiting this country to investigate the British system of medical examination of pilots.

On the return journey as neither of the Dutch seaplanes—two-seater float machines of the Friedrichshafen type—were equipped with wireless, a British F.5 flying-boat with two Eagle VIII Rolls-Royce engines was detailed to escort them as far as Scheveningen. At this place the Dutch seaplanes turned inland and following the canals reached Amsterdam where they alighted safely, while the British machine returned to Felixstowe. Both the out and return journeys occupied 1 hour and 55 minutes, and throughout the whole trip the F.5 was in wireless communication with its base at Felixstowe.

FRENCH LONG-DISTANCE FLIGHTS.

The French Aeronautical Department has arranged for a series of long-distance flights to be made by war pilots over various capitals. London, Madrid, Constantinople, Prague, Warsaw, Vienna, Brussels, Amsterdam, and Cairo (*via* Constantinople) are included. Trips will also be made to Tunis, Algiers, and Dakar (West Africa).

JULY 9, 1919.

THE AEROPLANE

VOL. XVII. No. 2.

The Editorial and Advertising Offices of "The Aeroplane" are at 166, Piccadilly, Lond n. W.1.
Telegraphic Address: "Aileron, London." Telephone: Mayfair, 5407.
Accounts, and all correspondence relating thereto, should be sent to the Registered Offices of The Aeroplane and General Publishing Co., Ltd., Union Bank Chambers, 61, Carey Str et, London, W.C.2
Subscription Rates, post free: Home, 3 months, 7s. 6d.; 6 months, 15s.; 12 months, 30s.
Foreign, 3 months, 8s. 9d.; 6 months, 17s. 6d.; 12 months, 35s. Canada, 1 Year, $8.
U.S.A., 1 Year, $8.50c.

ON R 34.

A full account of the voyage of R.34 from Edinburgh to New York will be found in the later pages of this paper, where Brigadier-General Maitland's log is given in full, together with a complete record of the signals made by the ship during her voyage. Meantime the feat calls for a certain amount of editorial comment.

In the first place all writers on the subject seem to have forgotten how much of the success of R.34 is due to the pioneers of airship work in this country. The impression seems to exist that airships have been developed entirely during the war. As a matter of fact very much good work was done long before the war.

Much as we all admire the industry and the engineering ability of those who produced the excellent Zeppelin airships, of which R.33 and R.34 are frequently supposed to be merely very good copies, it must not be forgotten that the Zeppelins themselves owed much to British experiments. At a time when the Zeppelins were ugly slab-sided, ill-shaped craft, we in this country produced, at the Vickers works at Barrow, a ship which was of good streamline shape, with symmetrical rudders, elevators, and fins, very like the Zeppelins of six or seven years later.

This ship, which was jestingly nicknamed the "Mayfly," was a failure because of structural weaknesses due to sheer inexperience, but if those responsible for the ship had had money placed at their disposal, as had the makers of the Zeppelins, there can be no doubt that by the outbreak of war our airships would have been as far in advance of the German craft as were our Trade-designed aeroplanes in advance of German aeroplanes. As in all our other preparations for war, our airships suffered from the meanness of self-seeking politicians, and we paid in blood during the war for the money we saved before the war.

The Pioneers of Rigid Airships.

The men to whom the credit is due for what was good in that early ship were Captain Murray Sueter, R.N., Commanders Masterman and Schwann, R.N., Lieuts. Boothby and Neville Usborne, R.N., and Engineer-Lieut. Randall, R.N.

Captain Sueter, who became, later, a Commodore and a C.B., never lost his faith in airships, but, as Director of the Air Department at the Admiralty, being limited as to the money he could spend and being extraordinarily far-sighted, he, in association with Mr. Winston Churchill, spent what money was available in building many aeroplanes and seaplanes instead of one or two big airships, and thereby saved the British Aircraft Industry from extinction, thus saving the Royal Flying Corps in the Field at its most critical periods, and so saving the British Army from heavy losses. To him, in his retirement we as a nation owe a deep debt of gratitude for his work in helping us to our present position as the leading Air Power, both in airships and aeroplanes.

Commander Masterman became Brigadier-General, R.A.F., and was given a C.B.E. and an A.F.C. for airship work. Commander Schwann became Brigadier-General Swann, C.B., R.A.F., and did much excellent seaplane work, besides being for a period Deputy Chief of the Air Staff.

Lieut. Usborne was killed in a combined aeroplane and airship accident about half-way through the war, and Engineer-Lieut. Randall is lost somewhere in the wilderness of the R.A.F. Lieut. Boothby, now Lieut.-Col. R.A.F., has remained faithful to airships, and has done much valuable work during the war, both in training personnel and in experimenting with airships, to assist the airship section of the R.A.F. in attaining success. One regrets that he, as the sole pioneer of British rigid airships who is an active airship officer, had not the reward of commanding R.34 on her historic voyage. None the less he has the satisfaction of seeing his life's work crowned with success, and of being justified in his faith.

Another Pioneer.

The senior officer on board R.34, Brig.-General E. M. Maitland, C.M.G., D.S.O., though not one of the pioneers of rigid airships, is at any rate a pioneer of British aeronautics, for one first met him when he was making strenuous efforts to induce a Voisin biplane to fly at Doncaster in 1909, and long before that he was an ardent balloonist. He continued to experiment with aeroplanes, and in 1910 or 1911 he smashed both his ankles in a crash with a machine of his own.

Not at all disheartened, he continued to fly, and joined the R.F.C. at its formation, being then a Captain in the Essex Regiment. Eventually he took his aeroplane pilot's certificate in France. Then he transferred to the little non-rigid Army airships, and commanded No. 1 Squadron R.F.C. (Airships and Balloons) at Farnborough until the Navy took over the airships, when he transferred, along with several other Army officers, to the service of the Admiralty.

While serving with the Army airships he acquired the distinction of being the first person to leave a moving airship by parachute. Later on he became the chief apostle of parachutes in this country, and it is to his determination in preaching parachutes and his continual personal demonstrations of their reliability and utility that many of our officers and men owe their lives to-day. And, but for the obtuseness and obstinacy of those who refused to fit parachutes to aeroplanes, in spite of General Maitland's advocacy, many other lives might have been saved during the war.

General Maitland, then a Wing-Commander R.N.A.S., was also responsible—jointly with Lieut.-Colonel (then Squadron-Commander) DelaCombe—for the introduction of kite-balloons to the British Navy and Army. Some day one will tell the whole of the story of that introduction, which is one of the funniest of the whole war, but meantime it may be accepted as history that but for General Maitland's appreciation of the military possibilities of K.Bs. and Colonel DelaCombe's appreciation of their naval possibilities, and their ability in overcoming obstructionists in both Services, we should have remained for a very long time without those useful if inelegant aids to war.

For a long time General Maitland was in charge of all K.B. work for the R.N.A.S., but eventually he came back to airships as such. To-day he is Director of Airship Equipment, a post which, if not quite big enough to give his ability full scope, does at any rate assure that some of his knowledge is turned to good account.

His presence on R.34 as representative of the Air Ministry is eminently satisfactory, for if not one of the pioneers of rigid ships he is at least in the direct apostolic succession, and is a pioneer.

Congratulations.

One has not the honour of knowing any of the operating crew of the ship, so one cannot write of their Service records, but their selection for the voyage is a guarantee of their experience and their success is proof of their ability. To Major Scott, as skipper, one offers the heartiest congratulations on having commanded the first airship to cross between the Old and New Worlds.

Also one congratulates Major Pritchard on being the first to set foot on American soil after arriving by air from Europe. One hopes that these officers and the whole crew of R.34—including the stowaway—will be suitably decorated on their return to England.

Some Minor Reflections.

It is true that R.34 was only some 6 hours faster from shore to shore than the record voyage of the s.s. "Aquitania," and one believes that she was considerably slower than the super-battle-cruiser (said to be "Glorious") which took Mr. Balfour to America in 1917, and is reported to have done the journey from Queenstown to Sandy Hook and back inside six days. But it must be remembered that the whole journey was an experiment, and no risks were taken. It was better to go slow and get there than to drive all out through whatever weather might occur and risk running the engines to death or shaking the ship to pieces. Now that the trip has been done, other airships can start going for trans-Atlantic records, as the steamships did.

Also it is a fact that the distance covered was very much less than that covered by the Zeppelin which flew from Bulgaria to a point far south of Khartoum and back, in November, 1917. The time spent in the air by R.34 was also, apparently, less. But here again the whole trip was an experiment, and North Atlantic weather in July is less settled than North African weather in November.

Future Developments.

With further experience the speed of the airship will become higher and higher, and its range will become longer and longer, till it becomes the recognised vehicle for high-speed, long-range passenger transport. It will probably be true always that the speed of the fastest aeroplane will be double that of the fastest airship, but when the airship attains a speed of 100 miles an hour it will be fast enough for practical purposes, and it will have the advantage as a load-carrier.

At an early date one proposes to publish a Special Airship Issue of The Aeroplane and to give therein as much information as is available concerning the world's airships. It will there be shown that the airship is a much more practical vehicle than many people think. Meantime it may be taken that the voyage of R.34 is merely a demonstration to the populace of the future possibilities of airships. One congratulates the officers and crew of the ship again on the success of their demonstration.—C. G. G.

PEACE CELEBRATIONS.

The Air Ministry made the following announcement on July 3rd:

In order to prevent useless applications and to avoid disappointment it is made known that it will not be possible to permit Service aircraft to be lent for the purpose of giving exhibition flights during the Peace and other celebrations.

A SUCCESSFUL WAR CHARITY.

The Royal Air Force Aid Committee and R.A.F. Prisoners Fund, which has Lady Henderson, D.B.E., for its President and Chairman, has issued its final report, of which the following is a brief resumé.

Lady Henderson began this work on Oct 9th, 1914, and immediately raised £9,000, which sum was expended upon small necessities for every man in each squadron in France, until those articles could be bought at canteens, when the C.Os. of the squadrons requisitioned comforts in bulk.

Hundreds of flying suits and goloshes were sent out during the first winter, and mackintoshes, gum boots and oilskins were dispatched, until they became a Government issue.

The following statistics show the articles sent during the war to all Fronts:—

4,000 books, 5,700 Cardigans, 615 footballs, 5,000 games, 160 gramophones, 1,000 records, 5,160 gum boots, 26,250 handkerchiefs, 6,800 helmets, 9,500 mittens and gloves, 11,800 mufflers, 6,550 oilskins, 850 shirts and vests, 202,335 small parcels, 70,000 socks, and 15,000 sundry articles.

Early in 1915 "first capture" food parcels were sent to each R.A.F. prisoner. In many cases relations of prisoners asked the Committee to buy the food and send out parcels. This led to the institution of a department where inquiries about the missing could be made. Clothing, supplied by the War Office, and food parcels, were sent to all N.C.Os. and men prisoners

In October, 1914, a Fund was inaugurated by Mrs. Sueter for supplying comforts for the men of the Royal Naval Air Service, and for three and a half years the ratings at all the R.N.A.S. Stations, both at Home and abroad, were provided with warm garments, books, games, gramophones, cigarettes, etc., about 200,000 articles being distributed. On the amalgamation of the two Flying Services, it was thought advisable that there should be only one joint Fund for dispensing Comforts; so in June, 1918, the R.N.A.S. Comforts Fund combined with the R.A.F. Aid Committee.

AIR MINISTRY WEATHER BULLETINS.

The Air Ministry issued the following on July 3rd:—

An interesting testimony to the accuracy of the official bulletins, compiled by the Air Ministry, of the weather conditions along the Atlantic course, is furnished by a comparison of the Air Ministry weather charts with those which were formulated independently by the United States Navy in conjunction with the flight of the N.C. Flying-boats to Europe.

Considering the size of the Atlantic and the small number of weather observations received, it might have been expected that there would be considerable differences between the two sets of charts. This, however, has not been the case; in fact, the close agreement obtained is extraordinary.

This result is equally gratifying to the Air Ministry and U.S. Navy forecasters, and it is all the more noteworthy when it is realised that the amount of information at the disposal of the Air Ministry was much less than that available to the U.S. Navy from the fleet of destroyers and battle ships engaged in the operations involved in the U.S. trans-Atlantic flight.

It should be understood, so far as the Atlantic area was concerned that in the case of the Air Ministry, the information on which the bulletins were based was obtained gratuitously, through the Marconi Wireless Telegraphy Company, from the reports of liners and cargo ships, and these observations were at times inclined to be erratic and incompiete, whilst the U.S. meteorologists had the benefit of data obtained from warships provided primarily for the purpose. Observations of the weather on both sides of the Atlantic had also to be taken into consideration, and this information was available both to the Air Ministry and to the U.S. Authorities.

The results secured by the Air Ministry indicate that trained meteorologists can in most cases give as accurate information of the Atlantic weather from reliable weather reports received from merchant vessels and liners as from those received from a string of destroyers. The future of civil aviation will undoubtedly see a great development of this system of obtaining observations for the compilation of weather reports.

THE PORTRAIT SUPPLEMENT.

No doubt, many readers of this paper will wish to purchase copies of the photograph of General Trenchard which appears in this issue of The Aeroplane. Inquiries as to prices should be sent (together with an intimation as to the size of photograph required) to the owners of the copyright, Messrs. J. Russell and Sons, 51, Baker Street, W.1.

MAJOR-GENERAL SIR HUGH MONTAGUE TRENCHARD, K.C.B., D.S.O.,
Chief of the Air Staff.

The WORLD of AERONAUTICS

NEWS OF THE WEEK FROM ALL QUARTERS

An American Bolo.

The aircraft industry of America is clamouring for a consolidated Air Service and an Air Ministry on the British lines.

Now that the war is over perhaps no very great harm would be done.

Official News.

Major-General the Right Hon. J. E. B. Seely, C.B., C.M.G., D.S.O., M.P., Under Secretary of State for the Air, contributed an article to the "Times" of July 4th. It is 16 inches in length, and it states that "America was the first birthplace of practical flight." One regrets that its second birthplace is not mentioned.

The Gentlemanly Thing.

The following letter appeared in the June issue of the "Chloride Chronicle." One believes it is to be taken with a little chloride of sodium :—

Dear Sir,—I am always anxious to do the gentlemanly thing, but, though I have looked through quite a number of books on "Etiquette," I cannot find anything about flying, which is what I am worried about, and I hope you won't mind my asking your advice.

I am dead keen on flying, and have saved up two guineas which is the lowest price for a flight at Hendon (no reduction for children). It has taken me ages to do it, but I don't grudge the money. The awkward part is I have just got the exact sum, and I wonder if you are supposed to give the pilot sixpence for himself like you do a taxi? That would mean waiting a little longer—perhaps a week—but I want to do the proper thing, especially if it's Grahame-White.—Yours, etc., G. I.

P.S.—All the same, I don't see how it could make any difference to the sort of flight they gave you, because the aviator wouldn't know what he was going to get till he had landed—would he?

London's Pride.

According to the "Daily Telegraph" of July 4th, at the meeting of the Westminster City Council, it was decided to erect tablets at places which were struck by bombs in air raids during the war. There are nineteen such places in the Westminster area, and according to a police return seventy-eight people were killed and 167 injured in this district during hostile air raids. The tablets will be fixed subject to the consent of the owners and occupiers of the properties affected. The cost of the tablets will be £266. Chelsea is the only other borough council affected which is in sympathy with the proposal, as Hammersmith, whilst in favour, had the agreeable fact to record that no bombs fell within the borough area. Nine other borough councils were not in favour of the proposal—Bermondsey, Camberwell, Deptford, Lambeth, St. Pancras, Shoreditch, Southwark, Wandsworth, and Woolwich. From the other seventeen borough councils and the Corporation of London no replies were received. One of the members of the council, whose house was among those struck, said he was opposed to the proposal, which he regarded as a waste of public money. The members in favour of the proposal numbered eighteen, and eleven voted against."

One presumes that it will be a great joy to those who gained honour and wealth by evading service to show these tablets to their offspring who ask: "What did you do in the great war, daddy?" They will then be able to boast that though the bombs rained down on London they refused to leave their indispensable labour of inserting currants into buns for the troops in order that they might escape to the comparative safety of the sheltered trenches in France.

One recalls that after the execution of the Spanish fleet by the American Navy at Santiago the United States men-o'-war placed commemorative tablets over the sparsely-scattered shell holes in their hulls, an idea almost as grotesque as it would be to suggest that soldiers should wear an engraved plaque over such portions of their anatomies as had been injured in the war.

The Secrets of Success.

According to the "Times" :—

"One thing is beyond doubt and that is that commercial flying should flourish in America or nowhere at all; for the country in size and shape and terrain and distribution of population favours it to a high degree."

Whereas in this country endless fuss is caused by the aerial transport of dogs.

A Useful Warning.

The members of a certain Club where aviators do greatly congregate are notorious for the speed of their driving and for their careless habit of leaving cars about the street. The Secretary has, therefore, found it necessary to issue a warning, the final sentence of which announces that a member has recently been summoned "for leaving his car on the front of a house," which is not part of the Club's premises.

One has visions of the speed which, despite the best efforts of the brakes, resulted in a car plastering itself successfully on the front of a house like a squashed fly on a wall, and one rejoices that the driver survived to be summoned. These aviators are remarkably hard to kill.

Definitions.

The American "Aerial Age" is funniest as a rule when its humour is unintentional, but the following definitions have some merit :—

A designer is a bunch of erroneous ideas surrounded by the boss.

A data book is a collection of information nobody uses.

Tracing cloth is made to take the high spots of ink erasers.

A checker is a pessimist with a blue pencil, chronic indigestion, and no conscience, who spends his time trying to figure out the other way of doing everything.

The chief is a lucky dog, who holds his job by taking credit for the ideas of his designer.

Not a Good Comparison.

An article which most people will skip eagerly has appeared in an American paper dealing with the future of commercial aviation. The writer thinks that the "air industry" should raise the cry: "Don't ride, Fly," thus adopting the advertising methods of the telephone companies whose slogan has been "Don't write. Phone."

But since the telephones in this country became a State monopoly the injunction "Don't write. Phone" is so often disregarded by people who are in a hurry that the comparison is not a favourable one.

Sea Bathing from Aeroplanes.

According to the Liverpool "Journal of Commerce," "it appears that for commercial purposes large rigid airship stations should be established at distances of 2,000-3,000 miles apart, mainly for trans-oceanic traffic, while the aeroplane would be used for brining passengers. . . ."

But would passengers pay to be brined? Would they not prefer the old-fashioned bathing machine?

An "R.A.F. Soldier's" Revenge.

When an R.A.F. soldier was remanded at North London on Saturday on a charge of damaging a taxicab, the magistrate gave a little advice to the driver.

"Just a word of advice. If you drive a taxicab always be civil to those who wish to hire you. Of course, I know you will never stop if signalled to in the streets, but do not pass by rudely. Do it gently—a smile and a wave of the hand."

One's entire sympathy is with the "R.A.F. soldier," though this is the first time one has heard of the new rating. In future when this taxi driver is smiling and waving his hand at an "R.A.F. soldier," and consequently runs over a staff colonel, one trusts that he will raise his cap in honour of the dead.

Highly-Organised Apathy.

It is announced that 6,527 cars and lorries and 5,282 motorcycles have been removed from Kempton Park since May 28th, and that the scandal of all these vehicles being allowed to rust in peace has come to an end. The work was carried out by a handful of civilians, after it had proved too heavy a task to be dealt with by the vast resources of highly-organised apathy of the military authorities.

A Scandal.

According to the "Daily Express" of July 4th :—"A new feature of Paris life is the aerial sandwichman. A great biplane came swooping out of the skies yesterday between heavy showers of rain, and, flying very low, dropped circulars advertising somebody's new patent fire-extinguisher. The paper drifted down like multi-coloured snowflakes, and, although the nursemaids were scared, children left their games to pick them up." One does not know what an aerial sandwichman may be, but when nursemaids are so frightened that they fall fainting to the ground and their infant charges have to pick them up really one feels that this sort of thing ought to be stopped.

The WORLD of AERONAUTICS (continued)

Summer Fashions in the R.A.F.

The "Daily Mail" understands "that a new full dress uniform for the R.A.F. is under consideration, and that it is to be somewhat lighter in shade than the present uniform." It is further understood that arrangements are being made for an early issue to non-commissioned and other ranks who have not so far been issued with clothing other than the regulation khaki field service pattern.

One feels that this is not in accordance with the best traditions of the R.A.F. Surely the present uniform should be issued to all N.C.Os. and airmen before another change is made. Strong protests are expected from the clothing contractors against the proposed gross economy.

To Indicate Vertical Gusts.

In America aircraft have been used more extensively than in this country to advertise the Victory Loan, and there have been some curious incidents. On one occasion an aviator before starting on his trip informed the Chairman of the Victory Loan Committee over the telephone that he would need a good landing field and would be glad if a landing "T" could be provided. Upon arriving at the town, he found a well laid-out landing field, but, upon getting closer, observed what appeared to be an immense cross standing upright in the centre of the field.

He found this cross to consist of a tree, the branches of which had been sawn off, and a large board which had been nailed to the top. This enormous upright "T" had been painted white.

He had to explain that as a wind vane it was a failure, unless it were intended to indicate vertical gusts.

The Royal Naval, Military and Air Force Tournament.

The following letter has been received :—

Sir,—Being deeply implicated in the inauguration of the work done by the R.A.F. in the Tournament, I venture to protest against the sarcastic article written by your "Mr. G. L. D." on the subject. The machines are not "pups," but one of the latest types of scouts produced in the war. Your writer might have noticed that they are each fitted with two machine-guns; the type is the Pumel.

It was also not recorded that the interplane wires were hooked onto the planes; this is also one of the latest ideas, and was the reason why the planes could be fitted at so great a speed. The engine was constructed to fire on three cylinders in order that its noise might not frighten the audience, and consequently it could do no more than 500 r.p.m. In conclusion, I might add that the pilot got into his machine whilst the planes were being fitted to show the complete confidence he had in his mechanics.

(Signed) .....

[The signature is illegible.—Ed.]

[This is the first time one has heard of this entertaining type of machine, the "Pumel."]

The Engine that Died.

The "Aircraft Journal" of America states that :—

"During the year of Post Office operations a very careful record has been kept of the mechanical causes of forced landings. These have been entirely connected with the motor. There have been a total of 37 forced landings due to motor trouble, which is one forced landing for every 3,460 miles flown.

"Of the motor troubles sufficient to bring down a mail plane six have been due to ignition trouble. Leaking radiators or water lines are responsible for seven forced landings. It is believed that trouble from this source will be minimised by the installation of a radiator in the wing now fastened between the propeller and the engine in a position where it catches the vibrations of both the propeller and the engine."

The information is interesting, but one feels that the last sentence is involved. One has hardly ever seen a wing fastened between the engine and the propeller.

At the end of the report there is a table showing the various causes of forced landings. One explanation reads :—"Thrust-rod broke crankcase; killed motor."

One presumes that had the trouble been merely a broken piston the report would have stated that the engine was ill.

Aeronautical Fiction.

"Wing Adjutant," the well-known writer of aeronautical fiction, has contributed some to the "Daily News." With reference to the trans-Atlantic voyage of the R.34 he has written :—

"The cost of the flight, allowing for depreciation, wages, and running costs, has been estimated at from 30s. to £2 per mile. In order to obtain revenue to cover this a charge of 6d. per ounce per journey would produce a most handsome profit if the full freight was always carried. On this scale an average load of 4½ tons, or little more than two-thirds full revenue load, would pay."

One would like to know upon what facts the estimate of 30s. to £2 per mile are based. One suggests that "Wing Adjutant" has under-estimated the depreciation of an extremely costly machine. The reasoning in the remainder of the article reminds one of the Peace of God (to quote from Mark Twain) inasmuch as it passeth understanding.

A Royal Air Force Volunteer Reserve.

The formation of a Royal Air Force Volunteer Reserve suggested by THE AEROPLANE early in 1914, and since then recommended on many occasions, has been proposed (as an entirely novel idea) by a correspondent who wrote to "The Times" on July 3rd. The following is his letter :—

Sir,—Have the Government fully grasped the outstanding lesson of the struggle now happily concluded—namely, the superlative value of aircraft in war? The country which can command an overwhelming air force, trained and ready, will, at the outbreak of hostilities, be able to deal such blows to its enemy as will positively determine the issue of the campaign. And this within a week of the declaration of war. Do the

The WORLD of AERONAUTICS (continued)

Government propose to throw the onus of maintaining such a force on the League of Nations, or will they undertake it themselves?

May I, as an ex-flying officer and R.A.F. instructor, offer a suggestion? The average life of the flying man is at present about four years; therefore, to enlist an enormous number of young men as pilots in the Regular Air Force would, at the end of a few years, land the force with a big proportion of these young men, useless for war flying and with few vacancies for employment on the ground. In other words, these young men, mostly under thirty, would be "scrap." The present intention is, I believe, to offer temporary commissions, say, for five years. This, whilst ridding the country of any trouble in caring for its scrapped flying officers, offers but a poor outlook for the flying officer. Having given five of the most momentous years of his life to the service of his country, he is cast forth to earn a livelihood against competitors who have had that much start of him.

My suggestion is that a reserve of the R.A.F. be formed with aerodromes adjacent to convenient large towns. Individuals accepted for service in the reserve to attend the aerodrome every week and put in a minimum of three hours' flying and three hours' ground instruction. Two weeks a year to be devoted to annual training. Such a scheme would appeal to every athlete and adventure-lover in the country. To be taught to fly, provided with a machine, and allowed to "aviate" for three hours a week free—why, the authorities would have more young men than they would know what to do with. They could have 20,000 flying officers, the cream of the youth of the country, always in training, at the bare cost of the maintenance of the instructional staff and its equipment. So soon as a pilot or observer showed signs of becoming "dud" and thus failing to pass regularly-held tests his engagement would terminate.

Such a scheme would give to the Government a huge flying *personnel*, ready for instant use in emergencies, at a minimum cost and without interfering with the civilian careers of those it employed.

(Signed) A. W. PHILLIPS, Capt.

A Gift to the Nation.

According to the "Times" "It is understood that Messrs. Vickers, Ltd., who built the aeroplane in which Sir John Alcock successfully flew the Atlantic, are willing to consider the proposal that the machine should be given to the nation. The aeroplane is at present at the Weybridge works undergoing repairs. She has lost her propellers, her nose is bent, and part of her fuselage broken. The engines are intact, but some of the instruments, including the main compass, were taken away at Clifden by souvenir hunters."

The R.38.

The "Evening Standard" announced last week that the Admiralty has embarked on an ambitious programme of airship construction.

"Of the six approved types which have been ordered, the R.38 is already assuming skeleton form, but of the remaining five the plans have just been finally passed. It is expected that R.38 will be launched this year, and that her sister ship will be completed next year.

"The airships, we understand, are to be built by Messrs. Vickers at Barrow; Messrs. Armstrong, Whitworth and Co., at Barlow, Yorkshire; and by Messrs. Beardmore, on the Clyde.

"While the constructional details of the new aerial giants are, for the moment, being officially kept secret, it is known, for example, that the R.38 will be a third as large again as R.33. Her capacity will be three million cubic feet, as compared with the two millions of R.33 and R.34.

"Then, again, R.33 has a total length of 670 ft., and a diameter of 80 ft. R.38, it is expected, will be at least 1,000 ft. long, with a diameter of 90 ft. to 100 ft., with a lifting capacity of 60 tons, as compared with the 30 tons of her earlier prototypes.

"While the R.33 and R.34 have five engines of 250 h.p., R.38 will have seven or eight of 400 h.p., known as the Sunbeam 'Cossack' type. Her speed is expected to be at least 10 knots greater than the 60-70 knots of R.33.

"The R.34 has started on the Atlantic voyage with 18 tons of fuel—sufficient for the double journey. R.38 will be able to carry 30 tons, sufficient for a range of over 8,000 miles. Her lifting capacity will be 60 tons, as compared with 30 tons of the existing types.

"The later ships may be even larger than R.38, and will also differ probably in important constructional details dictated by the experience gained from the performances of R.33 and R.34

"The total cost of each vessel is expected to exceed half a million, with a correspondingly heavy maintenance charge."

Provision of Landing Grounds.

The Air Ministry issued the following on June 25th:—

"Statistics collected by the Air Ministry show that a considerable proportion of the accidents caused by forced landings due to engine trouble or other circumstances might have been avoided if suitable landing grounds had been within sight and gliding distance of the aircraft at the moment of the occurrence of the accident.

"In his speech at the luncheon at the House of Commons, on the 5th instant, the Under Secretary of State for Air referred to this and to the desirability of the provision of numerous emergency landing grounds; General Seely has since addressed a personal letter on behalf of the Air Council to all Lords Lieutenant, Lord Mayors and Governors, on the subject of the selection and allocation by private individuals and public bodies of suitable sites as such landing grounds, with a view to their being inspected, marked out and appointed for this purpose. In this matter, as an interim measure, and until further and permanent arrangements of the nature indicated can be made, Chief Constables of counties can, it is thought, in conjunction with land-owners and farmers, render great assistance.

"A personal letter has also been addressed to the Chairman of the Board of Directors of the various Railway Companies in regard to the painting of the names of places on the roofs of railway stations or other suitable spaces."

A Junior Biplane.

The "Aerial Age," of America, publishes an account of an aeroplane fitted with an ordinary "Indian" motor-cycle engine which was built by H. P. Christofferson, of San Francisco, California.

The standard "Indian" engine is fitted with deflecting plates to eliminate overheating, and its speed is reduced by gearing from 3,000 to 1,200 r.p.m.

The wing spread is 25 feet, the length 10½ feet, the chord 4 feet, and the gap 4 feet 3 inches. The fuselage is built of plywood.

It weighs only 275 lbs., has a speed of 40 m.p.h., a landing speed of 20 m.p.h., and was built to sell at about £80

The Flying Gimlet.

According to an American paper:—

"Lieut. Alan Clark, late of the Royal Air Force, thrilled throngs with the stunts he performed with a Sopwith 'Camel' scout machine, tearing through space at 130 miles an hour as one of the final tests of different type machines for commercial adaptability of the Second Pan-American Aeronautical Convention. . . . The machine spun around like a giant top for a full minute, then dipped suddenly into a nose-spin for a 2,000-foot gimlet towards earth, from which level it was permitted to go through all the stunts that made such wonderful records for the scouter on the Italian and French fronts."

What a lot of interesting facts have been suppressed by the Censorship! Until now, one has heard nothing of these gimlet stunts at the level of the earth.

43 Squadron, R.A.F.

A Dinner will be held for all members of 43 Squadron, R.A.F., at the Criterion Restaurant, Piccadilly, at 7.30 p.m., Friday, July 18th. Those who wish to attend should communicate with Captain John Trollope, Banstead, Surrey, before 15th instant, enclosing cheque for 50s. Beds will be arranged for country members.

Coming Events.

JULY.

The Royal Naval, Military and Air Force Tournament at Olympia open until July 12th.

Saturday, July 12th.—R.N. Air Station Eastbourne Dinner.

Saturday, July 12th.—Summer meeting at Hendon.

Sunday, July 13th.—Special Flying Displays at Hendon.

Friday, July 18th.—43 Squadron dinner.

Saturday, July 19th.—Martinsyde Recreation Club Sports at Woodbridge Road, Guildford.

Saturday, July 19th.—Victory Meeting at Hendon. Speed Contest for Victory Trophy.

Sunday, July 20th.—Special Flying Displays at Hendon.

Friday, July 25th.—The Amsterdam Aircraft Exhibition opens.

Saturday, July 26th.—July Meeting at Hendon.

Sunday, July 27th.—Special Exhibition Flights at Hendon.

AUGUST.

Tuesday, August 5th.—Handley Page Social and Athletic Club's Sports. Starting at 12 midday at Cricklewood Lane.

Thursday, August 21st.—R.A.F. Annual Athletic Meeting at Stamford Bridge.

Sunday, August 24th to Sunday, August 31st.—The "Avenir's" Tour de France Aérien.

PARIS NOTES

No Feminine Records.

The sensation of the week, mild though it may seem to the ininitiated, has been the announcement that the Aero Club here, acting on instructions from the F.A.I., does not recognise women's aviation records—only world records. As France possesses quite a few active women aviators, the announcement has been received not only with consternation but with very bad grace. Thus spoke Mlle. Jane Hervieu when interviewed on the subject: "Do you think under such conditions I should waste time to attempt a record? It would be perfectly useless, and I have not hidden my opinion or my thoughts from the Aero Club, immediately I heard that the commission refused to homologate the latest record of Mme. de la Roche. I am very indignant, and you may say so."

As was to be expected, Mme. de la Roche is even less content to see her latest exploit so ill recompensed. "Nothing would ever have made me believe that such a decision was possible," she said. "The Aero Club knew of my attempt, sent me a 'commissaire-controleur,' and even gave me an official baragraph. After the flight these instruments were sent for verification, and—three weeks later, I received a letter informing me that they cannot homologate my record because I 'have not beaten the record of Casale!' Did they seriously think, when they sent me the baragraph, that I should attempt, or that it would be possible to beat the record of Casale with my little G3 Caudron?"

Certainly there would seem to be need for a little more sympathy and encouragement for aviatrices on behalf of the authorities who control the sport.

The Ligue Aeronautique Prize.

From July 15th this prize will be competed for every six months, and will be given to the French aviator making the longest flight from Paris to a French colony.

A Novel Arrangement.

The Breguet firm compete steadily with the Farman firm in new types of machines or novel modifications or adaptations to existing ones. Thus the latest development is the Breguet, type 14, 300 h.p. Renault, called the "Sanitaire," and which is so arranged that it can carry two passengers in a lying position in the fuselage on a stretcher. Entrance is obtained by means of a lateral door. The arrangement is rather crude, and one notices the absence of any compensating bracing where the entrance has been made.

The Goliath No. 2.

The Farman Frères productions are simply amazing. Surely the Goliath is the machine de luxe in the aviation world at the moment. A look at its lines invites confidence, whilst a look at the interior arrangement sets all the ladies' hearts fluttering, which accounts for the popularity of it for "joy ride parties." Goliath No. 1 is now being overhauled. Meanwhile Goliath No. 2 passed its trials satisfactorily taking up several lots of fifteen passengers; it is a trifle bigger than its predecessor. In honour of the victory fête and the decoration that will be given to Marshal Foch at Versailles, Farman is organising aviation fêtes in the neighbourhood of Versailles on July 6th, 13th, 14th, and 16th.

The Roumanian adjudant Patetif has obtained his civilian brevet at the Farman school at Toussus-le-Noble. This is the third obtained since the Armistice. In spite of war—and peace—prices the condition attaching to Farman's school remain the same as before the war. Pupils learn on a dual control machine of the latest type, and lessons are given over the country.

British Audacity.

"In honour of the Peace," as the French say, a large number of aeroplanes of all makes, sizes, and h.p. evoluted over Versailles at the moment that peace was being signed. According to the French papers the British aviators were well to the fore on account of the audacity of their evolutions: flags, streamers, oriflammes, and toy parachutes were dropped from the machines. It is expected that there will be a repetition of it on the Fourteenth, but on a more grandiose scale!

Latecoere Enterprise.

The big Toulousian firm of Latecoère have at last all their plans and organisation ready for the opening of the postal and air service between Toulouse, Barcelona, Alicante, Malaga, and Rabat (Morocco), foreshadowed in these notes some weeks back. The opening date is given as August 1st.

From Paris to Lake Chad.

It is a far cry, or, rather, a far fly, from Paris to the centre of the Dark Continent; nevertheless, the Adjudant Delalée, a remarkable war pilot, is going to attempt the trip, including the crossing of the Sahara desert. He proposes to do it in stages of 800 kilometres, each varying only according to the situation of the oases. The preliminary organisation, which is considerable for such raids, is proceeding.

Paris to Casablanca.

It is more than probable that ere these lines appear seven aviators, with Adjudant Papcil at their head, will have flown seven Breguet machines from Paris to Casablanca. It is in the nature of a trial trip, because if succesful and the landing risks are not too great to jeopardise the project, the balance of 154 will be sent by air, and possibly another 50 after that. The northern Spanish route will be used. Although at first intended to be done in one day, it is probable that three days will be occupied, so as not to fatigue the pilots too much. Each pilot successful in flying to Casablanca is to receive 2,000 francs for each machine flown and 400 francs towards his return expenses—quite a good proposition for everyone concerned, especially as, at the moment, there are only seven pilots.

Paris-Melbourne.

Poulet, some weeks hence, will attempt to fly from Paris to Melbourne on a Caudron machine in order to avenge the death of Védrines, his particular friend. This was to be Védrines' next flight, had he succeeded in his Paris-Rome-Paris trip.

A Fonck Rumour.

A rumour, spread abroad by the Paris "Daily Mail," to the effect that Fonck had issued a challenge to all British aviators to a race, the choice to be the privilege of the accepter, is without foundation. Fonck is at the moment in Spain, taking delivery of an automobile.

Paris-Madrid.

Romanet's Paris-Madrid excursion ended prematurely at Montmorillon (Vienne) owing to fog. He was carrying also his mechanic and a Spanish journalist.

BELGIUM.

The consulting committee of Belgian aeronautics met on June 24, under the presidency of Colonel A. E. M. Van Crombrugge, commanding the military side. The president read the reply made by the Minister of the Colonies concerning the creation of an aerodrome at Elizabethville, and of a note, saying that aeronautical material seized in Germany by the Inter-Allied Commission of Control will be considered as spoils of war and will not be discounted from any indemnities due.

The committee agreed on the principle of the creation of a single organisation for civilian aviation.

The subscription opened by M. A. Michant to buy Willy Coppens a car has already reached 10,000 francs.—F. T. N.

FRENCH PROGRESS.

The Director of Aeronautics of France has issued a report on certain aerial expeditions now under contemplation by the Military Authorities. These expeditions are destined to link Paris with the capitals of Europe and with the French Colonies in Northern Africa. The routes are as follows:—

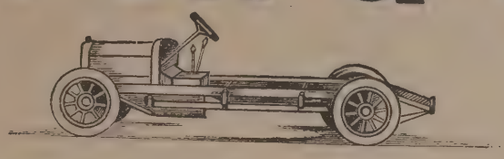
Paris-Madrid, Paris-Prague-Warsaw-Vienna, Paris-Brussels-Amsterdam, Paris-Cairo, *via* Constantinople, Paris-Tunis and back, and Paris-Dakar.

The following machines have been adopted:—

A Nieuport one-seater of 300 h.p.; an S.E.A. two-seater battleplane of 400 h.p.; a Spad one-seater battleplane of 300 h.p.; a two-motor Caudron; a two-motor Farman; a Bréguet 400 h.p., a veteran of the 1918 campaign, on which type Roget made the Paris-Rabat flight.

The following six pilots are indicated as possessing exceptional qualities:—Major Vuillemin, and Lieuts. Fonck, Marinovitch, Flachaire, de Romanet, and Lemaître.

ITALIAN NOTES.



The greatest regret is everywhere expressed at the news of the death of Major Magaldi's brother, a naval pilot, while testing the Magaldi-Rabbeno amphibious chassis on an F.B.A. at Leghorn. Naval Lieut. Magaldi, with a seaman motorist from the Venice station on board, apparently side-slipped at a very low altitude, not being accustomed to the type of machine he was flying. One hopes this sad accident will not tempt the inventors to stop further experiments.

As well as the Rome-Naples route, which has had a regular mail service with four trips a day ever since early in May, the daily service between the capital and Pisa is being run with great precision, as is also the Padua to Vienna mail. The Goia del Colle-Bari to Constantinople via Avlona and Salonica is being prospected too. The other day four Svas and a Ca made an experimental trip, the former in six, the latter in eight and a half hours, the distance being 1,200 kilometres. Major Mercanti, O.C., considers the Avlona-Salonica a most difficult section for want of landing-places. Owing to the great heat at midday at Salonica, where they stopped for an unexplained reason, the motors could not cool down, and a much longer halt had to be made than was intended.—T. S. H.

54, ST. JAMES'S STREET, PICCADILLY, LONDON, S.W.1

THE CROSS-ATLANTIC FLIGHT OF R.34.

On July 1st the Air Ministry made the following announcement:—

"Permission has been given by the Air Ministry for His Majesty's airship R.34 to start during the night on her flight across the Atlantic, subject to the present weather conditions remaining unchanged."

The following day the Air Ministry announced that R.34 had left East Fortune that morning at 2.48 (British summer time) to cross the Atlantic.

Everything was ready at Roosevelt Field, near Mineola, L.I., on July 2nd, for the reception of R.34, and three new wireless stations had been erected in order to get into touch with the airship. She will be moored at Hazlehurst Field (where she landed) until ready to return to England.

Two British cruisers, "Renown" and "Tiger," patrolled part of the course, thus proving that the flight was not merely arranged to give satisfaction and copy to the sensational Press, but was in accordance with Admiralty routine.

On July 5th, H.M.A. R.34 passed over Newfoundland and dropped the mails she was carrying over St. John's. Mr. Raynham, on his Martinsyde, went up from St. John's, to meet the airship.

Unfortunately later in the day she was compelled to call for assistance, and the following message was sent to the U.S. Navy Department at Washington:—

"Could a destroyer proceed, if required, to the southern end of the Bay of Fundy to take H.M.A. R.34 in tow?—(Signed) Commander Lansdowne, U.S.N., for the commander of the dirigible."

Two American destroyers were sent. But R.34 was able to proceed to New York under her own power, and finally landed at Mineola at 2 p.m. on July 6th.

R.34 was in wireless touch with land during the whole of the flight. Ponta Delgada (Azores), St. John's (N.F.), and Clifden (Ireland), besides East Fortune, were the stations in touch on July 2nd, and on July 3rd H.M.Ss. "Tiger" and "Renown" picked up her signals.

The weather during the flight was not good. The airship, encountering bad fogs and head-winds, was forced to make a detour to avoid bad weather.

R.34's SIGNALS.

The following signals were received from or issued concernnig H.M.A. R.34 during the voyage. The times given are G.M.T.:—

July 2nd, 5.30 a.m.—The British airship R.34 passed over Rathlin, County Antrim, at 4.30 G.M.T. (5.30 British summer time) this morning.

9 a.m.—R.34, at 8 a.m. G.M.T. (9 a.m. British summer time), was 10 deg. 40 min. W., 55 deg. 20 min. N. The airship was then taking a course due west at a speed of 40 knots.

11.5 a.m.—Going through thick fog. Everything doing well Time of dispatch 10.5 G.M.T. (11.5 a.m. British summer time).

1 p.m.—R.34 is reported by wireless to have reached at 1 p.m. to-day (British summer time) the position 55 deg. 07 N., 14 deg. 50 W. She was then proceeding at a speed of 32 knots in a thick fog. The officer in charge reports all well.

3.15 p.m.—A wireless message from R.34, at 3.15 p.m. (British summer time), gave the airship's position as 53 deg. 50 N., 17 deg. 50 W. The course then being taken was west true and the speed 31 knots.

5.30 p.m.—The following signal has been received from R.34: "Position at 4.30 p.m. G.M.T., 53.50 N., 18 W.; all well." The Air Ministry adds:—"The position given in the previous signal is probably incorrect, and may possibly have been wrongly transmitted. The position indicated in the above message is very probably correct."

7.23 p.m.—The Air Ministry announced at 6.23 p.m. G.M.T.: "In answer to a wireless message sent from East Fortune this afternoon to R.34, asking whether she was getting sufficient weather reports, the following reply has been received: 'Yes, thanks. We are in touch with Ponta Delgada (Azores), with St. John's (N.F.), and with Clifden (Ireland).'"

8 p.m.—The s.s. "Suffern" reports having sighted the R.34 at 7 p.m. G.M.T. in the position 54.30 N., 18.20 W., steering S., 80.00 W. true.

9.15 p.m.—The Air Ministry announces that Major Scott reported that at 8.15 p.m. G.M.T. R.34 was flying westward at 30 knots and at a height of 2,000 ft.

July 3rd, 4 a.m.—The Air Ministry states this morning that the British airship R.34 wirelessed at 3 a.m. G.M.T. position 52.50 N., 28.10 W.

7.11 a.m.—R.34 reported her position at 6.11 a.m. G.M.T., 52.30 N., 30 W. (Just more than half-way.)

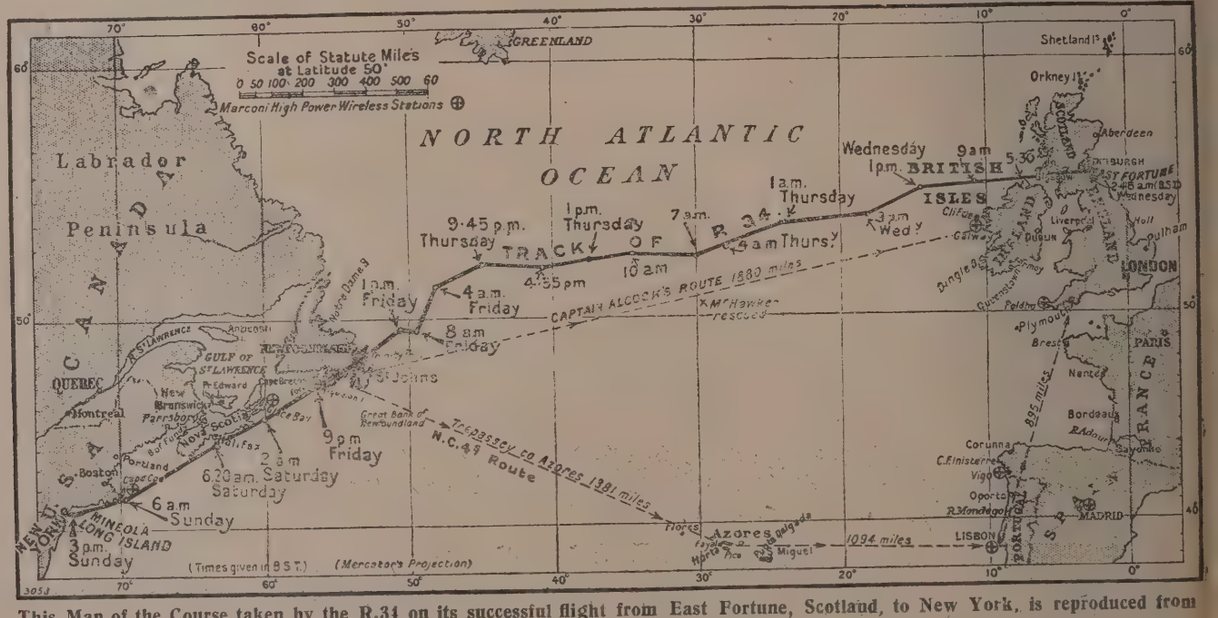
10 a.m.—A wireless message radiated by the R.34 at 10 o'clock (British summer time) indicates that her position at that hour was approximately 52 deg. 50 min. N. and 34 deg. 30 min. W. The airship was then cruising above the fog.

1.14 p.m.—The Air Ministry announces: "The Commander-in-Chief of the Atlantic and Home Fleet has communicated the following message by wireless to the Air Ministry: 'H.M.S. "Renown" heard R.34 wireless signals strength 7 (that is, fairly loud and readable signals) at 12.14 G.M.T.'"

7.30 p.m.—A wireless station on this side of the Atlantic reports having heard H.M.S. "Tiger" speaking with R.34 in the position 54.20 N., 40 W. All apparently O.K at 6.30 p.m. G.M.T.

July 4th, 3 a.m.—48.40 W., 51.20 N.

7 a.m.—49.30 W., 48.40 N.



Noon.—50.25 W., 49.05 N. Clear sky, low fog. (Doubtful message; verification asked for.)

1.2 p.m.—Message from R.34, *via* St. John's: "Flying 3,000 ft. above mist. Sun shining. All O.K."

1.17 p.m.—"2,900 gallons of petrol. All engines running well. 50.20 W., 49.04 N." (Received *via* Western Union Cable Co.)

Untimed.—From R.34 *via* St. John's: "Probably be over St. John's at 4 p.m."

Untimed.—From St. John's, R.34, after making land at Notre Dame Bay, changed her course to the south, and was expected to pass at low altitude over St. John's at 5.30 p.m.

This Map of the Course taken by the R.34 on its successful flight from East Fortune, Scotland, to New York, is reproduced from the "Times" by the courtesy of the proprietors.

Midnight.—59.40 W., 45.45 N.

July 5th, 5.20 a.m.—Going well near Halifax.

Morning.—R.34 encountered heavy electrical storms over Newfoundland and Nova Scotia.

9 a.m.—R.34 sighted over Parrsborough, Nova Scotia.

2.59 p.m.—Signal from R.34 asking for assistance received. Destroyers detailed and R.34 informed accordingly.

6.50 p.m.—R.34 sends the following wireless message:—"Position 45.21 N., 64.00 W. Course true south-west. Running out of fuel after flight (from) Britain. Please tell me if your destroyers coming."

11.9.—R.34 170 miles north-east of Boston.

11.40.—United States destroyer "Bancroft" established contact with R.34 and accompanied her across the Gulf of Maine.

July 6th, 4 a.m.—R.34 sends following wireless message: "Position of R.34 67.30 W., 43.20 N. Course S.W.S. Flying at 1,500 ft. Come and meet us. Making for Boston. Very short petrol."

5.10 a.m.—Message from R.34: "Position now approaching Martha's Vineyard."

5.30 a.m.—Message from R.34: "We are sticking it. Think we will be O.K."

5.38 a.m.—"Will land Montauk and take on petrol."

12.35 p.m.—"Passed Montauk Point; making for Hazlehurst Field, Mineola. Expect land 2, Greenwich time."

2 p.m.—R.34 landed at Mineola, Hazlehurst Field, Long Island, with only 40 minutes' petrol left.

The Arrival.

The Air Ministry issued the following report on July 6th:—

R.34 landed safely at Hazelhurst Field (Mineola, Long Island), at 3 p.m., British summer time, to-day (10 a.m. New York time).

She has thus accomplished her voyage of over 3,100 nautical miles, the longest flight ever made by any aircraft, in 108 hours 12 minutes.

R.34 completed the distance under her own power.

The destroyers which the U.S. Navy authorities dispatched to her assistance as a precautionary measure, in view of her petrol supply being nearly exhausted, were not utilised to take R.34 in tow.

His Majesty the King has sent the following message to the crew of R.34 through Major-General Sir Frederick Sykes, K.C.B., Controller-General of Civil Aviation:—

"Heartiest congratulations to yourself and crew of R.34 on your splendid achievement, and best wishes for a safe return. Your flight marks the beginning of an era in which the English-speaking peoples, already drawn together in war, will be even more closely united in peace."

The crew of R.34 were given a very good reception by the American people, and were entertained to lunch at the Garden City Hotel, Mineola, Admiral Cleaves, U.S.N., being present.

Six hours after the ship left East Fortune a stowaway was discovered. The man, whose name is Ballantine, was until two hours before the airship's departure a member of the crew, but he was then informed that it was necessary to reduce the load and that he would be left behind. He succeeded in hiding between two balloonets until forced to give himself up. It is stated that he will be court-martialled.

R.34, which was moored in the open at Mineola, very nearly met with an accident, but the damage was not serious.

At about eight o'clock on the morning of July 7th the heat of the sun had caused such an expansion of gas that the airship became almost unmanageable in the moderate wind blowing. At times the men of the landing party were lifted off their feet, and at last an urgent call was sent to the neighbouring camps to turn out all available men to man the mooring ropes.

Shortly after, the strain grew so great that the mooring ring in the nose of the vessel tore out. The nose shot straight up in the air, the airship being only held by the after-gondola. Some members of the crew climbed up through the after-gondola and succeeded in making their way forward with a rope, which was lowered to the men on the ground, who were able to pull the vessel's nose down again and make her fast.

Concerning the return of the airship there are conflicting reports, for Reuter's Agency states that the ship is leaving between midnight, July 8th, and 8 a.m., July 9th, and will fly direct to Great Britain. But the U.S. Navy Department state that the ship will go *via* Washington. The times for leaving Mineola are the same in both accounts.

General Maitland's Log.

General Maitland, the official British observer on the R.34, issued the following log history of the airship's voyage from Scotland on July 6th:—

The distances covered were as follows:—East Fortune to Trinity Bay, 2,050 sea miles; Trinity Bay to New York, 1,080 sea miles.

It was originally intended that the flight should take place at the beginning of June, but owing to the uncertainty as to the Germans signing the Peace Treaty the British Admiralty decided to detain the airship for an extended cruise over the Baltic and along the German coast. This flight occupied 56 hours under adverse weather conditions, during which time an air distance of roughly 2,400 miles was covered.

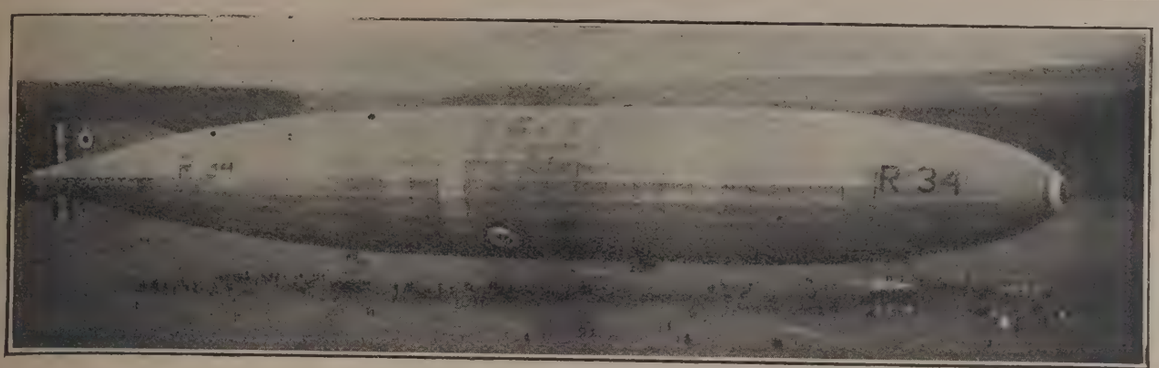
At the conclusion of this flight the ship was taken over from the Admiralty by the Air Ministry and quickly overhauled for the journey to the United States. The date and time of sailing decided upon were 2 in the morning of Wednesday, July 2nd, and Press representatives were notified by the Air Ministry to be at East Fortune the day previously. At 1.30 in the early morning of July 2nd the airship was taken from her shed, and actually took the air 19 minutes later, starting on her long voyage exactly 18 minutes in advance of the scheduled time.

The Flight.

The story of the flight itself is entered in the log as follows:—

1.42 a.m., Wednesday, July 2nd.—R.34 slowly arose from the hands of the landing party and was completely swallowed up in low-lying clouds at a height of 100 ft. When flying at night, possibly on account of the darkness, there is always a feeling of loneliness immediately after leaving the ground. This sense of loneliness was on this occasion accentuated by the faint cheers of the landing party coming upwards through the mist long after all signs of the earth had disappeared.

The airship rose rapidly to 1,500 ft., at which height she emerged from the low-lying clouds and headed straight up the Firth of Forth toward Edinburgh. A few minutes after 2 o'clock the lights of Rosyth showed through a break in the clouds, thus proving brilliantly that correct allowance had been made for the force and direction of the wind, which was blowing 20 miles an hour from the east. It should be borne in mind that, when an airship sets out for a long-distance voyage carrying the maximum allowance of petrol, she can only rise to a limited height at the outset without throwing some of it overboard as ballast, and that, as the airship proceeds on her voyage, she can, if so desired, gradually increase her height as the petrol is consumed by the engine.



An airship of this type, when most of its petrol has been consumed, can rise to a height of about 14,000 ft. For this reason the next few hours were one of the most anxious periods of the flight, for Major Scott, who, owing to the large amount of petrol carried—4,900 gallons, weighing 15.8 tons—had to keep the ship as low as possible and at the same time pass over Northern Scotland, where the hills rise to a height of over 3,000 ft.

Owing to the stormy nature of the morning, the air at 1,500 ft., the height at which the airship was travelling, was most disturbed and bumpy, due to the wind being broken up by the mountains to the north and causing violent wind currents and air pockets. The most disturbed conditions were met at the mouth of the Clyde and south of Loch Lomond, which is surrounded by high mountains, and looked particularly beautiful in the grey dawn light. The islands at the mouth of the Firth of Clyde were quickly passed. The North Coast of Ireland appeared for a time, and shortly afterwards faded away as we headed out into the Atlantic.

The various incidents of the voyage are set down quite simply as they occurred, more or less in the form of a diary. No

attempt has been made to write a connected story. It is felt that by recording each incident in this way, most of them trivial, a few of vital importance, a truer picture of the voyage will be obtained.

Time, 6 a.m., July 2nd.—The airship is running with four engines at 1,600 revolutions, the forward engine being given a rest. Air speed 38 knots. Land miles per hour made good 56.7. Course steered, 298 degrees N., 62 W. Course made good 39 N., 71 W. Wind N.E., 15⅛ miles per hour. Height, 1,500 ft. Large banks of fleecy cloud from the Atlantic gradually blotting out view of the sea. At first we were above these clouds, but gradually they rose higher and we ploughed our way into the middle of them.

7 a.m.—Nothing but dense fog. I intimated to Harris (Captain Guy Harris) that he should go down to within 50 ft. of water and up to a height of about 5,000 ft. Suddenly we catch a glimpse of the sea through a hole in the clouds, and it is now easy to see that we have a slight drift to the south, which was what was estimated by both Scott and Cooke. A few minutes later we find ourselves above the clouds. Our height is still 1,500 ft., beneath a sky with clouds of about 800 ft.

We are therefore between two layers of clouds, a condition in which Alcock and Brown found themselves on more than one occasion in their recent flight. An excellent cloud horizon now presents itself on all sides, of which Cooke at once takes advantage. These observations—if the cloud horizon is quite flat—ought to prove valuable enough to guide, but they cannot be regarded as accurate unless one can also obtain a check on the sun by day or the moon and stars by night. Cooke reckons it easy to make as much as a 50 min. error in locating one's position when using a cloud horizon as a substitute for the sea horizon.

7.30 a.m.—Breakfast, which consisted of cold ham and a hard-boiled egg each, bread and butter, and hot tea. We breakfast in two watches, generally about fifteen in each. Conversation during breakfast reverted to the recent flight up the Baltic, and in the adjoining compartment was a gramophone entertaining the crew to the latest Jazz tunes, such as the "Wild, Wild Women."

Bad Weather Encountered.

General Maitland here gives a list of the *personnel* of R34, and continues :—

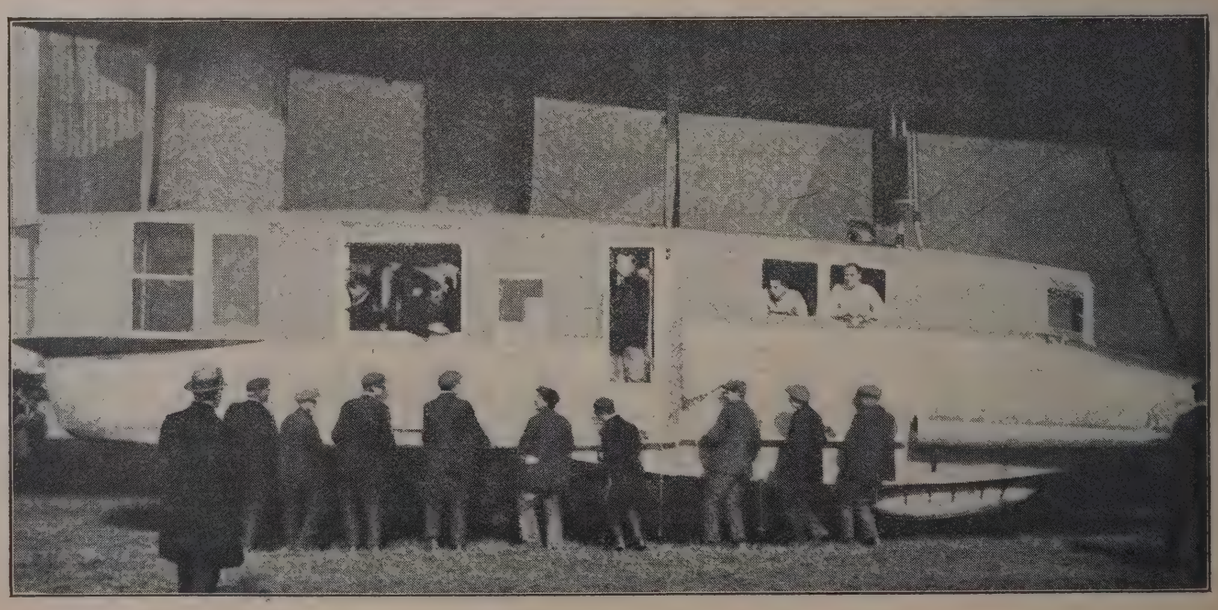
11 a.m.—Still ploughing our way through fog at 1,300 ft. The sea is completely hidden by clouds, and there is no visibility whatsoever. I stopped the forward and two aft engines, and am now running only the two wing engines at 1,600 revolutions, thus giving us an air speed of 30 knots, or 33.6 miles, per hour. This is the airship's most efficient speed, as she only consumes on two engines 25 gallons of petrol per hour. The wind is blowing east at seven miles per hour, and so we make a good 40 miles per hour and are resting three engines.

Major G. G. H. Cooke is now on top of the airship taking observations from the sun and using the cloud horizon with the sextant. The sun is visible to him, but not to us, the top of the ship being 85 ft. above us down in the fore control cabin.

Our position is reckoned to be long. 55.10 N., lat. 14.40 W., which is equivalent to 400 miles from the starting-point at East Fortune and 200 miles out in the Atlantic from the north-west coast of Ireland. We are in wireless touch with East Fortune, Clifden, and Ponta Delgada, and messages wishing us good luck are received from the Air Ministry, H.M.S. "Queen Elizabeth," and others.

11.45 a.m.—Excellent lunch—beef stew and potatoes, chocolate, and cold ——? The talk as usual was mainly "shop," dealing with such problems as the distribution of air pressure on the western side of the Atlantic, and what winds were likely to be met with, what fog we should run into, the advantage of directional wireless for navigational purposes, cloud horizons, and the like. Scott, Cooke, and Harris in comparing their experiences and expounding their theories were most interesting and illuminating.

12.0 noon.—The watch off duty turned in for their routine four hours' sleep before coming on for their next period of duty, which is two hours in this case as it is the first of the two dog watches. The sleeping arrangements consist of a hammock for each man off watch suspended from the main ridge girder of the triangular internal keel which runs from end to end of the ship. In this keel are situated the 81 petrol tanks, each of 71 gallons capacity, living quarters for officers and men, storage arrangements for lubricating oils for the engines, water-ballast, food and drinking water for the crew. The latter is quite a considerable item, as will be seen from the following table of weights :—Petrol, 4,900 gallons, equal to 35,300 lbs. or 15.8 tons; oil, 2,070 lbs., equal to nine-tenth of a ton; water, equal 3 tons; crew baggage, equal 4 tons; spares, equal to two-tenths of a ton; drinking water, equal to 800 lbs. or .42 tons, making a total of 24.32 tons.



Life in the keel of the large rigid airship is by no means unpleasant. There is very little noise and vibration except directly over the engines, and also a total absence of wind, and, except at the early hours of dawn, greater warmth than in the surrounding atmosphere.

Getting into one's hammock is rather an acrobatic feat, especially if the hammock is slung high, but this becomes easy with practice. Preventing oneself from falling out is the thing one must be careful about. In a Service airship like the R34 there is only the thin outer cover of fabric on the underside of the keel on each side of the walking-way, and the luckless individual who tips out of his hammock would, in all probability, break right through this and find himself in the Atlantic.

It is surprising the amount of exercise one can get on board an airship of this size. The keel is about 600 ft. long, and one is constantly running about from one end to the other. There are also the steps in the vertical ladder to the top of the ship for those who feel energetic or have any duty up there. By the time it comes to one's turn to go to bed one generally finds that one is very sleepy, and the warmth of the sleeping bag and the hum of the engines soon bring sleep.

3.15 p.m.—The sea is now visible at intervals through the clouds. It is of a deep blue colour, with a big swell. Our shadow on the water helps us to measure our drift angle, which both Scott and Cooke worked out to be 21 degrees.

Running the forward and two aft engines and resting the two wing engines, we are making good a speed of 49 miles per hour. Durrant, the wireless officer, reports just speaking to St. John's, rather faint but quite clear signals, and we are still in touch with East Fortune and Clifden, and have been exchanging

Distance 190 miles; average speed over 70 miles per hour.

signals with the Azores since reaching the Irish coast. Our communications seem quite satisfactory. We are seeing some remarkable rainbow effects on the cloud. One complete rainbow encircled the airship itself and another encircled the shadow. Both are very vivid in their colouring.

3.45 p.m.—Tea: consisting of bread and butter and greengage jam and two cups of scalding hot tea, which had been boiled over the exhaust pipe. Fruitarian cake was also tried for the first time. Rather sickly taste, but is very nourishing. The whole is being assisted by Miss Lee White on the gramophone. We would one and all give anything for a smoke. Greenland, the first officer of the ship, is vainly trying to discover the culprit who used his toothbrush for stirring the mustard at lunch

4.30 p.m.—Still in fog and low clouds, and the sea is not visible. We have hardly seen any sign of the Atlantic since leaving the Irish coast, and we are beginning to wonder if we shall see it at all the whole way across.

5.0 p.m.—Tramp steamer "Ballygally Head" outward bound from Belfast, destination Montreal, picked up our wireless on their Marconi spark set, which has a range of 30 miles only. She heard us but did not see us, as we were well above and completely hidden by the clouds. She gave her position as Lon. 54.30 N. Lat. 18.20 W., and reported as follows. Steering South-south-west true. Wind north, barometer 30.10 overcast clous low. Suffren, master. They were very surprised and most interested to hear we were R.34 bound for New York and wished us every possible luck.

5.30 p.m.—Messages have been received from both H.M. Battle Cruisers "Tiger" and "Renown," which were previously sent by the Admiralty to assist us with weather reports and general observation. They reported respectively as follows:—"Tiger": Position 36 degrees 50 min. North, 36 degrees 50 min. West: barometer 1,027 millibars, falling slowly; thick fog." "Renown": "Position 60 degrees North, 25 West; barometer 1,027 millibars, falling slowly, cloudy, visibility four miles." Harris's deductions from these reports are to the effect that there was no gradient, and therefore no likelihood of any strong wind in that part of the Atlantic.

6.0 p.m.—Scott increased height to 2,000 ft., and at this height we find ourselves well over the clouds and with a bright blue sky above the view is an enchanting one. As far as one can see a vast ocean of white fleecy clouds ending in the most perfect of cloud horizons. Two particularly fine specimens of windy cirrus clouds, of which Pritchard promptly obtained photographs, appeared on our port beam, also some cirrus-ventos clouds, little curly clouds, like black cocks' tail feathers, all of which Harris interpreted as a first indication and an infallible sign of a depression coming up from the south. We hope that this depression when it comes may help us, provided we have crossed its path before it reaches us. If we can do this we may be helped along by the easterly wind on the north-westerly side of the depression. It is interesting to note that as yet we have received no notice of this depression coming up from the south in any weather reports.

6.40 p.m.—Put back the clock half an hour to corrected Greenwich mean time. Now 6.10 p.m. Position, longitude 53 degrees 50 min. North, latitude 20 degrees West. We have covered 610 sea miles, measured in a direct line, in 17 hours, at an average speed of 36 knots. The depth of the Atlantic at this point is 1,500 fathoms. At this rate, if all goes well, and if that depression from the south does not interfere, we should see St. John's—if visible and not covered with fog as it generally is—by about midnight on July 3rd.

6.55 p.m.—A wireless message from the Air Ministry *via* Clifden states that the conditions are unchanged in the British Isles. The anticyclone is persistent in the Eastern Atlantic, and a new depression is entering the Atlantic from the south. This confirms Harris's forecast, and is admirable proof of the value of cloud forecasting.

7 p.m.—The clouds have risen to our height, and we are now driving through them with no sign of the sky above or the sea beneath. Scott reckons that the wind is north-east by east, helping us slightly. The airship is now very heavy, owing to the change of temperature, and is 12 degrees down by the stern. We are running all five engines at 1,600 revolutions, and our height is 3,000 ft.

8 p.m.—We are just on the top of the clouds, alternately seeing the sun and then plunging through thick banks of cloud. The sun is very low down on the western horizon, and we are steering straight for it, making Pritchard at the elevators curse himself for not having brought tinted glasses. Ship now on a more even keel.

8.30 p.m.—Scott decided to go down underneath the clouds, and increased the speed on all engines to 1,800 revolutions to do so. It is dark, cold, and wet in the clouds, and we have shut all the windows. We see the sea at 1,500 ft. between patches of cloud. It is rather bumpy. We now find ourselves between two layers of clouds, the top one 1,000 ft. above us, and the lower layer 500 ft. below us, with occasional glimpses of the sea.

9 p.m.—Sun now setting and gradually disappears below the lower cloud horizon, throwing a wonderful pink glow on the white clouds in every direction. Course steered 320 degrees, course made good 299. Air speed 45 knots, speed made good 55 miles per hour. All through this first night in the Atlantic the ordinary airship routine—navigating, steering, elevating, and also maintaining the engines in smooth running order—goes on watch and watch as in the day time. The night is very dark.

The airship, however, is lighted throughout, a much enlarged car lighting system having been fitted. All instruments can be individually illuminated as required, and in case of failure of the lighting system, all figures and indicators are radiumised. The radium paint used is so luminous that in most cases the lighting installation is unnecessary.

The Second Day.

8.20 a.m., 3/7.—Clock put back another hour to correct time to Greenwich. Position, longitude 35 degrees 60 min. West, latitude 53 degrees North. Cooke got the position by observation from the sun and on cloud horizon. He considers it accurate to within 30 or 40 minutes. Our position is over the westbound steamship route from Cape Race to the Clyde, and we are momentarily crossing the eastbound route from Belleisle to Plymouth. We are well over half-way from Ireland to Newfoundland, and are back again on the great circle route, having been slightly south of it owing to the drift effect of the northerly wind. Good weather report from St. John's.

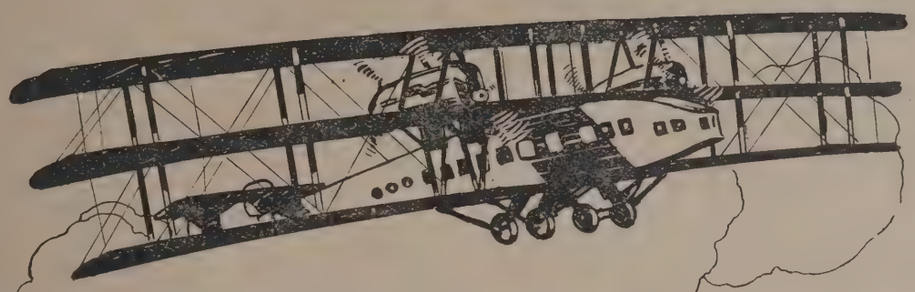
12.45 p.m.—Durrant is speaking to steamship "Canada" on our spark wireless. There may be a chance of our seeing her shortly, as the sea is temporarily visible. The second wireless operator obtains directions on our directional wireless, so we may know in what direction to look for her. All we know at the moment is that she is somewhere within 120 miles. Captain Davis, the commander, wishes us a safe voyage. We gaze through our glasses in her direction, but she is just over the horizon.

2 p.m.—Slight trouble in the starboard midships engine. Cracked cylinder waterjacket. Shotter made a quick and safe repair with a piece of copper sheeting and the entire supply of the ship's chewing gum, which had to be chewed by himself and two engineers before being applied.

4.30 p.m.—Now on the Canadian summer route for steamers bound for the St. Lawrence *via* Belleisle Strait and the well-known Labrador current. There are already indications of these cold currents in the fog which hangs immediately above the surface of the water. Scott and Cooke spend much time at the chart table, with protractors, dividers, stop watches, and many navigational text-books, measuring angles of drift and calculating the course made good. Aerial navigation is more complicated than navigation on the surface of the sea, but there is no reason why, when we know more about the air and its peculiarities, it should not be made just as accurate.

5 p.m.—Harris unwisely shuts his hand in the door of the wireless cabin. Injury painful, but not serious. Flow of language not audible to me as forward engine happened to be running.

6 to 7 p.m.—We are gradually getting farther and farther into the shallow depression reported yesterday coming from the South Atlantic. For the last four hours the sea has been rising. Now the wind is S.S.E., velocity 45 miles an hour. Visibility only half a mile. Very rough sea and torrents of rain. Despite this the ship is remarkably steady. At 8 p.m. Scott decided to climb right through it and we evidently came out over the top of it at 3,400 ft.



8.30 p.m.—We have now passed the centre of the depression exactly as Harris foretold. Rain has ceased and we are travelling quite smoothly again.

To the west the clouds have lifted, and we see an extraordinarily interesting sky, black, angry clouds giving place to clouds of grey mouse colour, then bright salmon pink, and a clear sky changing lower down on the horizon to darker clouds with a rich golden lining as the sun sinks below the surface. Sea is invisible, and is covered with a fluffy grey feather bed of clouds slightly undulating and extending as far as the eye can reach.

The moon is just breaking through the black clouds immediately above us. On the east we see the black, ominous depression from which we have just emerged, while away to the south the cloud bed over which we are passing seems to end suddenly and merge into the horizon. We are getting some valuable meteorological data on this flight without doubt, and each fresh phenomenon as it appears is instantly explained by the ever-alert Harris, who has a profound knowledge of his subject.

9 p.m.—One of the engineers has reported sick. He complains of feverishness. A stowaway has just been discovered, a cat smuggled aboard by one of the crew for luck. It is very remarkable that nearly every member of the crew has a mascot of some description, from the engineer officer who wears one of his wife's silk stockings as a muffler, to Major Scott, the captain, with a small gold charm, called "thumbs up."

We have two carrier pigeons on board, which it has been decided not to use. Anyhow, whether we release them or not they can claim to be the first two pigeons to fly the Atlantic.

A 1000 to 1 Safety Factor in Aeronautics

The Safety Factor—of which the highest ratio is always aimed at by aircraft constructors—is 1,000 to 1 in the case of Triplex Safety Glass—1,000 to 1 against pilot or passengers being hurt by broken glass in even the worst of crashes. It is only Triplex Safety Glass that has made possible the present types of glazed cabins and enclosed passenger nacelles which are playing so important a part in commercial aviation.

All experienced aviators *insist* on "Triplex" for their goggles, for windscreens, observation panels, and instrument covers—because no shock or impact can break it up or cause splinters to fly. "Triplex," of course, is neither wired nor leaded, but it is as clear as ordinary glass despite its unsplinterable tenacity.

THE THIRD DAY.

FRIDAY, July 4th, 4.30 a.m.—A wonderful sunrise, the different colours being the softest imaginable, just like a wash drawing.

7 a.m.—Height 1,000 ft., bright blue sky above them, fog partly obscuring the sea beneath. . . . Sea moderate, with a big swell.

The fog bank appears to end abruptly ten miles towards the south, where the sea appears clear of fog. It is a very deep blue, and standing out conspicuously we see enormous white icebergs. The sun is shining brightly on its steep sides, and we estimate roughly that it is 300 yards square and 150 ft. high. As these icebergs usually draw about six times as much water as their height, we wondered whether he was aground, as the depth of water at that point is only about 150 fathoms. Another big iceberg is seen in the dim distance. These are the only two objects of any kind we have yet seen on this journey.

8.15 a.m.—The fog is still clinging to the surface of the water. Evidently very cold. There is an extraordinary crimpy, wavelike appearance in the clouds which are rolling up from the north. Harris has never seen this before. Pritchard took photographs. Underneath on the port beam there is a long stretch of clear blue sea sandwiched between wide expanses of fog on either side, looking just like a blue river flowing between two wide snow-covered banks. This is caused by a warm current of water, which prevents the cloud from hanging over it. This illustrates the rule that over cold currents of water the clouds cling to the surface.

9 a.m.—We are now over a large icefield, and the sea is full of enormous pieces of ice, small bergs in themselves. The ice is blue-green under the water, with frozen snow on top.

LAND SIGHTED.

12.50.—Land in sight, first spotted by Scott on the starboard beam. A few small rocky islands were visible for a minute or two through the clouds, but were instantly swallowed up again. Altered course to south-west to have a closer look. Eventually made them out to be the north-west coast line of Trinity Bay. Our time from Rathlin Island, the last piece of land we crossed off the shore of the north coast of Ireland, to the north coast of Trinity Bay, Newfoundland, is exactly 59 hours.

2.30 p.m.—We are crossing Newfoundland at 1,500 ft. in thick fog, which gradually clears as we get further inland. Very rocky country, with large forests, lakes, and for the most part no traces of habitation anywhere. Message from St. John's to say that Raynham was coming in his machine to greet us. We replied giving our position.

3 p.m.—Again enveloped in dense fog. Message from H.M.S. "Sentinel" giving us our position. We are making good 38 to 40 knots, and heading for Fortune Harbour.

4.30 p.m.—We have passed out of Fortune Harbour with its magnificent scenery and azure blue sea dotted with little white sailing ships, and are now over the two French islands Miquelon and St. Pierre, and steering course for Halifax, Nova Scotia. The French flag was flying at St. Pierre and was duly dipped as we passed over.

7.45 p.m.—Passed over tramp steamer ss. "Seal" bound for Sidney, Nova Scotia, from St. John's, the first we have seen.

8.15 p.m.—Clear weather, sea moderate; making good 30 miles per hour on three engines. Northern point of Cape Breton Island, Nova Scotia, just coming into sight. We should make Sambre Head 2.38 a.m.

Saturday, July 5th, 2.30 a.m.—Very dark, clear night; the lights of Whitehaven show up brightly on our starboard beam and we make out the lights of a steamer passing us to the east. Strong head wind against us; making no appreciable headway.

7 a.m.—Scott decided to turn inland to avoid S.W. wind barrage blowing off the coast. Crossed coast at Goose Island Country Harbour. Miles and miles of forest. Here and there a clearing with a hut or two; a few cows and an acre or so of cultivated land; any number of small rivers and lakes.

10.20 a.m.—We are down as low as 800 ft. over huge forests. A lovely resinous smell of pines, which we inhale with delight. Stacked tree trunks look like bunches of asparagus from above. Put the wind up a big brown eagle. We all agree we must come to Nova Scotia for shooting and fishing.

12.30 p.m.—Lunch. The petrol question has become a distinctly serious matter. We have been totalling up our available petrol resources with anxious care. We have 500 miles to go to New York, and if we do not get any wind or bad weather against us will do it all right with two engines, assisted occasionally by a third engine. We cannot afford to run all five at once owing to the petrol consumption. Lieut.-Commander Lansdowne, U.S. Naval Airship Service, sends signal on behalf of R.34 to U.S. Naval Authorities at Washington and Boston to send destroyer to take us in tow in case we should run out of petrol during the night. The idea is, we would then be towed by the destroyer during the hours of darkness and at dawn cast off and fly to Long Island under our own power. Let us hope this will not be necessary. It is now raining and foggy, which is the kind of weather that suits us now, as rain generally means no wind.

3 p.m.—Passed Haute Island in Fundy Bay.

3.30 p.m.—For some little while past there had been distinct evidences of electric disturbance. Atmospherics became very bad, and severe storm was seen over Canadian coast moving south down the coast. Scott turned east off his course to dodge the storm, putting on all engines. In this, fortunately for us, he was successful, and we passed through the outer edge of it. We had a very bad time indeed; it is quite the worst experience from a weather point of view that any of us have yet experienced in the air. During the storm some wonderful specimens of cumulus mamatus were seen and photographed. These clouds always indicate a very highly perturbed state of the atmosphere, and look rather like a bunch of grapes. The clouds droop into small festoons.

7.30 p.m.—Now in clear weather again, and have left Nova Scotia well behind us and are heading straight for New York. Particularly fine electrical disturbance type of sunset.

9.0 p.m.—Another thunderstorm. Again we have to change our course to avoid it, and as every gallon of petrol is worth its weight in gold it almost breaks our hearts to have to lengthen the distance to get clear of these storms.

July 6th, Sunday, at 4 a.m.—Sighted American soil at Chatham.

4.5 a.m.—South end of Mahoney Island, Scott is wondering whether petrol will allow him to go to New York or whether it would not be more prudent to land at Montauk.

5.30 a.m.—Passing over Martha's Vineyard, a lovely island and beautifully wooded. Scott decided he could just get through to our landing ground at Hazelhurst Field, but that there would not be enough petrol to fly over New York. Very sad, but no alternative. We will fly over New York on start of our return journey on Tuesday next, weather and circumstances permitting.

Landed 1.54 p.m., G.M.T., Haselhurst Field, Long Island, or 7.54 U.S.A. summer time. Total time on entire voyage, 108 hours 12 minutes.

THE TRANS-ATLANTIC HANDLEY PAGE.

It was stated on July 3rd that Vice-Admiral Mark Kerr, M.V.O., had decided to abandon the idea of flying the Atlantic on the Handley Page, and on July 4th the machine left St. John's for Atlantic City.

The firm had received several invitations to exhibit the machine in the States, and it was decided to take advantage of these offers. The machine carried 1,300 gallons of petrol, Admiral Mark Kerr, Major Trygve Gran, and Mr. Frederick Wyatt. Food for twenty-four hours was taken.

A message from Halifax, N.S., on July 5th stated that the machine had been forced to descend at Parrsborough that morning through engine trouble. The crew were uninjured, but the under-carriage was badly damaged in the landing.

The following cablegram has been received by Rolls-Royce, Ltd.:—

"Engines were splendid when oil feed pipe broke engine worked for at least two hours.—ADMIRAL KERR."

AMERICAN METHODS.

It is stated that the War Department will transport cotton by aeroplane from Americus, Georgia, to Lowell, Massachusetts, a distance of 1,100 miles.

THE LONDON FLYING CLUB.

The Earl of Lonsdale is President, and many distinguished people are Vice-Presidents, of the London Flying Club which it is intended to open at Hendon in July.

A Club House has been erected containing a ball-room and concert-hall to hold about 2,000 people, a dining-room, a lounge, a library, and many other small rooms, with 50 bedrooms for the use of male members.

The kitchens and offices are large, and M. R. Nobile, of Claridge's and the Hotel de la Plage, Ostend, will be responsible for the catering, which should be very good. A Hawaiin band has been engaged, and is coming over from America.

Instruction will be given by professionals in many sports, for which facilities will be afforded.

A flying school has been established on the club aerodrome, which is of about 80 acres. Members can garage their aeroplanes on the grounds, and have them kept in running order. The club will have passenger, two-seater and single-seater machines, and cars will be provided there and at the Ritz Hotel, the West End headquarters.

The ordinary members' annual subscription is £10 10s., members of the Royal Aero and Sussex County Aero Clubs £8 8s., and R.A.F. members £5 5s. At present there is no entrance fee.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

The inquest upon the deaths of Capt. Rawlings and Capt. Dunn in the accident to the Tarrant triplane at Farnborough on May 26th is the subject of a leading article in this issue.

The evidence given and certain facts which incidentally appeared at that inquest seem to have suggested to some people that the Technical Department of the Air Ministry is attempting to keep to themselves technical information which it is essential—in the interests of the British Aircraft Industry—should be freely published. It is not clear whether the Technical Department itself gained any information.

The products of the Blackburn Aeroplane and Motor Company, Ltd., of Olympia, Leeds, are described in this week's instalment of the series on "Modern British Aeroplanes."

An article on the methods adopted by the French Aviation Service for the prevention of fires caused by bursting or perforated petrol tanks will be found on page 153.

The devices are separated into two main divisions, *ea sunt* methods for getting rid of all the petrol carried by emptying or dropping the fuel tanks, and methods for preventing leakage caused either by bullet-holes or by damage in a crash.

It appears that such precautions have been carried to much greater lengths in France than in this country, and it is to be hoped that British manufacturers will now make an attempt to bring their practice at least into line with that of France.

THE TARRANT ACCIDENT.

The evidence given at the coroner's inquest upon the deaths of Capt. P. T. Rawlings and Capt. F. G. Dunn, who were both killed at Farnborough in the accident to the Tarrant "Tabor" triplane on May 26th, brings to light a number of curious points. On the point of the actual incidents of the accident itself two witnesses only—Mr. Tarrant himself and Brigadier-General Brooke-Popham, the Director of Research, Air Ministry—gave evidence.

Their evidence was in general agreement on the point of fact that all six engines were started up, that the machine taxied some few hundred yards with the four lower engines running fairly fast and the upper pair ticking over. It turned and taxied at an increased speed, and the top engines were opened up, the tail rose to an unusual extent, and the machine turned on its nose.

The only novel fact which appears is that, according to Mr. Tarrant, the machine was loaded with about 1,000 to 1,200 lbs. of lead shot in the nose of the fuselage.

No one of the four surviving members of the crew gave evidence as to the occurrence.

General Brooke-Popham stated that there had been an official inquiry into the accident, and that he was instructed to claim privilege for that report.

From the questions asked of various witnesses by Mr. Walter Frampton—acting on behalf of Messrs. Ogilvie and Partners, who acted as consulting engineers to Mr. Tarrant—and from the answers given to those questions, there arise a number of rather important deductions.

It appears that tests had been made on a model of the machine in the wind tunnel at the R.A.E., and the results of the test were forwarded to Ogilvie and Partners.

On the strength of these tests the consultants wrote to Mr. Tarrant stating that the machine was not safe to fly if the figures of the test were to be accepted as they stood. These tests indicated that the machine was tail heavy, to the extent of requiring 20° adjustment (query incidence) on the top elevator to trim at a reasonably high speed—which would leave insufficient adjustment for errors and would entail a severe strain on the pilot.

Upon the strength of this report from his consultants Mr. Tarrant apparently drafted a letter to the Technical Department, on May 23rd, asking to be allowed to postpone the trials until confirmation by the National Physical Laboratory of the correctness, or otherwise, of the R.A.E. tunnel tests.

If the N.P.L. tests confirmed the calculations and experience of his experts—presumably Ogilvie and Partners—he would like to make the tests as the machine stood; but if not—that is, apparently, if they agreed with the R.A.E. tests—he was afraid that further model tests would be absolutely necessary, and whilst these were being made he would like to change the engines and also the undercarriage.

This letter was never sent, and the Director of Research was not informed of its contents—apparently because Mr. Tarrant on the day after drafting this letter called at the Technical Department and discussed the matter with certain officials, who had apparently received the results of the N.P.L. tests to which Mr. Tarrant referred in the draft letter, and who satisfied Mr. Tarrant that the conclusions derived from the R.A.E. tests were false, and who arranged to test the machine on the following Monday morning.

Messrs. Ogilvie and Partners were not informed of the results of the N.P.L. tests or of the decision to fly the machine on that day.

It further appears from the evidence that a civilian employee of the Royal Aircraft Establishment of the name of Grosset formed part of the crew for the special purpose of watching the behaviour of the undercarriage whilst the machine was taxying. Examined on this point Mr. Tarrant explained that there was some question of there being too much elastic on the axles, and thus making the chassis too rigid. There had been no

question as to the strength of the undercarriage to his knowledge.

Lieut.-Col. the Master of Sempill gave evidence that on examining the undercarriages after the accident he had concluded that they had not failed until the machine turned over.

From this evidence the following points seem fairly clear :—

1. That the machine as built was in proper aerodynamic balance according to the calculations both of Mr. Tarrant's design staff and of his consultants, Messrs. Ogilvie and Partners.

2. That tests made on a model at the Royal Aircraft Establishment indicated, on the contrary, that it would be dangerously tail heavy, and that both Mr. Tarrant and his consultants desired to postpone the trials till these tests could be checked by the National Physical Laboratory.

3. That the National Physical Laboratory tests did not confirm those made by the R.A.E., although the fact of 1,000 lbs. of lead ballast being placed in the nose of the fuselage would seem to indicate that there was some suspicion of tail heaviness still undispelled. One thousand pounds in the nose of the machine would be far from sufficient to counterbalance the degree of tail heaviness indicated by Messrs. Ogilvie's report on the results of the R.A.E. tests, so that it may be assumed that only a minor degree of tail heaviness was expected.

4. That on the receipt of this report the responsible officials of the Technical Department decided to test the machine in its then condition, and persuaded Mr. Tarrant to take their view.

5. That whatever the cause of the accident may have been, it was not due to tail heaviness on the part of the machine.

It will thus be seen that in spite of the large volume of evidence produced, and the number of curious facts disclosed, no explanation of the accident has been allowed to emerge.

It has been publicly stated by General Seely that the machine was built for Military Service and that it would not be in the interest of the public services to disclose the results of the official technical investigation into the cause of the accident.

If this is the case, it is distinctly unfortunate that the veil of secrecy was not drawn a little closer.

As the matter stands at present, it is fairly obvious that the Royal Aircraft Establishment's model tests were erroneous and worthless.

Apparently the N.P.L. tests gave widely different results, but the conclusions drawn from them were not allowed to appear. Whether they were equally wrong, or whether they were proved to be correct by the accident but were erroneously interpreted—or merely ignored—by the responsible officials of the Technical Department cannot be known.

But it is difficult to avoid a suspicion that the public interest which is to be served by refusing to disclose the results of the official inquiry is that of maintaining some fragments of a reputation for the departments and officials implicated in the affair.

The failure to inform Messrs. Ogilvie and Partners either of the receipt of the N.P.L. report or of the decision to carry out the test does not in any way dispel these suspicions.

It may safely be surmised that Mr. Tarrant did not employ that firm as his consultants out of pure philanthropy. On the other hand, no sane man would employ a consultant in whom he had no confidence, nor act in a sense directly opposed to the last advice of his consultants without further consultation, unless there were very urgent reason for that course.

Was that reason—by any chance—the refusal of the Technical Department experts to allow important technical data to pass into the possession of civilian engineers?

In this connection it may be noticed that to their verdict of "Accidental death" the jury added the following rider :—

"But we all of us feel unanimously of opinion that something has not come out which should come out. We have not had the evidence of anyone in the machine, and we feel that something has been kept in the background which we should know."

A German Giant Seaplane fitted for commercial passenger-carrying. One of the recent products of the Zeppelin Company's Works at Staaken. This machine is generally on the lines of the four-engined Zeppelin Staaken Giant, described some time ago by M. Jean Lagorgette in this paper, but is fitted with seaplane floats, and has had the nose of the fuselage extended to form a passenger cabin. The power plant consists of four 250 h.p. Maybach engines.

MODERN BRITISH AEROPLANES.

VII.—The Blackburn Aeroplane and Motor Co., Ltd.

Three-quarter Front View of the Blackburn "Kangaroo" (two 250 h.p. Rolls-Royce Falcon Engines).

Mr. Robert Blackburn—the head of the Blackburn Aeroplane and Motor Co., Ltd.—is amongst the earliest of the successful British constructors of aeroplanes.

His first aeroplane was produced in 1910, and a very successful monoplane, fitted with a 50 h.p. Gnôme engine appeared in time to compete in the "Daily Mail" Circuit of Britain race in 1911.

In 1913 the Blackburn firm produced an 80 h.p. two-seater monoplane of very graceful appearance which was extensively flown during 1913, '14, and '15.

During the earlier part of the late war the firm was engaged in building aeroplanes and parts to official design, but during 1916 they recommenced original design work by producing the twin-engine seaplane which eventually developed into the Blackburn "Kangaroo."

THE BLACKBURN TWIN-ENGINED SEAPLANE.

This machine, as built in 1916, was a central fuselage twin-engine folding wing seaplane, with two floats, each beneath one engine nacelle and each carried on an entirely independent chassis.

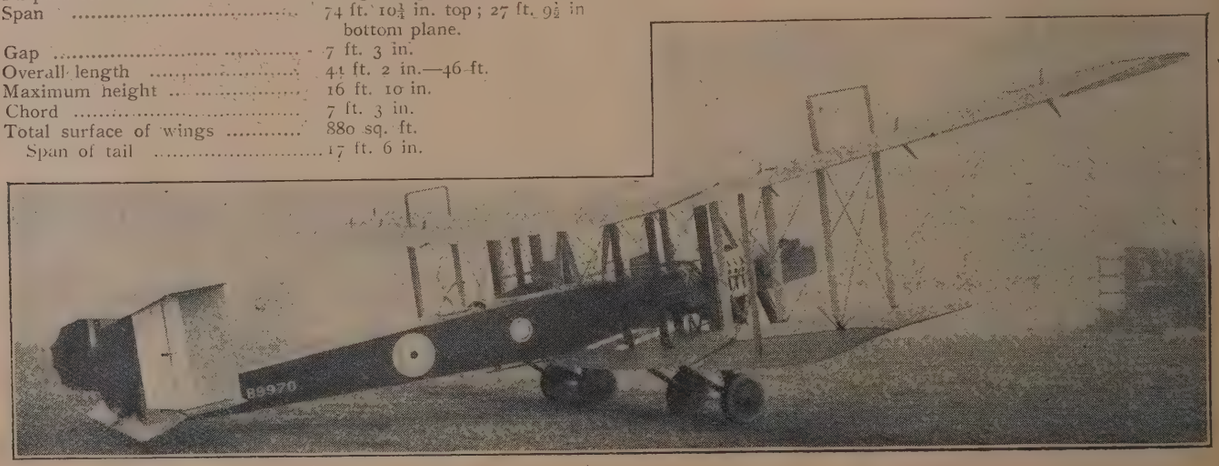
The first example was engined by two 160 h.p. Sunbeam engines, and, with this power plant, it was successfully flown at the R.N.A.S. Experimental Station at Grain.

A second and improved edition, fitted with two 190 h.p. Rolls-Royce engines, was delivered to the same establishment, and gave—for those days—an extraordinary performance.

Apart from the presence of floats instead of wheels the machine was practically identical with the "Kangaroo" hereafter described.

SPECIFICATION.

Type of machine	Blackburn Twin Seaplane.
Name or type No. of machine	S. P.
Purpose for which intended	Long Range Bomber.
Span	74 ft. 10¾ in. top; 27 ft. 9½ in bottom plane.
Gap	7 ft. 3 in.
Overall length	44 ft. 2 in.—46 ft.
Maximum height	16 ft. 10 in.
Chord	7 ft. 3 in.
Total surface of wings	880 sq. ft.
Span of tail	17 ft. 6 in.
Total area of tail	143 sq. ft.
Area of elevators	63.5 sq. ft.
Area of rudder	22.5 sq. ft.
Area of fin	25 sq. ft.
Area of ailerons	166.3 sq. ft.
Maximum cross section of body	12 sq. ft.
Horizontal area of body	105 sq. ft.
Vertical area of body	115 sq. ft.
Engine type and h.p.	Falcon-Rolls, two 250 h.p.
Weight of machine empty	5,840 lbs.
Load per sq. ft.	9.78 lbs.
Weight per h.p.	17.2 lbs.
Tank capacity in hours	8 hours.
Tank capacity in gallons	230 petrol; 18 oil.
PERFORMANCE—	
Speed low down	87 knots.
Disposable load apart from fuel	1,710 lbs.
Total weight of machine loaded	8,600 lbs.



THE BLACKBURN "KANGAROO."

As may be seen from the illustrations this machine is upon the now accepted lines of twin-tractor biplanes.

The most noticeable features are the extreme overhang of the upper plane, and the extreme projection of the front end of the fuselage.

Generally, the construction is on conventional lines.

One point of interest is the design of the metal fittings. Instead of the usual form of fitting built out of steel sheet welded, brazed or riveted together, all the main fittings on this machine are machined from forgings. A typical example, the hinge fitting for one of the lower rear spars, is shown in one of the illustrations.

Three-quarter Rear View of the Blackburn "Kangaroo."

We are informed by
Messrs. Vickers, Ltd.,
the Makers, that

THE WINNER OF THE ATLANTIC RACE

THE BLACKBURN "BLACKBURD" TORPEDO CARRIER.

A large single-engine torpedo carrier designed to operate from either land or the deck of an aeroplane carrier ship.

This machine is of normal tractor biplane type, fitted with folding wings and a chassis consisting of two independent units, with no cross-axle, permitting the slinging and dropping of an 18 ins. torpedo from beneath the centre of gravity.

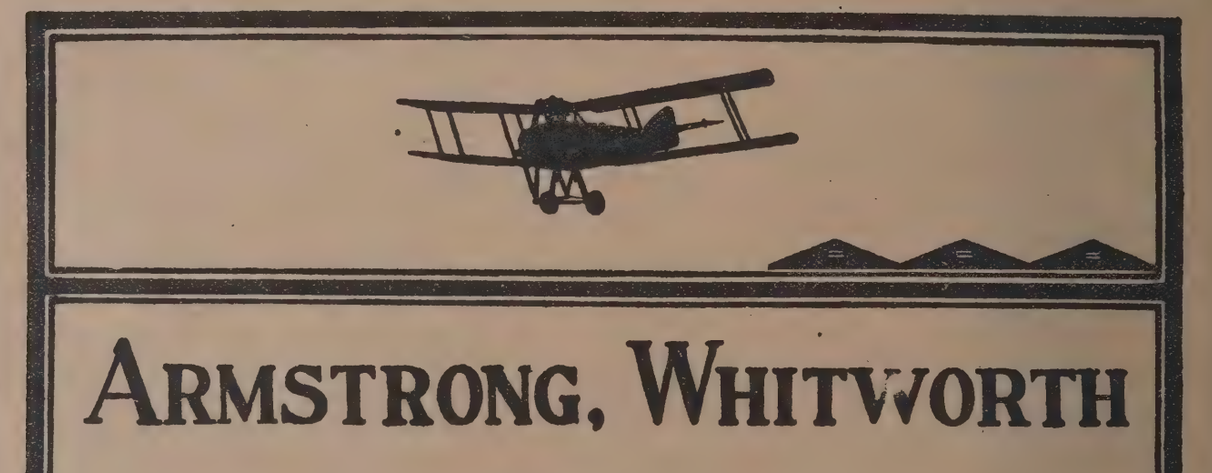
The intervention of the Armistice prevented this—with other equally interesting machines—from passing beyond the experimental stage.

SPECIFICATION.

Type of machine	Tractor Biplane.
Name or type No. of machine	"Blackburd."
Purpose for which intended	Torpedo carrier, for use from ship or land.
Span	52 ft. 6 in. top plane; 17 ft. bottom.
Gap	7 ft.
Overall length	36 ft. 3 in.
Maximum height	12 ft. 4½ in.
Chord	7 ft.
Total surface of wings	709 sq. ft.
Span of tail	17 ft.
Total area of tail	82 sq. ft.
Area of elevators	34 sq. ft.
Area of rudder	9 sq. ft.
Area of fin	18 sq. ft.
Area of ailerons	85 sq. ft.
Maximum cross section of body	11 sq. ft.
Horizontal area of body	80 sq. ft.
Vertical area of body	126 sq. ft.
Engine type and h.p.	"Eagle" Rolls-Royce; 350 h.p.
Weight of machine empty	3,080 lbs.
Load per sq. ft.	7.53 lbs.
Weight per h.p.	15.3 lbs.
Tanf capacity in hours	3 hours.
Tank capacity in gallons	69 petrol; 9 oil.

PERFORMANCE—

Speed low down	92 m.p.h.
Speed at 10,000 feet	84½ m.p.h.



Climb—

To 5,000 feet in minutes	11⅓ minutes.
To 10,000 feet in minutes	33⅓ minutes.
Disposable load apart from fuel	1,680 lbs.
Total weight of machine loaded	5,340 lbs.

HOW FIRE IS AVOIDED ON FRENCH AIRCRAFT.

By JOHN STRONG.

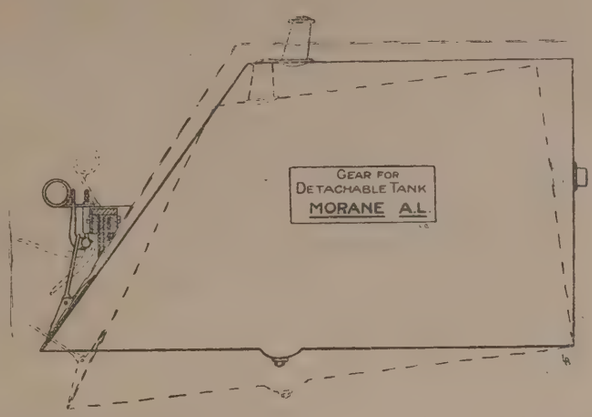
French design was always far in advance of that of other Allied countries in regard to fire-avoiding devices on aeroplanes, and all machines had either detachable or protected petrol tanks, or tanks fitted with rip patches.

In addition, great care was taken with the petrol, oil and water installations to ensure that installation failures should not provoke disasters. All air intakes have to be carried outside the engine fairing and so arranged that communication with the interior of the cowling is impossible, so that the risk from back fires is reduced to a minimum.

Pressure fed petrol delivery is forbidden. Ignition wires are not allowed within one inch of any hot parts of the engines, and must pass under and not over the petrol pipes.

RIP PATCHES.

Rip panels or patches are used as an emergency measure, and consist of a panel sweated over a cut-out portion of the petrol tank. One end of the patch is attached by a cable to a lever which, when operated through its full stroke, entirely rips off the sweated patch. In actual practice, however, considerable difficulty has been experienced, because the strength of the sweated patch is variable and often more than that of the pull exerted by the lever.



This had led to a modification recently approved by the French Authorities for use on the "Spad VII" Fighter. A large opening is provided in the bottom of the tank and covered with a plug or cap which is held in place by an encircling brass band with flanged edges, and made petrol-tight by the use of the conventional washer-packing in a manner similar to the method used on glass fruit jars, where the cap is released by ripping off the band.

DETACHABLE TANKS.

The problem of designing and constructing a petrol tank that could be detached and released from the machine at the will of the pilot has received considerable attention, and actual performance tests have been successfully carried out, first in England and later in France.

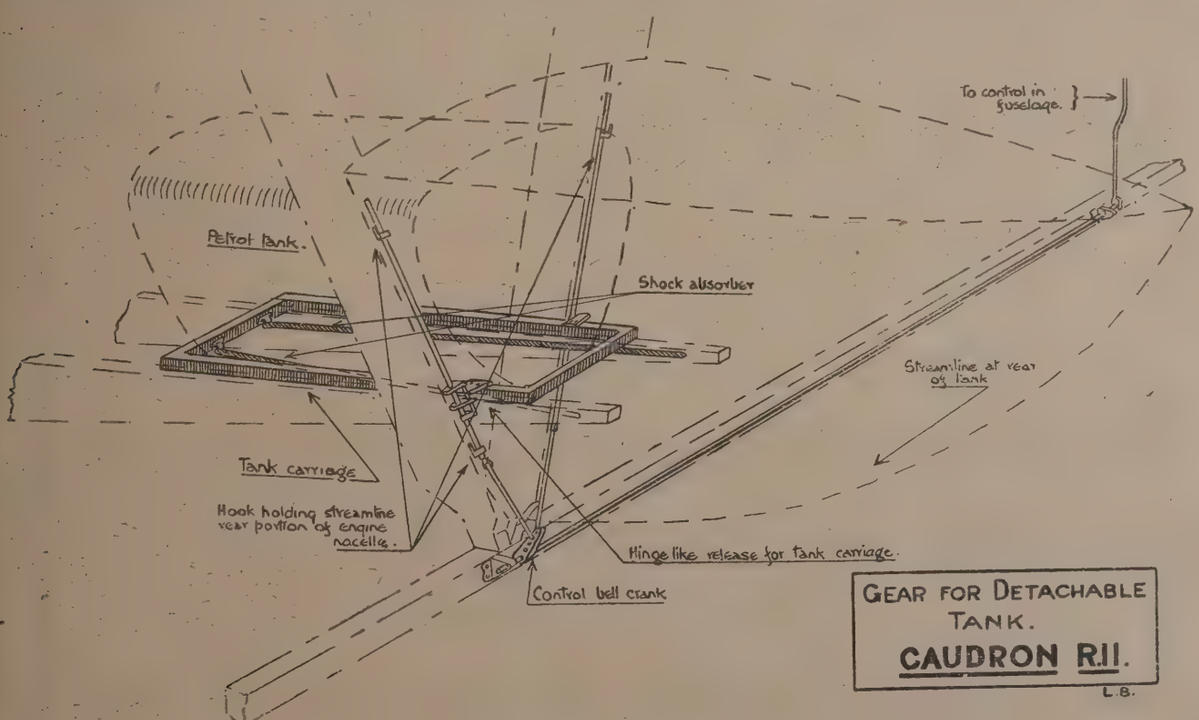
Lieut. Lloyd Lott, of the Canadian Expeditionary Force, has obtained basic British patents on such a device, which, in theory, at least, is applicable to most machines, and he worked out designs for several French machines.

Briefly, he depends on a one point suspension of the tank and holds it rigid by employing a fuselage construction into which the tank is wedged so as to have a surface-bearing on several sides. The bottom of the tank has a panel affixed which conforms to and fits into the bottom bay of the fuselage and takes the place of the cross-bracing wires which have necessarily been removed. Initial impetus at time of release is increased by the use of tensioned elastic bands extending over the top of the tank and fastened on either side.

Lieut. Bernard, of the French Aviation Service, has improved the manually operated releasing mechanism and worked out a design particularly suited to the Spad. His method of construction has been officially approved by the French Government, and the device is now being installed on the Spad XIII.

In this design the rear cross-bracing wires on the landing gear are detached simultaneously with the tank. The tank drops down and is carried by gravity through the space previously covered by the bracing wires and then clears the machine. The whole operation functions from one lever in the cockpit. The same operation shears all the pipe connections. Petrol pipes coming from the gravity tank are previously closed off by a pet cock, or else automatically prevented from wasting fuel by a ball check valve.

The above description applies in a general way to the detachable tank devices in use on other machines, such as the Caudron and the Morane, of which sketches are given here.



OBJECTIONS.

There are several objections to this practice:—

1.—Alterations or interference with the design of the machine.

2.—Possible weakness due to the substitution of the mechanical device for previously designed parts of the machine.

3.—Necessity for cutting all petrol pipes with consequent difficulties.

4. Necessity for an instantaneous and complete detachment of tank from the machine.

5.—Necessity of bringing the machine under control and levelling out before releasing tank.

6.—Danger of fire to the machine as the burning tank drops.

7.—Failure of mechanical parts to function at critical moment due to previous disuse, etc.

8.—Danger of pilot releasing tank without cause, due to nerves resulting probably in a forced landing in enemy territory.

9.—Danger of tank becoming loose due to vibration. (This has happened frequently on the Bréguet with the result that temporary repairs are made at squadrons which render releasing device inoperative.)

10.—In a crash the tank is just as likely to take fire as an ordinary tank, and this has already happened to three postal machines during the last few months.

PROTECTED TANKS.

The idea of covering a petrol tank with India rubber originated with a Mr. Russell, who took out a British patent in 1909, but allowed it to lapse.

Various improvements have been suggested by Thompson, Daigre, Perignon, Lanser, Neal, Imber and other inventors, and the result has been a reservoir which will take 20 or more incendiary bullets without leaking, and the Neal, Sacana and Imber tanks do not take fire even in a bad crash.

Mr. Daigre became interested in protected tanks as a result of some protective armour that he made for the French Government. This material was a light hardened steel upon which a mechanical hard rubber composition was moulded.

For his sample tank Mr. Daigre employed an inner and an outer steel shell and filled the intervening space with a glycerine and gelatine composition apparently similar to that which was at one time used as a filler for so-called puncture-proof automobile tyres. This material was forced in under pressure, and in theory, at least, would close and fill the hole made by the bullet in passing through either tank wall.

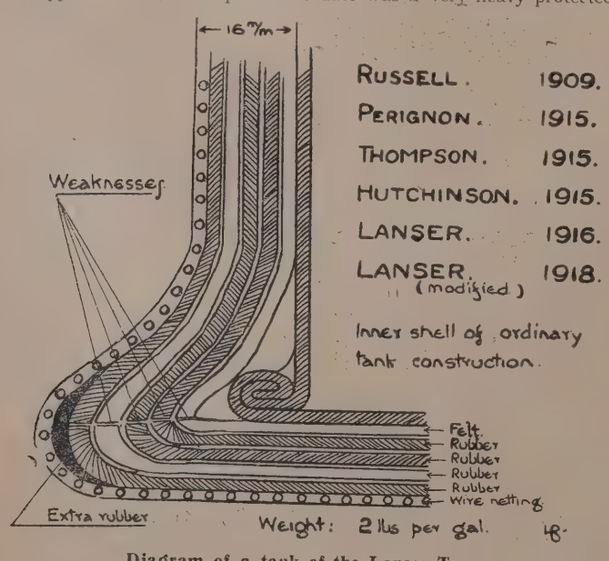
In actual practice it gave a tank excessive in weight and inferior to the Imber and Sacana types. This major fault and other minor ones led to a complete abandonment of this method of protection.

Mr. Daigre has, however, built a petrol tank for armoured fighting "tanks" that has proved very successful, withstanding the burst of a French 75 mm. shell explosion two feet away.

In the summer of 1917 Messrs Lanser and Marbais started to build experimental protected petrol tanks for aircraft. These eventually took the form of a steel tank of ordinary construction covered by a layer of felt ¼ in. thick, and six or more layers of sheet rubber, all of the same kind.

Usually, the inner layer of rubber was about 2 mm. thick and the others 1 mm. thick. One or more of the rubber sheets were separated by coarsely interlaced hemp cord, and the whole structure bound in place by a galvanised wire netting—⅛ in. mesh and finished by twisting the loose strands together and tightening. This development occupied the interval up to the spring of 1918. A funnel was provided at the bottom and escaping petrol percolated down between the sheets and escaped through the funnel clear of the aeroplane. Tests showed the tank to be, on the whole, fairly satisfactory, but heavy.

About this time the French became interested in the possibilities of detachable tanks, and the Daigre and Lanser experiments were stopped. The result up to that date was a very heavy protected tank, but not a leak-proof one, and the weight of three or more pounds to the gallon capacity on tanks of about 50 gallons proved an effective limiting factor to their adoption.



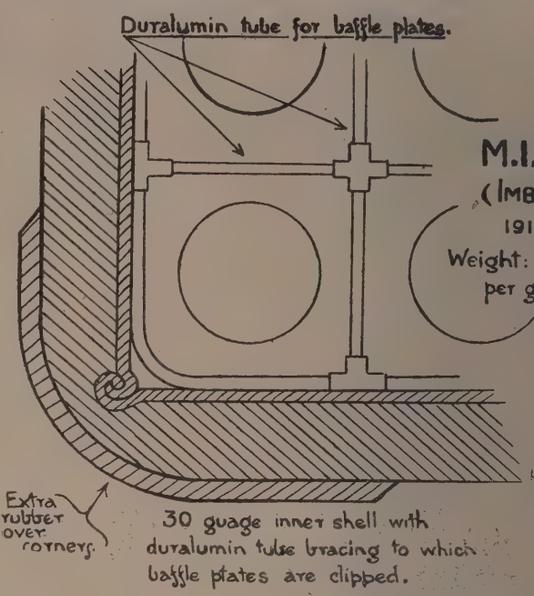


Diagram of a tank of the Lanser Type.

In March, 1918, the Société de Constructions Aéronautiques et de Navigation Aérienne, known as the "Sacana," attacked the problem afresh, and in an intelligent and scientific manner, rather than by the trial and error method heretofore employed. The system of protection, as described in detail later on, overcame the difficulties experienced by Messrs. Thompson, Lanser and Daigre respectively, and a satisfactory fireproof tank weighing about 1 lb. per gallon was produced.

In May, 1918, the Dunlop Rubber Company produced a tank covered with a thick layer of very slightly vulcanised rubber which gave very successful results under machine-gun tests, but the fact that the rubber was so slightly vulcanised rendered it liable to freeze and become brittle at temperatures slightly below 0 deg. C., and the French Section Technique soon realised that it was unsuited to aeroplane conditions.

The next step taken was a so-called "Modified" Lanser tank, which embodied the general principles worked out by the Sacana Company, but with the use of wool shoddy blanket material instead of the canvas used by the Sacana Company, or the wool felt previously used by Lanser. The drain was omitted from this tank, but the wire mesh covering was still retained. It was this composite tank which was thoroughly tested and approved by the Section Technique and adopted by the French Government. Its weight was just over 2 lbs. per gallon. The "Sacana" tank is also being adopted.

The United States Technical Section kept in touch with the French and British developments, and, as a consequence, recommended the "Sacana" tank for installation in the Sopwith Dolphins with 300 h.p. engines built in Paris for them. The Dolphin was arranged for a non-pressure system.

They also ordered "Sacana" tanks for DeH.4s and Nieuports and "Modified Lanser" tanks for their Bréguets.

It is to be noted that owing to the outer shell certain designs of tanks that cannot be built by the "Lanser" System, can be by the "Sacana." (See detailed descriptions of the respective tanks.)

It is also to be noted that the French Authorities are planning to continue the protection of tanks on their aeroplanes for peace conditions, both military and commercial, both as a means of reducing the fire risk in case of a crash and to obtain lower insurance rates, and from the latter point alone the protected tank should more than pay for the increased cost.

THE "SACANA" FIREPROOF TANK.

The "Sacana" tank may be best described as a semi-rigid type. Essentially, it consists of an inner metal shell of medium gauge covered by fabric and layers of vulcanised rubber of varying degrees of elasticity and of outer layers of fabric and a metal covering. The general purpose is to make the tank sufficiently rigid to:—

(a) Be borne on ordinary bearers, and so to be interchangeable with tanks of ordinary design. This permits dispensing with the use of special cradles, etc.

(b) To offer so much resistance to the bullet that, though it enters the tank, it will not merge on the far side. This actually occurs in most cases, and thus avoids the serious injury more apt to occur with the exit bullet hole.

(c) To keep the tank intact and leakproof in case of a crash.

All rubber is vulcanised before being applied to the tank, and the

"GWYNNE LONDON."

Each sheet of rubber of different elasticity
(This was afterwards copied by Lanser)

vulcanisation is sufficient to keep it from freezing at high altitudes. British tests have shown such rubber to be satisfactory at a temperature of 30 deg. below zero Fahr.

The inner shell is made of aluminium or plain sheet steel. All corners are given as large a radius as possible—at least 2 ins.—and the sides are corrugated sufficiently to allow for the liquid pressure set up when the first shot enters, and the shock in a crash.

Joints are preferably welded, but can be lapped and riveted and soldered. Baffle plates are made in the ordinary way, and spot welded to the shell, but are given a small radius at the sides, so that they "give" in a crash.

Large tanks for bombers and passenger machines can have several small inner shells instead of using one large tank and baffle plates. Tanks have been built for the Caproni after this method. The several inner shells are bound together by the covering and the outer metal envelope. This gives a quick production job.

The covering consists of the following layers :—

1. Strong canvas as used for motor tyres.
2. Fine ramie cloth or discarded aeroplane fabric.
3. 1½ mm. of well vulcanised rubber.
4. 1½ mm. of rubber lightly vulcanised or Dunlop rubber.
5. 1 mm. of rubber well vulcanised.
6. 1½ mm. of rubber well vulcanised (for bottom of large tanks only).
7. Thick ramie cloth or discarded (rejected) aeroplane fabric.
8. Outer metal envelope of thin aluminium.

Note.—One layer of thick ramie cloth can be used instead of No. 1 and 2 together. The strong canvas takes up the burrs made when the shell is pierced and the fine cloth prevents the canvas from forming a wick of broken fibres through the rubber. Chemical action between the metal shell and the rubber is also prevented.

The rubber sheets are cut to shape from patterns and applied to the shell by women. The edges are lightly drawn together by sewing. The main joint is along the top of the tank and the others along the round corners. Joints on successive sheets must not coincide. When the sheet is in place the sewn edge and two inches each side of the edge are given a good coat of rubber solution, and the reinforcing strips are then applied to the corners. This amounts to thickening up the corners by a cold vulcanisation process, and the operation is repeated for each successive sheet.

There is a distinct advantage in using thin sheets of rubber previously vulcanised both for inspection and application. This advantage is still further increased by using sheets of different elasticity (by the use of different rubber gums or by varying the vulcanisation), for when the bullet has passed through, the fracture takes a somewhat different course for each sheet with a resultant overlapping of the different rubber sheets, and the tank is immediately sealed.

A light coat of soft soap, with a certain amount of salammoniac, is applied to each layer before putting on the next to prevent self-vulcanisation, and permit a slipping of one sheet upon the other. Paraffin wax has the same effect and can be used if desired.

The fabrics are soaked in any approved fireproofing solution and dried before using.

The heavy cloth is applied outside the rubber before putting on the outer shell in order to evenly distribute the stress set up by the static liquid pressure when the tank is pierced. This prevents the often-experienced tendency of a tank to leak on the first or second shot, and then catch fire from the exuded petrol.

The outer shell is made of aluminium because it is lighter than wire mesh, takes the shock better, makes a more rigid tank and holds the rubber firmly in place around difficult contours impossible with wire netting, affords a secure method of attachment and makes a cleaner-looking job.

The outer shell should always be of a softer metal than the inner shell. If desired the exterior shell may be dispensed with and the outer fabric given a coat of metallic dope or paint instead.

The finished tank can be provided with standard fittings, and the tanks do not require special packing for shipment. The finished weight of the tank is approximately 1 lb. per gallon capacity, the total thickness of the covering being ⅜ in. only.

The Lanser Protected Tank.

This is a development of the Russell and Thompson patents and of Lieut. Perignon's tank, which was made and tested in February, 1914. The method of manufacture is the same.

The inner shells of the Lanser tanks are made exactly like ordinary unprotected tanks without any special study in design or manufacture. This probably accounts for their early production tanks being unsatisfactory, and led to the introduction of a modified type.

The covering originally consisted of one layer of ¼-in. thick felt, 4 to 7 layers of rubber of the quality used for inner tubes of cycle tyres, and iron wire netting outside to hold all in place. A soft soap composition was applied between each layer of rubber to prevent self-vulcanisation.

In building up, no care was taken to thicken the protection of the corners. The edges were lightly drawn together by sewing only. On only the last layer was any proper joint made, and this with a strip of rubber only 1 mm. thick, so that instead of being reinforced at the corners there was only 1 mm. of rubber in all.

The Modified Lanser Tank.

This is the tank made to the Section Technique specifications, and was very satisfactory for war machines, though heavy.

The layers used are :—

A.—5 mm. sheet of baize or similar fabric
B.—1 mm. of well vulcanised rubber.
C.—4 mm. of non-vulcanised Dunlop rubber
D.—1 mm. of well vulcanised rubber.
E.—1 mm. galvanised iron wire netting.

12 mm. total thickness of covering.

Weight, 2 lbs. per gallon.

The corners were not thickened up, and although these tanks gave good results under French tests, they have not withstood the more severe British tests. This is only natural, as the known principles of inner shell construction were not applied.

Existing Patents.

1. Russell (British), 1909.—Rubber-covered ordinary shell patent lapsed in 1913.

2. Perignon (French Lieut.), February, 1915.—Original patent, merely suggests covering an ordinary tank with rubber, which is the Russell invention. Two additions were taken out, making it quite similar to the Lanser and Hutchinson patents.

3. Thompson (British), 1915 and 1917.—Double shell with rubber between. Walls made to move to close leaks.

4. Daigre (French).—Several patents, all in 1915. The principle covered is that of a double metal wall with synthetic rubber forced under pressure between the walls. Effective but far too heavy. Mr. Daigre also experimented with an inner wall of celluloid.

5. Hutchinson (French), November, 1915.—By the Hutchinson Rubber Co., provides a rubber-covered tank with a space between the cover and the tank which might be an air space or a sheet of felt, cork, cotton wool, or any light material.

6. Lanser (French and Belgian), November, 1916.—Lanser specifies laminated rubber with felt directly on the inside shell. In addition, he specifies a double wall of rubber with a space between created by a thick cord net and a drain cock at the bottom of the tank from which the petrol can be led outside the fuselage. The outside layer is one of wire mesh for binding purposes. The inner shell is of ordinary construction.

7. Loretan (Swiss), 1916.—Taken out by Joseph Carrier and L. M. Loretan for a tank covered with rubber or similar material inside or outside the metal shell—or both.

8. Neal (British), February, 1918.—A flexible but not flabby inner shell of special construction with laminated fabric and non-freezing rubber covering; each sheet of rubber to be of a different elasticity with an outer covering of metal.

9. M. I. D. Imber (British), February, 1918.—A specially constructed inner shell covered with a thick layer of special rubber vulcanised in place.

10. Dunlop Company (French), May, 1918.—A special rubber for covering self-sealing tank combined with fabric and non-vulcanised, so that it is likely to freeze at comparatively low altitudes but otherwise is very effective.

11. Sacana (French and British), 1918.—Various additions by the Sacana Co.; to the Neal and Daigre patents, affecting improvements in tank construction and the manner of applying the rubber covering.

12.—Several other variations have been made by various inventors, including a double metal shell with a fire-extinguishing liquid between the walls and a number of these patent specify that the materials capable of fire-proofing shall be saturated with any one of several fire-proofing compounds.

It will at once be apparent that continental differs from British practice in one very essential point affecting production.

The British Imber tanks have a flabby inner shell, on to which raw rubber is moulded, and the whole is then put into a large oven for vulcanising. The difficulty of this process for large tanks for commercial machines is immediately apparent.

In the Sacana construction, which is now coming into general use, for instance, the rubber is already vulcanised, and can be inspected and tested before application, and the covering process does not require the large space demanded for the British type.

The finished tank, though sufficiently flexible, is rigid enough to be carried on ordinary bearers without special cradles, and the outer aluminium sheathing protects the rubber from humidity, petrol and oil, so the tank is equally protected after some months of service, whereas with the rubber exposed it is necessary to change the tank about every four or five months.

It is already known that a tank with a large bore air pipe is less likely to take fire than one with a small bore pipe. This is because a slight depression is caused in the tank by the suction of the slip stream passing across the top of the ventilation pipe. If a small Badin trumpet is fitted the effect is increased, and it has been suggested by the Sacana Company that this would be a temporary precaution to take with all existing unprotected tanks until proper fire-proof tanks can be fitted.

By the adoption of these fire-preventing devices, the Continental Aerial Transport Companies are not only gaining the confidence of the public, but reaping the benefit of lower insurance premiums

POWER ALCOHOL.

The report of the Inter-Departmental Committee on Alcohol for Power and Traction Purposes, issued on June 30th, is of very great interest and importance in view of the present price of petrol and the unlikelihood of that price dropping appreciably.

It may be doubted whether alcohol, or any mixture containing a large proportion of alcohol, will ever become a satisfactory fuel for aero engines, because, owing to the large oxygen content of alcohol, a considerable amount of useless weight has to be carried with such a fuel.

A fuel largely composed of alcohol can be used with quite satisfactory results for road transport however, and the production of such a fuel in quantity at a lower price than that of petrol will at least check the rise in the price and release larger supplies of suitable fuel for aeroplane engines.

The report points out that the petrol and benzol now in use are derived from deposits of definite extent which cannot be renewed, and there is, therefore, a definite limit to the amount of such fuels which can be produced.

The raw material from which alcohol is produced on the other hand can be grown as a crop and renewed indefinitely, and there is practically no limit to the amount which can be manufactured.

The only weak point in the argument in favour of extensive fuel-alcohol production is—as was pointed out in this paper some weeks ago—that the question as to whether a better fuel cannot be produced by distillation from equally easily produced crops has not yet been properly investigated.

At the moment the argument for alcohol stands thus:—

The demand for petrol has increased at a rate far in excess of that which the petroleum deposits can maintain for very long The extent of this increased demand in the United States of America is shown in the following table:—

Year.	Total Consumption. Imp. Gals.	Increase over previous year. Imp. Gals.
1914	1,200,000,000	—
1915	1,400,000,000	200,000,000
1916	1,680,000,000	280,000,000
1917	2,320,000,000	640,000,000
1918	2,680,000,000	360,000,000

The Committee's report discloses the fact that the London General Omnibus Co. are at the moment running a fleet of their 'buses on such a fuel. This trial is to extend for about 26 weeks, and the difference between the cost of the fuel and that of petrol is being borne by the funds of H.M. Petroleum Executive.

The present price of alcohol prohibits commercial use—but the price is due in the main to the properties of alcohol as a beverage, and to the excise restrictions upon its manufacture and sale.

The process of denaturing at present insisted on in this country to render methylated spirits unpotable is costly, and not entirely effective, and the excise restrictions on fermentation and distillation, together with other restrictions regarding transport and distribution, add greatly to its cost, and the Committee's recommendations are mainly confined to the desirability of the removal —as far as is consistent with safeguards to the Revenue, and against the improper use of power alcohol—of all restrictions tending to increase this cost.

THE NAPIER-ENGINED DeH.9 IN SPAIN.

The accompanying photograph taken at Quatros Vientos Aerodrome at Madrid shows the DeH. machine with the 450 h.p. Napier "Lion" engine which has been flown in Spain by Major de Havilland.

The machine is, apart from the engine, a standard Airco DeH.9, and according to Major de Havilland the engine has done everything asked of it.

In addition to flights from Madrid to Seville and Madrid to Barcelona and return, Major de Havilland has given numerous demonstration flights before H.M. the King of Spain and the Spanish Military authorities.

THE AIRCRAFT TRADER

MARKET TOPICS.

PRICES ARE FOR QUANTITIES ON USUAL TERMS.

JULY 3rd, 1919.

COPPER.—This market continues active, but it is not in a very healthy condition, as there is a great deal of uncertainty; consequently, the market tends to be sensitive. The recent advance in prices was undoubtedly operated from America, and although prices have been easier this week, the present level does not reflect the real state of the market. Actually, consumers are showing very little interest in the metal.

The American market is still being influenced by expectation of large purchases from the Central Powers; it remains to be seen whether the demand will come up to expectations. The general opinion here is that it will be some time before appreciable orders are received from that quarter.

COMPARATIVE PRICES.

	Per Ton. £ s. d.
To-day, July 2nd	80 0 0
Last week	88 2 6
Last month	76 17 6
Average price, 1918	115 11 0

TIN.—There is not much activity at present, although prices keep steady. The demand is dull, and consumers are not showing any interest whatever. Although the embargo on the importation of Tin to U.S.A. has been lifted, it is not yet certain that there will be a big demand from American buyers, there are various reports being made as to the possibility of a big business being done. The situation is obscure, and the reports referred to should be received with a great deal of reserve.

COMPARATIVE PRICES.

	Per Ton. £ s. d.
To-day, July 2nd	240 0 0
Last week	240 15 0
Last month	232 7 0
Average price, 1918	329 11 0

LEAD.—There has been a fairly brisk demand recently, but dealers are well to the fore; consumers are not showing much interest. It does not look as though the Government are disposing of their stocks as was expected, and the demand for Government stock is likely to be less, as Spanish holders appear to be pressing for orders, and it is quite probable that they will sell at a lower figure than the Government.

Further, it is reported that Germany is selling Lead in Holland at a lower level than the price ruling here. The present price is certainly not unreasonable, considering the present level of costs, but the features referred to above, also the huge stocks held by the Government here, do not create confidence among consumers.

STEEL.—The Steel market at present is in a very unsettled condition, and firms who are compelled to buy are merely covering themselves for their immediate requirements. There is very little confidence in the market, and consumers show no disposition to buy ahead. Steel makers have recently informed their customers that commencing July 1st, Billets will be advanced 20s.

The continual advance in price is primarily responsible for the unsettled state of the market, and it is no use disguising the fact that American competition is becoming still more severe. Furthermore, there does not appear to be much hope of any fall in the prices which are being charged by British makers: in fact, some of the makers still insist upon quoting an indefinite price, i.e., their quotations include a "rise in price" clause.

Glasgow Corporation recently placed an order with America for 5,000 tons Steel Rails at a price 32s. 3d. per ton cheaper than the best British quotation. It is also quite possible that American firms will shortly be able to quote even cheaper prices, as there has been a recent reduction in freight charges.

There is still a slump in the High Speed Steel market; in fact, it will be some time before the huge stocks, which are held in various parts of the country, have been used.

TIMBER.—The demand for all kinds of Timber is fairly active, and undoubtedly has shown much improvement during the past month. Unfortunately, there does not appear to be much improvement in the shipping problem, and it is quite probable that it will become much more serious now that Peace has been signed, as the demand for shipping will undoubtedly increase.

When the control of Timber ceased about three months ago, there was hardly any Yellow Pine in the country, and the shipments which have arrived since that date have been divided up among several merchants. The quantities were not large, and there is a big demand for the Wood; consequently, some firms have taken advantage of the position, and have been charging outrageous prices. The Controller is determined to stop this, and the attention of buyers is called to a notice which has been issued by the Board of Trade, and is inserted in this paper.

The Hardwood market is in a fairly healthy condition. The demand is quite active, and prices are showing an upward tendency. There is at present a shortage of Silver Spruce suitable for Aeroplane work, and there is still no sign of shipments coming forward.

FABRIC.—There are no further developments in this market at present.

BOARD OF TRADE ANNOUNCEMENTS.

The following announcements have been made by the Board of Trade:—

EXCESSIVE PRICES OF YELLOW PINE.

The Board of Trade announce that the Controller of Timber Supplies has had brought to his notice the fact that excessive prices have been asked for yellow pine in spite of the announcement made on May 20th last that there is no reason why the maximum prices which were in force up to March 31st last should be exceeded.

The Controller of Timber Supplies gives notice to all concerned that in the event of these excessive prices being continued he will have no option but to dispose of Government stocks direct to consumers at prices no higher than the late maximum prices.

No further notice will be given should this action be found necessary.

The Controller requests any firms who are asked for yellow pine prices higher than the late maximum prices to send full particulars to the Assistant Controller Timber Supplies, Branch 5, 80 Newman Street, Oxford Street, London, W.1. The late maximum prices for yellow pine were as follows:—

YELLOW PINE.

(Per standard of 165 cubic feet.)

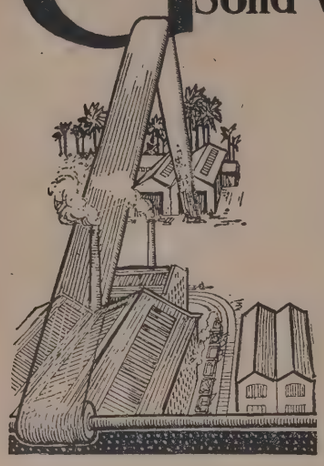
	1st. £ s.	2nd. £ s.	3rd. £ s.	4th. £ s.
3 in. by 12 in. and up	67 0	55 0	50 10	44 0
3 in. by 11 in. and up	64 0	53 0	48 10	44 0
3 in. by 10 in. and up	58 0	48 0	44 0	42 0
3 in. by 9 in. and up	57 0	47 0	43 0	41 0
3 in. by 8 in. and up	55 0	45 0	42 0	39 0
3 in. by 7 in. and up	55 0	45 0	42 0	39 0
3 in. by 6 in. and up	52 0	42 0	40 0	37 0

PIN SIDINGS AT SAME PRICES AS DEALS AND PLANKS.

In case of timber stored by retail yard keepers there is no objection to the above prices being raised by not more than £4 per standard.

The following specific instances of offers made at excessive prices to timber merchants have already been brought to the Controller's notice:—

1. 3rd quality pine at £57 15s. for 3 by 7 by 8 to £66 for 3 by 11. 4th quality pine at £55 12s. 6d. for 3 by 7 by 9 to £59 for 3 by 10. These prices included short railway carriage.
2. 3 by 11 3rd quality, £55, ex quay Liverpool.
3. 3 by 7-10 in. 3rds £53 12s. 6d. free on truck at port.
   3 by 11 3rds £61 17s. 6d.
   3 by 7-10 in. 1st quality £70 2s. 6d.



Board of Trade, June 19th, 1919.

AN AERONAUTICAL INTELLIGENCE BUREAU.

The Aeronautical Intelligence Bureau, Ltd., was incorporated on June 13th. The chief objects are: (A) To unite and combine aeronautical firms for the purposes of mutual advancement and protection. (B) To protect the members of the Society from financial risks by obtaining and distributing information concerning firms undeserving of mercantile credit. (C) To keep a register of bankrupt persons and those in winding up or liquidation. (D) To procure the amendment or repeal of legislation injurious to the members. (E) To procure information as to the standing of firms.

Other points are:—(1) That members are entitled to unlimited investigations. (2) That no member's interests are divulged to another without his written assent. (3) That ordinary letters will take the place of the usual stereotyped inquiry forms. The offices are at 30, Bedford Row, W.C.

GRIPOLY
Solid Woven Belting

"GRIPOLY" Solid Woven Belting is made from Camel Hair Yarns, with a small percentage of cotton and woven by a patent process which insures the greatest possible strength and evenly consistent wear.

"Gripoly" has a triple twisted edge interwoven with the belting which effectively resists fraying caused by guide forks.

"Gripoly" Solid Woven Belting is flexible, non-slipping, stretchless, impervious to heat and moisture and variations of temperature. It is the best all round belting.

Let us know your requirements and we will advise you as to the best type of "GRIPOLY" for your needs.

COMMERCIAL AERONAUTICS & CIVIL AERIAL TRANSPORT

ON ADVISORY COMMITTEES.

By "MEDWAY."

When the time comes for an official return to be made of the products of Great Britain during the year 1919, the list assuredly will, or ought to be, headed by Advisory Committees, of which about two millions have been constituted or are in process of constitution. The Advisory Committee, if not an actual invention of the War, is a device the popularity of which has been established in the past four years. It serves as a means of shuffling official responsibility onto the shoulders of independent experts, whose advice may or may not be taken.

The new Standing Advisory Committee on Civil Aviation appears to be composed of the right type of man. Also, it has an advantage over many such organisations, inasmuch as it is definitely required to advise and report on at least one subject—viz., the best method of organising Imperial Air Routes. For the rest, it shares with similar Committees the privilege of being allowed to advise on those matters submitted to it by the Secretary of State.

The Right Air of Dignity.

There is seldom any difficulty about giving the right air of dignity to an Advisory Committee. It is a compliment to be asked to serve on one, and consequently good names are fairly easily secured. The only trouble is that, of the many Advisory Committees formed during the last year or so, only about one in a hundred manages to get any appreciable quantity of its advice accepted.

The majority of Advisory Committees labour in the dark, and the representatives of various interests upon them report hopefully to those interests that things are going well, and that the Committee bids fair to produce a really intelligent and useful report. Probably in due course it does so. The report is, however, addressed to the Minister as a private document, and as such is not published. The chances are that, in the meanwhile, various political considerations are maturing, as a result of which either the Minister to whom the report has gone ceases to hold office, and is superseded by someone with quite different views, or else the Minister who has received the report finds there are good party reasons for pigeon-holing it and taking no action whatever upon it.

The Disposal Board.

Let us take one or two recent instances, sufficiently near to the aeroplane business to be more or less instructive. We had, for instance, a number of admirable Advisory Committees formed to recommend the course of procedure to be adopted by the Surplus Government Property Disposal Board in respect of the sale of various sorts of Government stores. These Committees gave a lot of time and consideration to their jobs. Each tackled its own particular branch with a reasonable amount of inside knowledge, and honestly tried to work out a scheme which, while good for the taxpayer, was also not injurious to the manufacturing industry concerned. I presume that these reports were handed in, but I am also forced to the conclusion that not one of them was ever taken out of its envelope.

In short, the Disposal Board gave the public the impression that it was going to act upon expert advice. It thus obtained a reasonably good Press and a fair degree of public confidence. The Advisory Committees were mere window-dressing. In the background were the people who had probably decided what they were going to do before the Advisory Committees met, but who knew they would be open to a good deal of criticism if they obviously acted on their own initiative and did not make a show of consulting expert opinion.

The history of the Slough depot is not dissimilar. Roughly speaking, it is a long record of people being asked for advice which was never taken, and which, in fact, nobody ever intended to take. All that was wanted was to be able to say that the advice was being asked, and therefore that everything must be all right. It was only when pressure of public opinion made an inquiry necessary that it really came out that experts had been flouted from first to last. Also, it was only at that stage that Mr. Churchill, speaking for the Government, said quite candidly that the Committee could hold its inquiry, but that the Government did not care in the least at what findings it might arrive, but was going on with its own policy, quite regardless of any interference or opinion—expert or otherwise. It became necessary to admit this, because the nature of the inquiry was bound to be such that a certain number of the facts would become public.

To Make the Official Dish Look Palatable.

The job of the average Advisory Committee is, therefore, to serve as a dressing to make the official dish look palatable. The contents of the dish are settled in advance. The dressing may disguise, but does not alter, its character. It is only when the public get exceptionally excited over some peculiarly stupid exhibition of official ineptitude that it becomes necessary to admit that the process of taking advice was merely formal. By that time it is generally possible to complicate the issue to such an extent that the general public never really finds out what has happened.

The main job of an Advisory Committee is therefore to get terms of reference and powers such that it can, when it chooses, make its reports public, and such that it can advise and report on a good variety of cognate subjects, whether invited to do so or not.

Objections to the Expert.

In the Ways and Communications Bill we see the same tendency of the Government to shield its officials behind powerless Advisory Committees. Directly it is suggested that the Minister *must* ask for advice on certain subjects and that the Committee may make public the nature of the advice that it has given, the Government promptly turns stubborn and is up against the whole principle of the introduction of the expert. The expert is, in fact, only wanted because his name looks well in print, and gives the idea of good democratic control as opposed to bureaucracy.

I am not prepared to say that this new Advisory Com-

mittee on Civil Aviation will be treated as badly as most of its kind. It may become a real power in the land. It may be allowed to do very valuable work, but I suggest that the members of the Committee who are not tied by reason of holding official positions will have to watch things very carefully from the start in order to make sure that they are not being merely used so long as they will endorse a ready-made policy, only to be turned down and carefully silenced if they show the slightest signs to developing a policy of their own.

FRENCH PROGRESS IN CIVILIAN AVIATION
with Particular Reference to Aerial Posts.

Recently, what the French call a "Committee of Action" (which approximates to a sub or working committee in England) submitted a long report on aeronautical problems in general to the President of the Council

The report was arranged under seven headings and is at the moment receiving the attention of the Aeronautical Branch of the War Ministry, personified by Col. Dhé. France just now is well equipped with bureaucratic machinery for studying this subject in all its varied phases; there are in constant session six sets of authorities, each engaged in recording its own particular wishes and resolutions. Tabulated, they are as follows:—

1. Military Aeronautics (under the War Ministry), and its offshoot Civilian Aeronautics, with offices in the Boulevard St. Germain.
2. The Inter-Ministerial Commission on Aviation, of which M. d'Aubigny, Deputy, is president.
3. The Committee of Action formed to develop aviation, and composed of members of the Aviation Commission of the Aero Club de France, delegates from the Chambre Syndicale de Industries Aeronautiques, plus certain Deputies.
4. The commission of delegates from the Inter-Allied Conference, discussing the details of the International Air Code: president, General Duval, in charge of aviation at Foch's headquarters.
5. Research Department of the Ministry of Commerce (Posts and Telegraphs Departments), charged with aerial post problems.
6. The Aeronautical Service of the Ministry of the Marine.

In addition to these, Mr. Chassaing, Deputy, has laid before the Chamber, in the form of a motion, an invitation to the Government to commence organising principal and secondary areo-gares over the whole of France and her colonies.

The seven heads under which the Committee of Action's Report was made are:—

1. The Establishment of Airways.
2. Aerial Postal Services.
3. Aerial Transport Services.
4. The Centralisation of Aeronautical Services, i.e., co-ordinating same.
5. Rules for Regulating Inter-Allied Aerial Navigation.
6. Centralisation of Material (i.e., pooling resources).
7. Organisation and Distribution of Meteorological Services and Intelligence.

MANY COUNSELS LEAD TO CONFUSION.

One sees daily that the presence of many counsels tends to confuse an issue and causes delay. Such is the position here at the moment. Notwithstanding that the Postal Administration was last month in possession of figures relating to buying and hiring prices of material, salaries of personnel, special tax to be imposed on mail and packages, the sinking fund required, and the profits that would eventually accrue, they cannot make up their minds as to whether they ought to run the service themselves as a State affair or whether it should be exploited by a company or companies assisted with a State subsidy.

The Inter-Ministerial Commission and the Civil Aeronautic people are of opinion that it should not be a nationalised transport but that concessions should be given to certain approved companies. In support of their views they note that the Postal Authorities do not possess trains and boats, but hire accommodation, and that they certainly ought not to involve themselves in unknown expenses, also that they ought not to own aircraft of any kind, nor pilots, but that they ought to enter into working arrangements with concessional groups to carry mails, etc., at certain rates.

STATE SERVICE.

The people in favour of State service argue that there is no comparison between aero-mails and those hitherto sent by train and boat and that, if taken up at the beginning, the service will be for the benefit of the State. To which the other side reply, and it must be admitted in good reason, that without a subsidy for mail-carrying the prospective aerial transport companies will not be able to pay their way. The Committee of Action, without committing themselves, have intimated that they think that a reservation of ten per cent. of the useful load carried for postal matter would meet the case to the satisfaction of all concerned. At this point the Maritime League steps in: they are quite willing to be relieved of their obligation in regard to carrying mails—and for a very good reason. Although the State subsidises the Compagnie Transatlantique and the Messagerie Maritime it reserves to itself the right to compel other lines to carry mails when required; thus a ship, having mails, may have to go a long way out of her route to land them, when she has no other business in that direction.

VIEWS ON AERIAL POSTS.

It is an accepted maxim here that aerial posts have no raison d'être unless they can show a great saving in time when in competition with the established means of locomotion, especially is this so when competing with the night mail service during which, it is pointed out, letters are sorted—this, of course, cannot yet be done "en l'air." Further, authorities here still regard with affection the idea of sending the mails from dusk to dawn by train and picking them up by aeroplane in the early morning.

REGULAR AEROPLANE SERVICES.

Week by week I have to note progress made by the aeroplanes engaged in provisioning the Northern and liberated provinces, but their trips are becoming so regular now that I shall soon no more think of chronicling the event than you would the departure of the 8.25 from Finsbury Park to King's Cross. Rather will it be my duty to note the case when any untoward event occurs that results in an interrupted service.

Here is an interesting suggestion as to how an aerial post might be run: the idea, though novel, is not mine, but has come to me from an official quarter, from which one presumes it is receiving due consideration, and stranger things have happened than that this might be the system selected. Qui sait?

At the moment, the only sort of post that Lille receives is by air, and under existing arrangements this will cease when the railways are linked up in through communication and it is possible to use the normal service. It is now proposed to augment the service by a kind of (for want of a better description) "return telegram" service, the telegram being a cross between a letter and a wire, the main idea being to get written replies the same day. Shortly, the scheme is as follows:—

AN AERO-POSTAL SYSTEM.

It is proposed that all such letters shall be enclosed in envelopes of a special hue—blue, for example—they would then be known as the "petits bleu." Certain post-boxes will be disposed in certain quarters of Paris, into which the population will drop their "petits bleu." Each morning at a stated hour a car will collect from these boxes and take the correspondence to a central depot and from there to Villacoublay or any other aerodrome selected. An aeroplane will leave at 12 noon and, ordinarily, arrive at Lille at 2 p.m. From the aerodrome at Lille motor cyclists will distribute the letters. Lille will be provided with post-boxes in various parts of the town into which the "petits bleu" (which may be the replies to the letters received at 2 p.m.) may be dropped. The collection will be made and taken to the aerodrome. The machines will leave at 4 p.m., arrive at 6 p.m., and distribution will be made in Paris during the evening. Of course, by advancing the whole project a couple of hours, one would be able to attend to such replies during the normal hours of business. However, I am but a scribe, and I give you the idea as it was given me.

If the weather makes it impossible for the machines to start, a cyclist will chase around posting notices to that effect on each box. The only point upon which agreement has not yet been reached is that of the tax to be imposed. The State, who fear competition with their telegraphic service, are of opinion that two francs (1s. 8d.) per letter is necessary. Messrs. Bréguet, Blériôt, and Morane (who at present run the provisioning service), on the other hand, think the 60 centimes per letter (about 6d.) would meet the case and that the cost of the voyage does not warrant a greater charge, and they point out further that an aeroplane carrying 50 kilos. of "petits bleu" (how would "letter-grams" do in English?) could also carry 200 to 250 kilos. of small postal packets. A small extra tax on each of these and the State would again benefit.

It seems to me that a service on similar lines would be welcomed between London—Birmingham, London—Manchester, London—Glasgow, etc., or any big manufacturing town, if only because it would enable them to send and receive samples of goods, or obtain signatures to contracts, the same day.

If time flies, so does the aeroplane, and, as time is money, there may be some liaison between the two saws.

In conclusion, the general opinion here is that, apart from the Goliath-type machines, civilian aviation will be developed by means of the aerial postal services.—F. T. M

Pleasant Motoring

The A.A. has won its pre-eminent position as a Road Organisation by reason of its efficient services, the energies of the Association having always been concentrated on giving skilled assistance to its members in any part of Great Britain.

The patrol system—the chief feature of the Association's work—extends over

thousands of miles of main road

so that the khaki-clad A.A. patrol is one of the best known figures on British highways. The duties of the patrols are to give members information of interest concerning the road, warn them of any dangers on the highways and render all possible assistance in case of need.

They are specially selected for their ability to undertake minor roadside repairs and render first aid when necessary.

The patrols report all cases of wilful obstruction and other abuses of the highway likely to lead to accidents, delay, and inconvenience to users of the road.

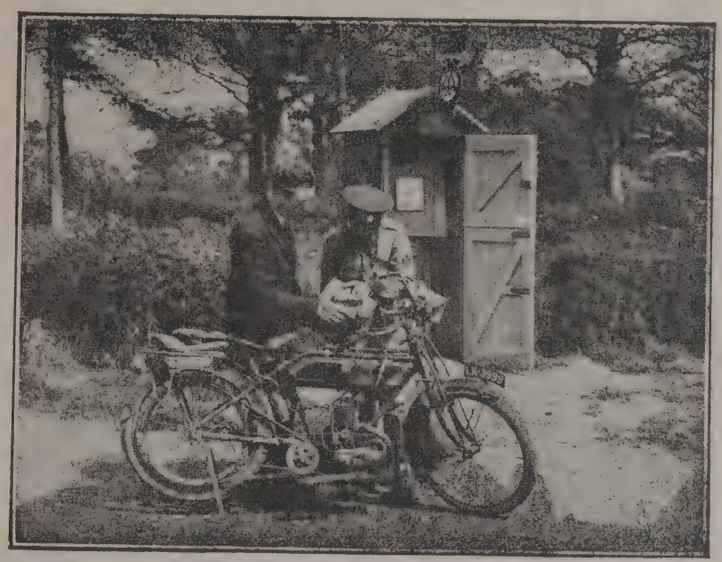
Each patrol is required to know

where the nearest doctor lives, and the nearest A.A. Agent, and in urgent cases at once goes for help.

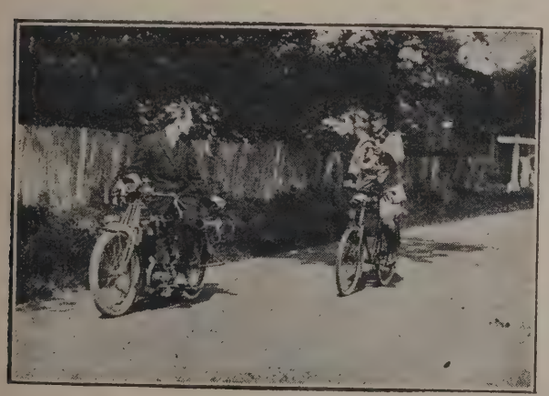
Patrols are acquainted not only with the condition of roads of which they are in charge but with those in the surrounding neighbourhood. They are provided with a map of the district and are familiar with all local features.

They also report any obstruction, unrolled metal, floods, roads "up," and indicate alternate routes to members. The registered number of every car, motor cycle, and cycle car is, as far as possible,

recorded by patrols on their number sheets



on the road, also the time and place at which they pass, and the direction in which travelling. These reports often prove useful in tracing stolen cars or "joy-riders."



All property found on the road by a patrol is sent to the office to which he is attached and full particulars to the London Office. If the article is of any value a full description is given to the local police and advertised in the motoring press.

The patrols report upon all matters likely to affect the relations between

motor cyclists and the general public.

Their reports give the date, time, and place, number of cycle, name and address of owner, names and addresses of all persons present, with any information they are prepared to give, particulars of road, situation, condition, etc.

Patrols are forbidden to ask for gratuities. Nor are they permitted to ask for or receive, directly or indirectly, any sum by way of commission or allowance from the Association's Official Repairers or others, for the introduction of business.

Each patrol is supplied with a packet of telegraph forms for the convenience of members who may wish to send telegrams.

In addition to being entitled to the services of the A.A. patrols in the above connections, members of the Automobile Association

enjoy other privileges,

including Free Legal Defence and Advice, Special Insurance Facilities, Engineering Assistance, the Preparation of Tours (home and abroad), Appointed Repairers and Hotels throughout the United Kingdom, etc.

Every motor cyclist who desires information as to all the privileges enjoyed by members of the Automobile Association should read the booklet, "The Key to the Open Road," a copy of which can be obtained from the Secretary, A.A. & M.U., 41, Fanum House, Whitcomb Street, London, W C.2.

Send a post-card to-day.

CIVIL AERIAL TRANSPORT NOTES.

United Kingdom.

The Crown Prince of Roumania, accompanied by Lady Mainwaring, made his first flight on July 1st in a Handley Page, piloted by Lieut.-Col. Douglas. The machine flew over London at a great height.

WESTON-SUPER-MARE.

Two aerodromes are to be built at Weston-super-Mare, one on the sands. The promoters expect to run a passenger service to Cardiff, Barry and Bristol. There is difficulty in securing a suitable landing ground at Cardiff.

LIVERPOOL.

The formation of a flying club at Birkdale is under consideration. The beach is a fine expanse of hard and level sand, suitable for an aerodrome. The objects would be to enable ex-Service pilots to continue their flying, to organise competitions and to encourage aerial transport. Correspondence should be addressed to Major W. G. McMinnies (late R.A.F.), 18, Gloucester Road, Birkdale, Lancs.

AVRO JOY RIDES.

If an average of 100 people, paying something over £1 each, are flown every day in three Avro machines, one would think that the owners of the machines ought to pay a dividend. The proprietors of the machines, A. V. Roe and Co., Ltd., certainly did during the war, and are now doing their best, to make money out of civil aviation. They have obtained the services of Lieut.-Col. G. L. P. Henderson, M.C., and have put him in charge of the flying, and have started their first passenger-carrying at Hounslow, a good spot, but terribly inaccessible. They have hired a hangar from the Government, who, helping Civil Aviation all they can, charge 5s. for each landing made, and require the engines to be overhauled as soon as they have nicely recovered from the last overhauling.

Major A. G. Taylor, A.F.C. (late R.F.C. and R.A.F.) is in charge at Hounslow, and has four or five ex-R.A.F. pilots as his assistants.

At present there are seven machines in flying order, two 5-seaters, two 3-seaters, a two-seater with dual control, a Baby Avro, and the limousine 3-seater, in which the honeymoon couple recently went down to Cornwall.

Some 250-300 passengers are carried on Saturdays, and on Mondays about 60, which is certainly not bad for the worst day of the week. More than half the ladies want to be stunted, and one of 78 years of age appears at the aerodrome regularly, and says that her health is much better now she has taken up flying—perhaps it is the castor oil.

Business men who wish to go anywhere in a hurry can hire a machine at any time, and tickets for joy-rides may be obtained at all the London theatre agencies.—G. L. D.

The Avro Flight Aerodrome near Manston, Kent, is under the direction of Captain Duncan Davis, A.F.C. (late R.A.F.). Seventy-four passengers, including the Baroness Campbell, were taken up during the week ending July 6th. The Managing Director of John Barker and Co., who is staying in the district, intends to fly to London this week.

The Ladies Mile Aerodrome at Brighton, under the management of Captain D. I. M. Kennard, will be opened on Saturday, July 12th.

The following interesting flights were made during the week ending July 6th:—

On Thursday, July 3rd, representatives from the Palladium flew over London in a five-seater Avro machine, dropping Joy Loan leaflets.

On Saturday, July 5th, a three-seater machine made a cross-country flight to Woburn Sands and return.

Since Thursday, July 3rd, the "Evening Standard" has been delivered daily to Southsea.

The Rev. A. W. R. Little made use of an aeroplane on Sunday, July 6th, in order to fulfil his engagements.

In the morning he preached at the Blackpool Parish Church; in the afternoon he travelled to Blackburn by train and preached there, and directly afterwards he flew back to Blackpool in an Avro, arriving in time to preach at the Peace Thanksgiving Service on the Princess Parade.

India.

The Government is considering a definite project for an aerial mail service between Cairo and Karachi, *via* Baghdad.

France.

M. Henri Deutsch de la Meurthe, President of the Aero Club of France, has given £80,000 to the club for the purpose of organising flying meetings.

Germany.

An advertisement in the "Deutsche Zeitung" states that an air service has been started by the Luft Fahrzeug Ges. m.b. H. from Stralsund to Sassnitz, Binz, Sellin, Gohren and connections with the air line, Berlin-Stralsund of the aviation traffic company, Sablatnig.

The rates for passengers from Stralsund to any of the above seaside resorts is 150 marks; from Berlin to any of the above, 750 marks, and from Berlin to Stralsund 600 marks.

The Hamburg-Amerika Line advertises regular air services, daily, for passengers and freight, between Berlin-Leipzig-Weimar, Berlin-Hanover-Gelsenkirchen, Berlin-Hamburg.

Rumpler Werke A.G. Berlin. In the general meeting held recently a dividend of 15 per cent. was voted, and it was decided to wind up the company. The liquidation will not be done at once, but will take several years. The Board is of opinion that it is impossible to make machines for peace or civilian uses without heavy loss. Directors Rumpler and General Oschmann have been re-elected. Director Aumer of the Bavarian Rumpler Works has been elected liquidator of the company.

According to the "Nieuwe Rotterdamsche Courant" of June 29th, the Hanseatische Flugzeugwerke Karl Caspar A.G. of Hamburg have decided to wind up.

According to the "Hamburg Correspondent" of June 18th, the "Deutsche Luft Rhederei" has introduced a tariff in order to increase the use of the aerial packet. The freight is 5 marks per kilogram (minimum 10 marks with a maximum weight of 10 kg. per parcel). Parcels are accepted every day up to 2 p.m. for that day's journey, starting at 3 p.m., in the office of the Hamburg-Amerika Line, 25, Alsterdam, Hamburg.

According to the "Hamburg Nachrichten" of June 17th, owing to shortage of raw materials the aerial postal services will be discontinued.

Although the first account is the more detailed, it is difficult to say which paper is less given to untruthfulness.

During the Kiel week (regatta) the train service will be relieved by special air lines.

Aeroplanes will be ready in Hamburg to collect travellers coming by air from Berlin, and take them to Kiel. At the same time, from Kiel, aeroplanes will connect with the regular Hamburg-Berlin service. Further, aeroplanes will be available at Kiel for short flights. If successful, the new Kiel-Hamburg service will be maintained.

Holland.

Mr. A. H. Fokker is conducting a series of lectures on the use of the aeroplane for surveying and topographical purposes.

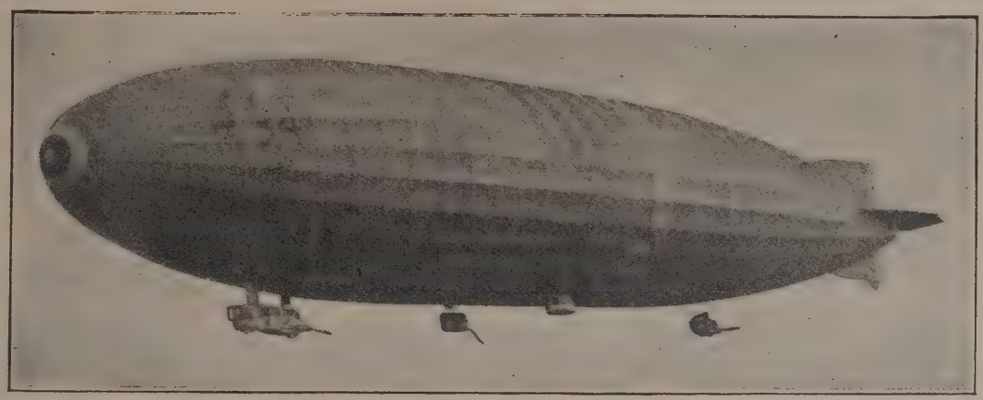
Fokker, who is making great efforts to popularise aviation in Holland, has now decided to run an aeroplane with no motor. This will be trailed in the air by a Fokker machine and will then be released. The builder has secured the services of Serjt. Van der Drift to do this highly risky and needless flight.

From July 1st a passenger and goods service will be undertaken by Fokker, starting from the beach at Scheveningen. Various Dutch authorities have promised their assistance. In the former Scheveningen power house, the aeroplane will find both a repairing shop and shelter. This makes an aerial port of The Hague. On June 27th the chief pilot, van der Drift, brought the first aeroplane from Amsterdam to Scheveningen. This is the first machine for the new service.

In order to examine the possibility of creating a postal Air Service, Amsterdam-Groningen, a hydroplane left Amsterdam on June 17th to fly to Paterwoldscke Meev. The crew was composed of a naval officer and a corporal.

The city of Amsterdam has granted a subsidy of 130,000 guilders to the E.L.T.A. (aeroplane exhibition).

Italy.



The Fiat Company of Turin, Italy, are arranging a non-stop flight from Rome to Kenley, near Croydon, a distance of 1,100 miles, early in July.

The machine, a two-seater biplane, type B.R., fitted with a 650-700-h.p. 12-cylinder engine, is entirely Fiat built. The maximum speed is 160 m.p.h., and it is expected that an average speed of 145 m.p.h. will be attained.

After the arrival in London the machine will continue its flight to Copenhagen, and from thence to Amsterdam for the Aeronautical Exhibition.

Denmark.

The aviation experience of Copenhagen has shown that Denmark is taking a lively interest in the new industry, and that the country will probably be a fine market for all aviation industries. There is no reason to wonder at it since several interested nations have been working Denmark as a prospective client. The Hamburg pilot, Thiele, is trying with Swedish and Danish capital to realise a plan whereby a regular aerial service could be maintained from Copenhagen to Germany. Fifteen Fokker machines are to be sent from Germany for that purpose. With these aeroplanes, each of which can carry four paying passengers,

WAKEFIELD

Castrol

REGD. 'R'

was used exclusively to lubricate the Sunbeam-Coatalen Engines on

R 34

in its Flight across the Atlantic.

CASTROL "R"—"the one oil for all aero engines"—has helped to make history, being used on the Sopwith Rolls-Royce and Vickers-Vimy Rolls-Royce Atlantic flights and also on the D.H.9. Napier Lion engine on making the world's altitude record of 30,500 feet.

An unbroken record of successes on all types of Aeroplanes and Airships.

C. C. WAKEFIELD & CO., LTD.,
WAKEFIELD HOUSE,
CHEAPSIDE, LONDON, E.C.2.

it is expected to establish regular aerial connections all over Denmark.

Further, it is proposed to establish an aviation works near Copenhagen together with a flying school. To realise these plans, all that is needed now, is the official authority. Meanwhile both from the Austrian and the English side there is very lively competition. The Phœnix works in Vienna has sent two of its star flyers, Spermann and Perrini, to Copenhagen, and expects to find a ready market there for these machines.

From the English side Vickers have sent a machine to Copenhagen of the same type as the one which accomplished the trans-Atlantic flight.

The machine is able to carry, besides its crew, 11 to 17 passengers as well as fuel for a 5 hours' journey.

As regards postal or other parcels 2,900 kilos. can be carried. Major Jullerot, of Vickers, Ltd., is expected to examine the possibility of establishing a London-Copenhagen service.

SCANDINAVIA.

A Scandinavian Committee is negotiating with the newly founded Luftfartsrederei in order that Bergen be made a starting point of new aviation routes and, further, in order that an aviation ground and school be established there.

The conference held a few days ago in Christiania, between the Scandinavian accident insurance companies, has decided to syndicate all Scandinavian companies in respect of risks resulting from aviation. Fourteen Danish, four Finnish and four Norwegian companies are joining the syndicate.

SWITZERLAND.

From Interlaken comes the news that an English concern of aerial transporters are engaged in pourparlers with the authorities and the Verkehrsvereine for the hire of an aerodrome on l'Allmenda Unterseen. It is stated that their idea is to start a passenger service between London and Paris, and Interlaken, Lucerne, and Lausanne with super machines carrying thirty to forty persons!

It took Bider exactly 7 hours 28 min. to accomplish the Tour de Suisse. His stages were as follows:—Bale-Geneva, 1 hr. 54 min.; Geneva-Lausanne, 21 min.; Lausanne-Bellinzone, 1 hr. 55 min.; Bellinzone-Ems, 53 min.; Ems-Bale, 2 hrs. 25 min.

It is reported that Lieutenant Bider, who was the first aviator to cross the Alps and the Pyrenees, crashed while flying near Dübendorf, and was killed.

U.S.A.

PREPARING THE WAY.

The following is taken from an American official publication:

In the interest of recruiting and for the purpose of charting, laying out an aerial mail route, and collecting data as to municipal and emergency landing fields a special trans-continental flight will be organised by the Air Service of the Army to leave Hazelhurst Field, L.I., N.Y., on or about July 6th, having as its destination Seattle, Washington.

The tentative route will be across the States of New Jersey, Pennsylvania, Ohio, Indiana, Illinois, Wisconsin, Minnesota, North Dakota, Montana, and Idaho. Stops will be made at Philadelphia, Pittsburg, Columbus, Indianapolis, Chicago, Milwaukee, St. Paul, Minneapolis, Fargo, Bismarck, and other points en route. A distance of some 3,200 miles will be covered.

The aircraft used will consist of four Curtiss J.N.4H. planes, and Type R. Obs. balloon.

The feature of the trip will be the observation balloon demonstration. This will be transported on trucks and inflated at several of the places where stops are made. The observation balloon will be the type R. used on the front.

The motor transport equipment will consist of a complete machine shop with all the repairing machinery necessary carried on trucks and lorries.

Special attention will be given to photography so that when the trip is finished no data will be lacking for the laying-out of a perfect aerial lane from New York to Seattle.

The personnel of the party has not yet been decided, but it will consist of 16 officers and 36 enlisted men.

Eighteen to 20 weeks' time will be devoted to the work, and the results will determine the route of the return trip.

PROGRAMMES, PEACE, AND PYLONS.

No one could call the Hendon Peace Meeting, which occurred on Saturday, July 5th, a big event or a success. It was lucky for the public that it was not advertised more, for had it been perhaps more than the few hundreds of people who did go to see it would have been disappointed.

Outside the entrance gates one was set upon by small boys demanding threepence for a souvenir programme, the souvenir part of it consisting of a sparkling account of the Aerial Derby, surely a little stale now. With the programme a sixpenny copy of the Hawker-Grieve souvenir is thrown in, slightly older still, but apparently given to afford some reading matter during the long waits during the heats of the race.

The following is the list of pilots and machines flying in the speed handicap according to the souvenir programme:—

1. Lieut. C. Turner, A.F.C. B.A.T. "Bantam" (170-h.p. A.B.C. "Wasp").
2. Capt. P. R. T. Chamberlayne. Grahame-White "Bantam." (80-h.p. Le Rhône).
4. Lieut. R. S. Park, A.F.C. Avro (110-h.p. Le Rhône).
5. Major R. H. Carr, A.F.C., D.C.M. Grahame-White "Bantam" (80-h.p. Le Rhône).
12. Major C. H. C. Smith, D.S.C. Bristol monoplane (80-h.p. Le Rhône).
14. Lieut.-Col. G. L. P. Henderson, A.F.C., M.C. Avro "Baby" (35/40-h.p. Green).
19. Capt. D. H. Robertson, A.F.C. Avro (110-h.p. Le Rhône).
20. Capt. G. R. Hicks, D.F.C. Avro (110-h.p. Le Rhône).
21 Capt. G. Gathergood, A.F.C. Airco "D.H. VI." (90-h.p. R.A.F.)

On glancing down it one is struck by the fact that there is only one racing machine mentioned, the B.A.T. "Bantam," and that machine did not perform, neither did the Bristol monoplane, so it was impossible for the race to be extraordinarily thrilling.

According to the souvenir programme again, the Hendon Peace Meeting was at 3.30 p.m., and the speed handicap over the aerodrome pylon course at 4 p.m. What was one expected to do between 3.30 and 4—rejoice a little? Except listening to the band or watching the carroty Avros taking up passengers there was nothing else to do, with the exception of getting wet, which was very easy, and getting wet *externally* does not go well with rejoicing.

Eventually four machines lined up with their tails towards the audience: Gathergood on the D.H.6, Park on his Avro, Robertson on a carrot Avro, and Chamberlayne on the G.W. monoplane. The D.H.6 was given 19 seconds' handicap allowance, and the Avros 13 seconds. Before starting the pilots were muddled as much as possible by contradictory rules of the race given by the various officials—strange people.

The D.H.6 went off first, and the Avros having the same handicap were started after 10 sec. interval. Park, in the first Avro, caused a little excitement by sweeping the ground with his right wing tip when taking off. They went round the pylons four times, all flying as close to the ground as possible, the G.W. passing the two Avros and coming in second.

The second heat occurred some time afterwards. Lieut.-Col. Henderson, on the "Baby" Avro, having 19 seconds' start of Hicks and Carr, both on Avros, was passed by them easily.

Then the rain came down in earnest, and there was a rush for the pavilion, and many wished to obtain tea, but the waitresses were insufficient. The rain delayed the final till six o'clock, and no entertainment was provided. Lieut.-Col. Henderson and Lieut. Park wisely departed before the final event.

In the final, Capt. Gathergood, D.H.6, was given 28 secs. handicap allowance, Carr and Hicks, on Avros, 19 secs., and Chamberlayne on the G.W. monoplane was scratch. In the second of the six laps Capt. Gathergood had to land owing to engine trouble, and Capt. Chamberlayne, passing the Avros, came in first, winning the race.

Capt. Chamberlayne went up again after the race, and after doing some stunting struck a hangar support and crashed, but was not seriously hurt.

In the long intervals between the heats no entertainment was provided, no professors did parachute descents, nor did anyone stunt. Perhaps it was intentional, so as to draw attention to Mr. Grahame-White's land-yacht, which ambled slowly up and down the asphalt path. It was very slow.—G. L. D.

THE HENDON SUMMER MEETING.

A 20-mile cross-country handicap for the Hendon Trophy and £30, will be held at the London Aerodrome, Hendon, at the Summer Meeting, on Saturday afternoon next, July 12th, at 4 p.m.

The course, of which five laps must be flown, is round the aerodrome pylons and a point about two miles out, i.e., Bittacy Hill—a distance of approximately four miles.

It is expected that the pilots will include Mr. C. B. Prodger, Major C. Draper, and Mr. C. Turner on B.A.T. machines; Mr. Chamberlayne, Major Carr, Messrs. Hicks and Robertson on Grahame-White biplanes; Mr. Park and Mr. Hammersley on Avro biplanes, the latter flying the Avro "Baby"; Capt. Gathergood and Mr. Manton on Airco biplanes; and Major Smith on a Bristol monoplane.

Entries close at 12 noon on Thursday next, the 10th inst.

At intervals during the day, Special Flying Displays and Passenger Flights will be carried out, and these will be repeated on the following day.

Additional enclosure accommodation has now been provided, and admission to the aerodrome is now from 9d., plus tax. Children half price.

Special Flying Displays will be given on the following afternoon, Sunday.

"CIVIATORY."

It is notified by the Air Ministry for information that "Civiatory" has been registered as the telegraphic address of the Civil Aviation Department, Air Ministry, India House, Kingsway.

Historic Peace Message

Brought to H.M. The King by Airco 4a.

THE aeroplane which brought the historic Peace message on Saturday June 28th from Mr. Lloyd George to the King was one of the famous Airco 4A machines with a Rolls-Royce Motor.

This machine has constantly been selected by the authorities for conveying urgent messages between London and the Peace Conference, while Mr. Bonar Law, General Seely, and other Ministers of State have made numerous journeys in it.

The Airco 4A makes the 250 miles flight from Paris to London in an average time of 2¼ hours, and it is the sheer speed of this machine which renders it an indispensable means of communication between the two Capitals.

AIRCRAFT DISPOSAL DEPARTMENT.

FOR SALE.

FLYING BOATS.

Lot. S.B.5/15. 38 Flying Boats, H.16 secondhand, the property of the U.S.A. and now lying at Killingholme Air Station, near the mouth of the Humber—These Flying Boats are minus engines.

BALLOONS.

Lot. S.B.5/15. Standard type—42 American Type Kite Balloons. New and complete with all Spares, packed in crates ready for transport.
15 ditto requiring re-cording. Stored at No. 5. R.A.F. Stores Depot, Earls Court, S.W.

As Secondhand Fabric Only.

,, 273 Balloons of various types, condemned for defects. Average weight, 6 cwt. each. Above are stored at No. 5. R.A.F. Stores Depot, Earls Court, S.W.

CANVAS (Secondhand).

,, Canvas secondhand--In fair condition about 20 tons repairable Covers, Walls and Curtains, etc., for Aircraft Hangars—Packed in bales ready for transport—suitable for use as Tarpaulins. Stored at Midland Railway Granary Stores, St. Pancras.

AIRSHIP GASBAG MATERIAL (Secondhand).

Lot. S.B.5/15. Rubber proofed Cotton Fabric lined with Goldbeater's skin—quantity about 7,000 square yards—weight about 2½ tons, now lying at R.N. Store Depot, White City, W.12.

BALL BEARINGS.

Lot. S B.6/16. Hoffman, Skefko, Volvo, R.B.F., S.R.O., M.A.B. and other makes, about 6,900 in various sizes.

Tenders are requested for any or all of the above, and permits to view and all particulars and forms may be obtained from :—

The Controller, Aircraft Disposal Department, Kingsway, W.C.

Tenders are returnable by July 21st, 1919.

For Detailed List of all Surplus Government Property for Sale apply at the nearest Bookstall for "Surplus," Price 3d., the official organ of the Surplus Government Property Disposal Board.

AIRCRAFT FINANCE

THE POSSIBILITIES OF A REGISTRY.

There is some inspiration to be derived from the appointment of the Standing Advisory Committee on Civil Aviation. This inspiration springs not so much from the specified objective of the Committee, but rather from the personality and qualifications of the Committee itself.

NAMES TO CONJURE WITH.

First of all there is Lord Inchcape of the P. and O., who is pre-eminent in the shipping industry and has a very considerable and an active interest in other things, including banking. Then there is also the Chairman of Lloyd's (Mr. Charles Irving de Rougemont). The combination of these two authorities may result in appreciable benefits to the aviation industry. The remainder of the Committee are excellent in their particular spheres, but one is inclined to attach more significance to the conjunction of the leader of shipping and the head of Lloyd's.

PATIENCE WILL BE REWARDED SOON.

In the opinion of some people the question of a Registry of Aircraft and also of Pilots and Navigators generally, on the lines of Lloyd's Shipping Register, is not advancing so promisingly as one would wish in the interests of aviation and the immediate future of the industry.

This is a pity. Perhaps some people, however, are inclined to be just a little impetuous, forgetting not only the natural obstacles inseparable from the creation of a new scheme, but also the fact that aviation, as a commercial proposition, has not yet reached puberty.

ESSENTIAL FACILITIES.

When everything is taken into consideration, the impatience is justifiable. No one can deny that a Register of Aircraft and of Navigators, on similar lines to Lloyd's system in connection with shipping, is positively essential for the proper and efficient development of commercial aeronautics. The matter was fully discussed herein a few months ago, and was considered premature in several quarters.

A START IS NEEDFUL.

In taking the parallel of shipping one must confess that the Registry grew up with the progress of that particular industry, and only attained its present perfection by years of strenuous work and unremitting care. Likewise must the Aircraft Registry grow. It is, as a matter of fact, growing coincidently with the increase in insurance facilities and the expansion in that business.

CENTRALISATION IMPERATIVE.

But it is not growing on centralised lines. On the contrary, each Office necessarily considers that the knowledge collated through its individual experience of aviation insurance is its own private property and is not for the benefit of any competing Office. This attitude is quite justified. But it is obvious that development on such lines necessarily vitiates the general utility of the scheme.

There must be centralisation to begin with, and the principles laid down for the standardisation of aircraft must be determined by a representative and competent body of experts fully conversant with all that pertains to practical aeronautics and aircraft construction. Without such a representative body there will be the idiosyncrasies of faddists and the disabilities of incompetents to fight against.

THE INITIAL EXPENDITURE IS AN OBSTACLE.

The initial cost of the elaboration of such a scheme is an obstacle of some difficulty. Frankly, in the course of time a Registry must come. It will grow concurrently with the development of commercial aviation, but in a case like this it would be better to anticipate events with a view to accelerating progress rather than allow matters to drift along normally.

THE PARALLEL OF SHIPPING.

In these circumstances it would appear to be the soundest policy for the State to take a participating interest in the elaboration of the scheme. The State has enacted certain regulations with the object of safeguarding the public. It is but a small step to collaborate with the pioneers of commercial aviation, and for the State to enlarge its interest so as to enable the industry to start its career with some degree of standardisation.

The benefits would be reciprocal. The cost of the pioneering, if divided between the State and the industry (through the agency of the insurance world) would be whittled down appreciably.

Those who are impatient at the absence of any definite development on these lines may take heart from the appointment of the Committee. Already there exists a scheme of registration for navigators. The State, through the medium of the Board of Trade, puts the hall-mark of efficiency in navigation and seamanship on mariners. Similarly Lloyd's acts as a sort of deputy for the State in branding ships. It is up to the State to do likewise with the next industry, commercial aviation.

W. J. DAVIES.

CURRENT TOPICS.

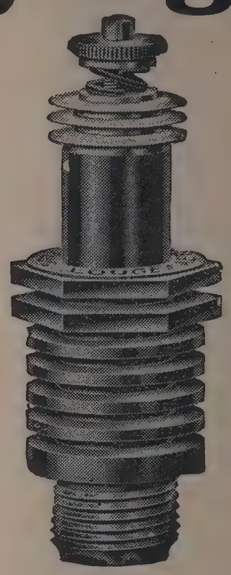
PROPOSED WHITEHEAD AIRCRAFT LIQUIDATION.

The affairs of the Whitehead Aircraft (1917) seem to be developing rapidly. A voluntary liquidation is now proposed. With this object in view an extraordinary meeting is called for the 11th at Cannon Street Hotel, E.C. The resolution to be submitted is: "That the company be wound up voluntarily, and that Oliver Sunderland, of 15, Eastcheap, accountant, and chairman of the Creditors' Committee, and Charles Furley Oldham, of Feltham, representing the shareholders, be and they are hereby appointed liquidators for the purpose of winding up."

Should the resolution be passed by the requisite majority, it will be submitted as a special resolution to a second extraordinary meeting to be subsequently convened. But why voluntary liquidation?

NEW COMPANIES.

BISHOP-BARKER AVIATION CO., LTD. Private company. Registered May 31st. Capital, £10,000 in £1 shares (5,000 participating preference). To carry on in the United Kingdom, the U.S.A., France, Canada, and elsewhere, the business of carriers by air, flying school owners, proprietors and compilers of registered aircraft, aerial cinematographers, manufacturers of aircraft and spare parts, etc. The subscribers (each with one preference share) are:—J. F. Seacombe, 18, Finch Lane, E.C.3, clerk; H. J. Gay, 18, Finch Lane, E.C.3, clerk. First directors: Lt.-Col. W. A. Bishop, V.C., etc., Lt.-Col. W. G. Barker, V.C., etc., and Capt. R. L. Lott. Solicitors: Simmons and Simmons, 18, Finch Lane, E.C.



AVIATION TRANSPORT INTERNATIONALE, LTD. Private company. Registered June 5th. Capital, £1,000 in £1 shares. Manufacturers of and dealers in aircraft (including flying boats), operators of postal, passenger and freight services in the United Kingdom and elsewhere, etc. The subscribers (each with one ordinary share) are:—T. F. Cowan, 15, Duke Street, Adelphi, W.C. aero engineer; J. G. Freeman, 18, Eldon Street, E.C., solicitor. T. F. Cowan is permanent governing director. Registered office: 15, Duke Street, Adelphi, W.C.

Commercial Flying

"The success of Commercial Flying depends amongst other things upon the security it affords."

¶ Security is afforded by the equipment of a machine with reliable fittings.

¶ The selection of reliable sparking plugs was a point recognised as highly important by those responsible for the equipment of war service machines—*reliability counted then*—and for that reason the plugs used more than any other aircraft plugs were the

NAVAL.

ADMIRALTY APPOINTMENTS.

The following appointments have been made :—

July 1st.—Art. Engr.—F. W. M. May, to "Vindictive," June 20th.

* * *

It was reported from Kem on June 30th that British seaplanes operating with the Royal Navy had bombed the Bolshevik positions. Damage was done to various buildings and a train was destroyed. Two of the seaplanes were shot down by machine gun-fire, but the crew contrived to reach the British lines. There were no casualties.

During the end of June or the beginning of July the Naval seaplanes took part in an action on Lake Onega, and succeeded in sinking a Bolshevik paddle steamer which was conveying troops.

* * *

It was stated in the Press on July 5th that a detachment of the Royal Navy will take part in the Peace Celebrations at Southend on July 19th. A Flying Squadron will be included in the detachment.

MILITARY.

FROM THE "LONDON GAZETTE."

WAR OFFICE, July 2nd.

REGULAR FORCES.—ROYAL REGIMENT OF ARTILLERY.—R.H. and R.F.A.—Maj. V. A. H. Taylor to be secd. for service with the R.A.F., Aug. 22nd, 1918.

WAR OFFICE COMMUNIQUÉ.

The War Office made the following announcement on July 2nd :—

MURMANSK.—Our seaplanes have bombed the station of Kyapeselga, 15 miles south of Medvyega Gora, and secured a direct hit with a heavy bomb on a moving train. A portion of the train was demolished, and the engine is reported as lying in a crater. Enemy A.A. guns and machine-guns have been very active against our planes, several of which have been hit. One machine brought down by machine-gun fire crashed in the forest, both pilot and observer found their way back to camp.

The R.A.F. have done splendid work, both along the railway and against the enemy's flotilla. After an attack by bombs and machine-guns one of the enemy vessels ran ashore. Successful bombing by seaplanes and also observation of gunfire has been rendered very difficult by forest fires.

The following casualty was announced on July 2nd :—

CANADIAN FORCES.—WOUNDED.—Neil, Lt. D., Can. For. Corps, attd. R.A.F.

* * *

A message dated June 15th states that during the recent fighting to relieve Jandola, Afghanistan, aeroplanes were used to assist in the dispersal of the tribesmen.

* * *

It is now reported by Bolshevist wireless that the two British aviators taken prisoners in the Astrakhan district are Col. Van der Spuy and Mr. Ingram (rank unknown). They have been taken to Moscow. A third aviator was killed while attempting to escape.

AIR FORCE.

FROM THE "LONDON GAZETTE."

AIR MINISTRY, July 1st.

R.A.F.—The following temp. appts. are made at the Air Ministry :—Staff Officer, 2nd Class (P.).—Paymr. Lt.-Comdr. H. L. Jackson (R.N.), Feb. 13th, and is granted a temp.-commn. as Maj. (T.).—Lt. J. G. N. Clift, April 1st, 1918, to Sept. 1st, 1918, and to be actg. Maj. whilst so empld.

Staff Officer, 3rd Class (T.) —Lt. (actg. Maj.) J. G. N. Clift, Sept. 2nd, 1918, from S.O., 2nd Class, relinquishing the actg. rank of Maj., and to be actg. Capt. till April 30th.

The following temp. appt. is made :—Staff Officer, 3rd Class (P.) —Capt. R. R. L. Thom, June 1st.

FLYING BRANCH.—Maj. R. B Ward to be actg. Lt.-Col. whilst empld. as Lt.-Col. (A. and S.), June 16th.

Capt. L. P Paine, D.S.C., to be graded for purposes of pay and allces. of Capt. (S.), and to be actg. Maj., without the pay and allces. of that rank, March 25th.

The notification in "Gazette," March 7th, concerning Sec. Lt. (acta Capt.) W. Lienard, M.B.E., is cancelled.

Sec. Lt. C. W. Kerr to take rank and prec as if his appt. as Sec. Lt. bore date March 22nd, 1918.

The notification in "Gazette," June 6th, concerning 184268 Cadet P. H. Mellet is cancelled.

* * *

The Air Ministry made the following announcement on July 7th:

The Air Council invites applications from duly qualified men for appointment as Commissioned Dental Officers at a salary of one pound per diem, together with a war bonus of 28s. per week, and certain allowances where quarters are not available. Successful applicants will be required to engage under contract for 12 months or until their services can be dispensed with, whichever will happen first, and will be granted an outfit allowance of thirty pounds.

Applications should be made to the Secretary, Medical Department, Air Ministry, London.

* * *

The Home Secretary stated on July 4th that the W.R.A.F. will not be disbanded, as this corps is able to perform duties for which women are better suited than men.

* * *

The London "Evening News" understands that Salisbury Plain has been selected as the peace-time central training depot of the Royal Air Force. The various establishments in different parts of the country are being transferred there as rapidly as possible.

It is believed that only 400 permanent commissions in the R.A.F. will be granted, but about 3,000 officers will be offered commissions for a period of four years.

[This should be taken for what it is worth. It has not, so far, been officially confirmed.—Ed.]

* * *

On July 4th, Lieut. King, R.A.F., met with an accident while flying at Brooklands. His machine, in falling, narrowly missed some cottages and struck a tree, near Plough Bridge, Byfleet. Mr. King was taken to the hospital suffering from bruises.

* * *

The following are the competition results of Royal Naval, Military, and Air Force Tournament:—

July 2nd.—Wheel Changing and Driving Competition by Women Motor Drivers.—1, Women's Legion, marks 21¾, time of wheel changing, 70 secs.; 2, Women's Royal Air Force, marks 20½, time of wheel changing, 85 secs.

Wheel Changing and Driving Competition by Women Drivers.—The Women's Legion and the Voluntary Aid Detachment tied for first place with 22 marks each. The Women's Royal Air Force was second with 21½ marks.

July 3rd.—Wheel Changing and Driving Competition by Women Motor Drivers.—Women's Legion, 20½ marks (time in wheel-changing, 75 secs.), 1; V.A.D. (General Service Section), 20 marks (time, 78 secs.), 2; Women's R.A.F., 18 marks (time, 90 secs.), 3; Women's R.N.S., 16 marks (time, 94 secs.), 4; Q.M.A.A.C., 14 marks (time, 118 secs.), 5.

July 4th.—Wheel Changing and Driving Competition by Women Motor Drivers.—Q.M.A.A.C., 18¾ marks, time of changing, 89 2-5 secs., 1; Women's Legion and W.R.A.F., tied for second place with 17¾ marks, time 87 secs.

July 5th.—Wheel Changing and Driving Competition by Women Motor Drivers.—Q.M.A.A.C., 21 marks, time in wheel changing, 80 1-5 sec., 1st; Women's Legion, 21 marks, time in wheel changing, 74 sec., 2nd; W.R.A.F., 20 marks, time in wheel changing, 75 3-5 sec., 3rd; V.A.D. (General Service Section), 19 marks, time in wheel changing, 83 sec, 4th; W.R.N.S., 13¾ marks, time in wheel changing, 101 sec., 5th.

W.R.N.S. and W.R.A.F., 22 marks each, tied for first place; Q.M.A.A.C. and Women's Legion, 21¾ marks each, tied for 2nd place; V.A.D. (General Service Section), 3rd.

The final of the teams is: Women's Legion, total, 165¾ marks, 1st; W.R.A.F., 163 marks, 2nd; Q.M.A.A.C., 158 marks, 3rd; V.A.D. (G.S. Section), 152¾ marks, 4th; W.R.N.S., 142¾ marks, 5th.

Tug of War (130 stone) by Navy, Army, and Air Force Teams: No. 5 Stores Depot R.A.F. (Earl's Court) beat H.M.S. "Erebus" (Sheerness) by two pulls to nil.

July 7th.—Women's Motor Driving and Wheel Changing Competition.—1, Women's Legion Motor Drivers (Miss S. Egan, Miss G. Garden), 165¾ points, fastest time wheel changing, 74 seconds, by Miss Egan; 2, Women's Royal Air Force (Miss H. Cross, Miss H. Wight), 163 points, fastest time wheel changing, 75 3-5 seconds, by Miss Cross.

FRANCE.

The "Petit Journal" of July 3rd confirms the report that the Government has decided to appoint Aeronautical Attachés to the French Embassies and Legations in Allied and Associated countries.

The first Aeronautical Attaché to Washington is Captain Guy de Lavergne.

The following has been received from our Paris correspondent:

Nungesser, back again in Paris from a little trip to London, is spreading his delight to all his French comrades, anent the maniability of the Bat people's "Bantam," which he flew whilst in England and with which he was extraordinarily delighted. He said it could be handled more easily than any of the 120 different types of machines he had previously flown, and if war broke out again he could think of nothing more amusing than to fly a "Bantam" and get a roving commission from the French Government to go up and down the lines on his own account killing Huns. He reckons that with the Bantam he could collect Huns at twice his pre-Armistice speed.

Contrary to expectation, it is now established that Garros was not killed by a German bullet, but was the victim of his own inventive and perfective instinct. In order to obtain a quicker rate of fire from his guns firing through the airscrew he had made several modifications to his machine. At the moment that he attacked a Boche, nosediving with the motor full on, the synchronisation of the speed of fire and of the airscrew became defective. The propeller was splintered badly, setting up such vibration that the machine broke in the air.—F. T. N.

GERMANY.

A wire from Bremerhavn, dated June 26th, states that on the night of Wednesday, June 25th, at about 12 o'clock, an airship was visible which came from the sea taking a course for Bremerhavn, Geestemunde, and returned to the sea again. For a certain time searchlights were playing from the airship, and the mark H.C.34 could be read on the sides of the vessel.

In other seaside resorts the same kind of visitor has been noticed. Immediately afterwards the H.Q. of the Marine station of the North Sea issued an order whereby every photograph of any such airship is to be sent in at once to Headquarters. It is thought that the airship was English.

HOLLAND.

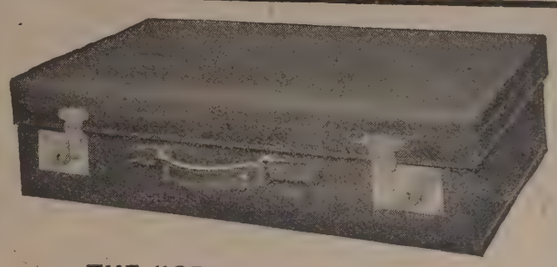
The Dutch Colonial Office has bought 24 aeroplanes from Great Britain with accessory reserve motors and spare parts.

The machines are intended for use in the East Indies. They are of two types; D.H.9 fighting aeroplanes and Avro machines for training.

U.S.A.

In a eulogy on the American Navy, which was published in the "Times American Supplement" on July 5th, the following appeared:—

In the air the American Navy grew from 50 seaplanes in July, 1917, to 100 seaplanes in the middle of 1918, taking no account of 324 seaplanes used for training. Much coastal patrolling in England, Ireland, and France was done by the United States Naval Air Forces.



* * *

On July 1st five persons were killed at the Naval Airship Camp, near Baltimore, by the explosion of an airship. The ship had

A social and sporting club, formed to promote and encourage flying and aerial travel of all descriptions, the "London Flying Club" will be in every way a Club de luxe and, located as it is at the hub of British aeronautics, the recognised social centre of the Flying World.

It combines the conveniences of a Town Club and a luxurious Country Club, possesses a private Aerodrome, and garage en tout cas, tennis courts, ballroom, theatre, dining room, card room, library, luxurious lounge, and American Bar; a large number of bedrooms (hot and cold water and telephones), dressing-rooms, baths, barber's shop, and all modern appointments. The whole club is centrally heated

In addition to flying, the Club will offer many other attractions in the way of sports, games, Thé dansants, etc. A particular feature for the present summer season is a Hawaiian Band, specially brought over from America for the exclusive use of the Club.

The Club will be justly famed for its choice catering, which will be under the management of the well-known Restaurateur, Cavre. R. Nobile, late of Claridge's and the Hotel de la Plage, Ostend.

A number of Motor-cars are owned by the Club and are kept exclusively at the call of members by telephone for use between Town and the Club at a moderate charge.

The London Headquarters of the Club are at the Ritz Hotel where Club Cars will attend every day at stated hours.

Ladies and Gentlemen are eligible for membership, which carries outside advantages allied to the Club.

For full particulars and application for membership, apply to

THE SECRETARY,
London Flying Club, Hendon, N.W.9

NOW READY. **2s. 6d. NET.**

PLAIN IMPRESSIONS

By A. S. G. BUTLER.

With an Introduction by C. G. GREY, who says:

"The writer of this book is an architect by profession and was an artillery officer through the incidence of war. Those who have had the privilege of serving the King in the field will recognise the deadly accuracy of the brief sketches which form this little book, and those who have not had that honour may gather from them an idea of active service somewhat different from that conveyed by the more highly coloured pictures of professional artists in words."

THE AEROPLANE & GENERAL PUBLISHING CO., LTD.,
61, CAREY STREET, W.C.2.

descended owing to trouble with its steering gear, and a large crowd had surrounded it when it exploded.

* * *

The following regulations as to flying in the U.S. Air Service have been issued by the office of the Direction of Air Service, War Department, U.S.A. :—

I. 1. Flights in aircraft under the control of the Air Service are authorised for all training or war purposes and such other purposes as are set forth below :—

(a) For the proper execution of any approved project of the Air Service or of the Air Service in co-operation with any other branch of the Service or department of the Government—special approval of this office to be secured in each case.

(b) For the demonstration of aircraft and aircraft development to officers of the Executive, legislative, and judicial branches of the Government.

(c) For the rapid transportation of military or civilian officials of the Government, of messages or parcels in cases of urgent necessity and for the convenience of the Government.

(d) For the assistance of stranded civilian aviators or where it is necessary for the saving of human life.

2. The following may be carried as passengers in aircraft under the control of the Air Service :—

(a) Any person necessary to be carried as a passenger to accomplish the purpose of any of the flights authorised in paragraph No. 1, above.

(b) Officers and enlisted men of the Army, Navy, and Marine Corps, both active and reserve.

(c) Officers and enlisted men of foreign armies, as a courtesy when they are visiting the United States.

3. No person will be permitted to pilot aircraft under the control of the Air Service except regularly authorised Air Service pilots or bona fide student-pilots of the Air Service.

II. 1. Persons operating aircraft who are not in the military service or who are not under the jurisdiction of the Air Service will be permitted to use Government facilities at Air Service stations contingent upon their proper observance of the air and ground rules in force at the particular station in question, and subject to the discretion of the Commanding Officer thereof as not interfering with the proper conduct of official business of his station, as follows :—

(a) They may be permitted to land and take off from flying fields.

(b) They may be permitted to place airplanes in Government hangars overnight or for a short time pending repairs.

2. The sale of gasoline, oil, spare parts, etc., or the furnishing of the labour of Air Service mechanics in any form to pilots not in the military service is forbidden.

* * *

An official U.S. Army message from Washington, D.C., dated June 16th, 1919, says that upon the heels of the instructions of the War Department to treble the Air Force on the Mexican border the Director of Air Service late this afternoon issued orders to send three flights of six planes each to Fort Bliss. These flights will probably not be formed into a squadron on account of the large area to be patrolled, as it will require separate bases for operation. These flights were ordered to move from Kelly Field (San Antonio) and Ellington Field (Houston), Texas, at the earliest possible moment. These squadrons will be equipped with De Havilland Liberty planes.

At first a flight of only six planes was ordered, but the General Staff considered the situation of such import to warrant the increase of the Forces, and late this afternoon the necessary telegraphic instructions were issued. The general opinion around the Air Service headquarters yesterday was that the work required would be that of an observation squadron, and that the better plan on account of the rapid demobilisation in the United States and the need of thoroughly trained personnel was to send an arriving overseas squadron immediately, and then relieve it as soon as competent personnel could be mustered from the training schools throughout the United States.

It developed that the Twelfth Aero Squadron, the most famous corps observation squadron in France, and one which formed the first observation group at the Front would arrive at New York to-morrow afternoon from Brest. Brigadier-General William Mitchell, Chief of Training and Operations of the Air Service, requested orders last night from Major-General Charles T. Mencher, Director of Air Service to have the Twelfth Aero Squadron ordered intact upon arrival to El Paso, Texas, and placed at the disposition of the General commanding the United States Forces in Mexico.

As expressed last night by Major E. R. Haslett, assistant to Brigadier-General Mitchell, the object of the contemplated rapid movement of this famous oversea squadron to the border was to take over the operation of the aeroplanes which would be flown from Houston and San Antonio, Texas, and when competent personnel could be gathered in the United States the Twelfth Aero Squadron would be relieved in case the situation did not become too serious.

The Twelfth is in such splendid state of organisation that they can operate immediately, and the personnel is thoroughly experienced, having served throughout the Chateau Thierry, Saint Mihiel and Argonne offensives.

There was much speculation at Air Service headquarters last night as to who would command the new Air Expedition. The Chief of Operations, Lieut.-Col. L. H. Brereton, who was the first Commanding Officer of the Twelfth at the Front, and Major Elmer R. Haslett, who was the Chief Observer of the squadron at the Front, both formally volunteered their services last night for the expedition, and it was considered probable by many that Colonel Brereton would be designated to command the new expedition, and Major Haslett would be designated as Chief Observer and second in command on account of the wide experience of these officers at the Front.

There was some talk that if the situation developed Brigadier-General William Mitchell, who commanded the Air Service at the Front would personally assume command. Major Reed M. Chambers, an American ace, now commanding the Ninety-fourth Aero Squadron, which was the old squadron of Rickenbacker, was in Washington yesterday, and made application to be assigned to the expedition in any capacity should it be necessary to utilise the services of a pursuit aviator. At present, however, it is believed that it will only be necessary to use observation planes which can also be used for firing on the infantry on the ground.

AFGHANISTAN.

The following story, dated June 19th, appeared in the "Times," and, one thinks, the "Times" should have the credit therefor :—

The rumours that four aeroplanes had arrived at Kabul for the Afghans originated in the fact that, in order to reassure the frightened population, the Ameer caused four dummy aeroplanes to be secretly constructed. The people were so much alarmed by our planes that they insisted that Amanulla should procure some. Unaware of the fraud practised on them, they are now being regaled with wonderful stories of imaginary exploits of Afghan airmen.

PERSONAL NOTICES.

NAVAL.

ENGAGEMENT.

TRAVERS—FRASER.—A marriage is arranged between Major Herbert Gardner Travers, D.S.C., R.A.F., second son of Mr. and Mrs. J. L. Travers, of Horton, Warlingham, Surrey, and Hermia Edith Margaretta, younger daughter of Lieut.-Col. E. A. Fraser and Mrs. Fraser, of Bodicote Lodge, Banbury.

MARRIAGE.

DONALD—STACY.—On June 30th, at St. Bartholomew-the-Great, London, E.C., Capt. Graham Donald, D.F.C. (late Flt.-Cmdr., R.N.), elder son of the late Capt. D. P. Donald, of Johnstone, Renfrewshire, Scotland, was married by special licence to Claira Sylvia, third daughter of Lt.-Col. J. H. Stacy, T.D., R.A.M.C. (T.), of Great Yarmouth (late of Norwich).

MILITARY.

DEATH.

LYSTER-SMYTHE.—Captain and Flt.-Commdr. Richard Litton Lyster-Smythe, R.A.F., formerly Lieut. 3rd Gordon Highlanders, was drowned while bathing at Jaffa on June 19th. He was the youngest son of Col. and Mrs. Lyster-Smythe, of Barbavilla, Westmeath, and was 22 years of age.

IN MEMORIAM.

McCUDDEN.—To the memory of our dear son and brother Jim (Major J. T. Byford McCudden, V.C., etc., R.A.F.), killed on his way to duty in France, July 9th, 1918, aged 23 years. R.I.P. From his sorrowing Father, Mother, sisters and brother.

MARRIAGES.

CARTLEDGE—PRITCHARD.—On July 2nd, at Barnes Parish Church, Reginald Arthur (late H.A.C. and R.A.F.), elder son of Arthur Cartledge, 9, Chislehurst Road, Richmond, Surrey, was married to Laura Winifred May, eldest daughter of the late Thomas Pritchard, C.E., and Mrs. Pritchard, of 56, Treen Avenue, Barnes, by the Rev. Bernard M. Kitson, M.A.

CHARTERIS—VALENTINE.—The marriage of Capt. Ronald Charteris (late R.F.C. and R.A.F.) and Mrs. James Valentine took place very quietly on July 3rd at the Chapel Royal, Savoy. The bride, who is the daughter of the late Major-General G. W. Knox and of Lady Sybil Knox, sister of the Earl of Lonsdale, was given away by her brother, Mr. Henry Knox, and Capt. Ellice Sassoon, R.A.F., was best man. Only the nearest relatives were present, these being Lady Louisa Charteris (mother of the bridegroom), Colonel Nigel Charteris, C.M.G., D.S.O., and Mrs. Charteris, Mrs. Drury Lowe, the Countess of Lonsdale, the Hon.

Lancelot Lowther and Mrs. Lowther, Mr. Christopher Lowther, M.P., Mrs. Henry Knox, Capt. Charles Chaplin, and Major A C. T. Veasey.

The bride, who is the widow of the late Major James Valentine, D.S.O., R.F.C., one of the earliest of British aviators, was for three years a French military nurse in France, and was awarded the Médaille des Epidémies and the Palmes d'Honneur by the French Government.

The bridegroom, who was the first officer to join the Special Reserve of the Royal Flying Corps in 1912, holds the 1914 Star, having gone to France with the first detachment of the R.F.C. at the outbreak of war. He is Managing Director of the famous A.B.C. Motor firm, and except for his service with the R.F.C., has devoted himself entirely during the past nine years to the improvement of aero-engines.

Among those most closely concerned with aviation Captain Charteris has always been liked for himself and respected for his pluck in sticking to his self-imposed task of producing a really good British engine, and all who have had to do with him will wish him and his bride every happiness in their future life

PERRIN—GRAZEBROOK.—On June 30th, at Lillington Parish Church, Capt. Eugene Courtenay Perrin, O.B.E. (4th Bn. Cheshire Regt., and R.A.F.), elder son of John E. Perrin, of Hoylake, Cheshire, and Mrs. Perrin, was married to Katherine Arthur Mary Violet, widow of Capt. C. A. Glazebrook, K.R.R.C., and daughter of the late Arthur Hickman and Mrs. Morgan, of Radlett, Herts., by the Rev. Canon Barker, great uncle of the bride, assisted by the Rev. S. B. Williams.

BIRTH.

HILTON.—On June 30th, at the Sarum Road Nursing Home, Winchester, to Phyllis, wife of Capt. R. Hilton, M.C., D.F.C., R.A. (late R.A.F.), a son (Peter).

AIR FORCE.

DEATHS.

FOWLER.—Lieut. Donald Alexander Fowler, R.A.F., who was accidentally killed while flying at Winchester on June 26th, was the son of the late Lieut.-Col. B. W. Fowler, R.A.M.C., and of Mrs. Fowler, 15, St. Minver Road, Bedford. He was 24 years of age.

LATHAN.—At the inquest at Islington on July 7th on the body of Edgar George Lathan, aged 20, lately residing at Kingsley Road, Palmer's Green, who was killed by the collision with a motor-omnibus of a motor-cycle on which he was riding, it was stated that as a lieutenant in the R.A.F. Lathan had been seriously wounded in action at a height of 14,000 ft. or 15,000 ft. His goggles were struck by shrapnel and the bridge of his nose was smashed. While descending he was again wounded by anti-aircraft guns, and fell a distance of two miles. He recovered from his wounds and was bright, vigorous, and active.

The inquest was adjourned in order that the driver of the cycle, who was seriously injured, might give evidence.

ENGAGEMENT.

PERMAN—RICE.—The engagement is announced of Lieut. Ian M. Perman, R.A.F., son of Mr. W. H. Perman, Inchiquin, County Clare, to Norah, only daughter of Major-General Sir Gerald C. S. Rice, of Cliff Court, County Donegal.

MARRIAGES.

BOYS ADAMS—CARNEGY ARBUTHNOTT.—On July 2nd, at St. Paul's, Knightsbridge, Lieut.-Colonel Wilmot Boys Adams, late R.A.F., was married to Enid, second daughter of J. Carnegy Arbuthnott, of Balnamoon, Brechin, and 34, Roland Gardens, S.W.

DICK—WISEMAN.—The marriage took place on July 1st at St. Mary Abbot's Church, Kensington, of Capt. Arnold John Dick, late R.A.F., eldest son of the late Mr. Walter David Dick and Mrs. Dick, of Hillhead, Glasgow, and Miss Margery Elizabeth Wiseman, third daughter of Elizabeth Lady Wiseman and the late Captain Sir William Wiseman, R.N. The service was conducted by the vicar, the Rev. E. Marling Roberts.

PAINE—NORTON.—On June 3rd, at St. Alban's Church, Westcliff-on-Sea, Lieut. James T. Paine, R.A.F., was married to Mabel, youngest daughter of Mrs. Norton and the late Fredk. Norton, of 20, Gordon Road, Lowestoft.

TOLFREE—NASH.—On June 26th, at Cairo, Lieut. H. Norman Tolfree, R.A.F., son of Mr. and Mrs. W. H. Tolfree, of Winsford, Cheshire, was married to Frances Winifred, only child of Mr. and Mrs. Francis R. Nash, of Camelot, Guildford.

BIRTH.

TURNER.—On July 4th, at Wanstead, the wife of Captain Bertrand Turner, R.A.F.—a son.

THE ROYAL AERO CLUB.

TECHNICAL AND COMPETITIONS COMMITTEE.

A meeting of the Technical and Competitions Committee was held on Monday, June 30th, 1919, when there were present: Lieut.-Col. F. K. McClean (in the Chair), Mr. Griffith Brewer, Lieut.-Col. T. O'B. Hubbard, M.C., R.A.F., Major R. H. Mayo, Lieut.-Col. Alec Ogilvie, R.A.F., and Mr. H. E. Perrin, Secretary.

CLASSIFICATION OF AERODROMES.—The Committee considered the draft scheme for classification of aerodromes received from the Air Council. A report was drawn up for submission to the committee of the club.

JACQUES SCHNEIDER MARITIME CUP.—The arrangements in connection with this competition were considered.

FLIGHT FROM ENGLAND TO AUSTRALIA.—The supplementary regulations suggested by the Australian Commonwealth were considered and approved.

COMMITTEE MEETING.

A meeting of the Committee was held on Tuesday, July 1st, 1919, when there were present: Brig.-Gen. Sir Capel Holden, K.C.B., F.R.S. (in the Chair), Mr. E. C. Bucknall, Mr. G. B. Cockburn, Lieut.-Col. T. O'B. Hubbard, M.C., R.A.F., Lieut.-Col. F. K. McClean, Lieut.-Col. Alec Ogilvie, R.A.F., Col. C. R. Samson, D.S.O., R.A.F., Mr. A. Mortimer Singer, and Mr. H. E. Perrin, secretary.

NEW MEMBERS.—The following new members were elected:—Capt. Sir John Alcock, K.B.E., Lieuts. Sir Arthur Whitten Brown, K.B.E., and Douglas Henry Walter Arnot (Argyll and Sutherland Highlanders), Basil Johnson, Major Charles Henry Chichester Smith, R.A.F., Sir Charles Cheers Wakefield.

CLASSIFICATION OF AERODROMES.—The report of the Technical Competitions Committee was received and approved and ordered to be sent to the Air Council.

JACQUES SCHNEIDER MARITIME CUP.

The Jacques Schneider Maritime Cup having been won in 1914 by C. H. Pixton on a Sopwith sqplane, the nominee of the Royal Aero Club representing the British Empire, the race for 1919 will be held in England early in September next, the exact date and place will be announced later.

The race will be over a distance of 200 nautical miles exclusively at sea, in a closed circuit having a minimum course of five nautical miles, and situated outside any port or enclosed harbour. At least two alightings must be made on the water at points fixed by the officials.

The Committee of the Royal Aero Club will select the three competitors to represent the British Empire, and reserves to itself the right to hold eliminating trials.

Entries are to be made at the Royal Aero Club, 3, Clifford Street, London, W.1, not later than July 31st, 1919. Each entry must be accompanied by the Entry Fee of £20.

AVIATION INSURANCE.

The Royal Aero Club has given its official approval to the Aviation Policies of the Aviation and General Insurance Co., Ltd., 56, St. James Street, London, S.W.1, and arrangements have been made for Members of the Club to receive a rebate of 20 per cent. upon all premiums

A feature of the Policy issued by the Aviation and General Insurance Co., Ltd., is that in the event of any difference of opinion arising the same shall be settled by an arbitrator or arbitrators to be appointed by the Committee of the Royal Aero Club, whose decision shall be binding.

GOLD MEDALS FOR CAPT. SIR JOHN ALCOCK, K.B.E., AND LIEUT. SIR A. WHITTEN BROWN, K.B.E.

The Committee at its meeting on June 17th, 1919, unanimously resolved to award the Gold Medal of the Club to both Capt. Sir John Alcock, K.B.E., and Lieut. Sir A. Whitten Brown, K.B.E.

These medals were presented by the Chairman of the Club, Brig.-Gen. the Duke of Atholl, K.T., M.V.O., D.S.O., at the Club's banquet on June 23rd, 1919.

FLYING SERVICES FUND COMMITTEE.

A meeting of the Flying Services Fund Committee was held on Wednesday, June 18th, 1919, when there were present: Lieut.-Col. T. O'B. Hubbard, M.C., R.A.F. (in the Chair), Mr. Chester Fox, and Mr. Harold E. Perrin, secretary.

GRANTS AND ALLOWANCES.—The following Grants and Allowances were made:—

(27) A Grant of £5 to an Ex-Petty Officer in the Royal Naval Air Services who had been incapacitated on active service

(51) An allowance of £2 a month for six months to the widow of a Sergeant in the Royal Flying Corps who had been killed on active service.

(73) An allowance of £2 a month for six months to the widow of a 3rd Class Air Mechanic in the Royal Air Force who had been killed on active service.

(76) An allowance of £3 a month for six months to the father of a Corporal in the Royal Flying Corps who had been killed on active service.

(90) An allowance of £4 a month for six months to a 2nd Lieutenant in the Royal Flying Corps who had been incapacitated on active service.

(106) An allowance of £2 a month for six months to the widow of a 3rd Class Air Mechanic in the Royal Flying Corps who had been killed on active service.

(111) An allowance of £1 10s. a month for six months to the widow of a private in the Royal Flying Corps who had been killed on active Service.

(112) A Grant of £20 to the widow of a 1st Class Air Mechanic in the Royal Air Force who had been killed on active service.

(113) An allowance of £4 a month for six months to the widow of a Flight-Serjeant in the Royal Flying Corps who had been killed on active service.

(121) An allowance of £2 a month for six months to the widow of a 2nd Class Air Mechanic in the Royal Flying Corps who had died on active service.

(122) An allowance of £5 a month for six months to the widow of a 2nd Class Air Mechanic in the Royal Flying Corps who had died on active service.

(197) A Grant of £15 to the mother of a Flight Cadet in the Royal Air Force who had been killed on active service.

(200) A Grant of £10 to an Ex-Corporal in the Royal Flying Corps who had been incapacitated on active service.

(201) An allowance of £2 a month for six months to the mother of a Serjeant Mechanic in the Royal Air Force who had died on active service.

(204) An allowance of £2 a month for twelve months, for the upbringing of her child, to the widow of a 2nd Class Air Mechanic in the Royal Air Force who had been killed on active service.

(211) A Grant of £5 to the widow of a Private in the Royal Air Force who had died on active service.

(212) An allowance of £1 10s. a month for six months to the mother

of a 2nd Class Air Mechanic in the Royal Naval Air Service who had been killed on active service.

(213) An allowance of £2 a month for six months to the widow of a Chief Mechanic in the Royal Air Force who had died on active service.

(214) A Grant of £10 and an allowance of £2 a month for six months to the widow of a Private in the Royal Air Force who had died on active service.

(216) An allowance of £2 a month for six months to the widow of a Private in the Royal Air Force who had been killed on active service.

(218) An allowance of £2 a month for six months to the widow of a Private in the Royal Air Force who had been killed on active service.

(219) An allowance of £1 10s. a month for six months to the widow of a 3rd Class Air Mechanic in the Royal Air Force who had died on active service.

CERTIFIED TRIALS.

GENERAL REGULATIONS.

(Under the Competition Rules of the Royal Aero Club.)

OBJECT.

1.—The object of the Trials is to test the merits of an aircraft as a whole or in part of an accessory under various conditions. The competitor may make a request to have any particular quality or merit tested and certified.

CERTIFICATES.

2.—The Club will give a Certificate of the actual performance during the Trial, and an official observer, or observers, will be provided for the Trial by the Club. The Certificate shall be a record of the Trial, containing such details of the aircraft or part thereof under Trial, and any observations the Club may find desirable. The Club undertakes that a copy of each Certificate shall be published in the Official Organ of the Club.

OBSERVATION.

3.—The Trial shall be under the control and observation of the Club. The Club reserves the right to stop a Trial if, in its opinion, such Trial from any cause would tend to endanger life or limb.

TRIAL VOID.

4.—Should the competitor be prevented from carrying out the Trials owing to the absence of the observer, or from any cause within the Club's control, the Club may issue such Certificate as the occasion warrants, and at its discretion return the whole or part of the entry fees. Should the Trial be postponed or cancelled at the request of the competitor, the entry fee will not be returned.

WITHDRAWAL.

5.—The competitor may, at any time before the completion of the Trial, give notice in writing to the Club that he wishes to withdraw from the Trial, and shall state his reason. In the event of such notification, the aircraft shall, at the discretion of the observer, remain under observation until the cause thereof has been investigated and the aircraft released by the Club.

WORKING HOURS PER DAY.

6.—An aircraft in flight shall not be observed save between the hours of sunrise and sunset, unless particular provision is made therefor in the Regulations agreed to by the Club.

START AND FINISH.

7.—Trials shall start from, and finish at, or be held at, such places as may be agreed to by the Club. The competitor shall give notice to the observer of his intention to commence the Trial, and the observer shall record the moment of starting.

ENTRIES.

8.—Every entry shall be made upon the official Entry Form of the Club, and shall state the nature of the Trial, and the number of days to be occupied.

No entry will be accepted unless accompanied by the entry fee, which is not returnable, except as laid down herein.

The Club reserves the right to refuse any entry without giving a reason, or to limit the length of any Trial at its discretion.

FEES.

9.—Fees for the Trial shall be determined by the Club in accordance with the nature, duration, and venue of the Trial.

ADVERTISING THE TRIAL.

10.—A competitor by entering for a Trial agrees to accept the official records of the Club, and authorises the Club to publish them in such manner as the Club thinks fit. The competitor may publish only the full and complete Certificate issued by the Club. In the event of his desiring to publish, by way of advertisement or otherwise, any other matter relative to the Trial, he shall submit a proof of such matter to the Club before its publication, and he undertakes not to publish any such matter until he has received the written authority of the Club.

UNRECOGNISED TRIALS.

11.—No Trial shall be recognised except such as is officially observed or sanctioned by the Club. Should an unrecognised Trial be held, and should any publicity or advertisement be given thereto, any person taking part in such Trial and/or the manufacturers and/or the machines shall be liable to disqualification and suspension.

RESPONSIBILITY FOR DAMAGE.

12.—A competitor by entering waives any right of action against the Club for any damages sustained by him in consequence of any act or omission on the part of the officials of the Club or its representatives or servants or any fellow-competitor.

The aircraft shall at all times be at the risk in all respects of the competitor, who shall be deemed by entry to agree to waive all claim for injury either to himself, or his aircraft, or his employees or workmen, and to assume all liability for damage to third parties or their property, and indemnify the Club in respect thereof.

13.—In these regulations the word "aircraft" shall be held to mean the aircraft and/or its parts and/or accessories, whether under tests or not; the word "competitor" shall include any person or body making entry for or taking part in any Trial or Competition, except any passenger other than the driver or mechanic; the word "entrant" shall mean the person or persons entering the aircraft for a Competition.

INTERPRETATION OF REGULATIONS.

14.—The interpretation of these Regulations shall rest entirely with the Club, which may from time to time alter, add to, or omit from them, and may in the case of any special Trial modify the Regulations to suit any particular case.

CERTIFIED TRIALS.—SPEED.

(Under the Competition Rules of the Royal Aero Club.)

REGULATIONS (Aeroplanes).

1.—Certificates of speed will be delivered in respect of flights over a straight course of not less than one kilometre. Each Trial shall consist of four flights out and back in quick succession, and the times will be taken at the moment of passing each mark. The speed of the Trial shall be the mean of the speeds of the flights out and back.

2.—The Competitor shall rise from the ground to the height at which he proposes to cover the measured distance, and shall maintain approximately the same level throughout the trial.

3.—All flights must be controlled by one official observer assisted by at least one official timekeeper, both previously approved by the Club, and a mark-keeper approved by the observer, at each mark.

4.—The course over which the flight is accomplished must be certified by a surveyor approved by the Club, and checked by the observer, the surveyor's plan being lodged with the Club.

5.—Entries must be made upon the Entry Form provided for the purpose, and must be accompanied by a remittance of £5 5s., the amount of the fee. The Entry Form, which must be duly filled up as regards the nature of the test and full particulars of the Aeroplane, must reach the Secretary at least seven days prior to the Trials.

If desired by the Competitor the carried weight shall be recorded on the Certificate. For details, see Regulations 1, 2 and 3, Weight carrying.

CERTIFIED TRIALS.—VERTICAL SPEEDS.

(Under the Competition Rules of the Royal Aero Club.)

REGULATIONS (Aeroplanes).

1.—Certificates for vertical speed, *i.e.*, climbing speed, will be delivered in respect of flights recorded by barograph and controlled by an official observer appointed by the Club.

2.—The barograph must be provided by the Competitor, and be provisionally approved, set, and sealed by the observer prior to the start.

3.—The record sheet of the barograph must travel at least 6 inches in one hour.

4.—The test shall be reckoned to have commenced at the time when the Competitor shall have risen 100 feet as registered on the barograph.

5.—The Certificate will state the time taken to rise 1,000 feet, 2,000 feet, and so on per 1,000 feet above the 100 feet starting level. Failure to attain a height of 1,000 feet above the starting level will be recorded on the Certificate.

6.—After the descent the Competitor shall deliver the barograph to the observer, who shall take charge of it and deliver it sealed to the Royal Aero Club for examination. In the event of the Competitor alighting at a distance from the starting point, he shall immediately take steps to inform the observer of his whereabouts.

7.—Entries must be made upon the Entry Form provided for the purpose, and must be accompanied by a remittance of £5 5s., the amount of the fee. The Entry Form, which must be duly filled up as regards the nature of the test and full particulars of the Aeroplane, must reach the Secretary at least seven days prior to the Trials.

If desired by the Competitor the carried weight shall be recorded on the Certificate. For details, see Regulations 1, 2 and 3, Weight carrying.

CERTIFIED TRIALS.—HEIGHT.

(Under the Competition Rules of the Royal Aero Club.)

REGULATIONS (Aeroplanes).

1.—Certificates of height will be delivered in respect of flights recorded by sealed barograph. The ascent must be performed in the presence of an official observer, who will, independently of the barograph, record the time of leaving the ground, and, if possible, alighting.

2.—The barograph must be provided by the Competitor, and be provisionally approved, set, and sealed by the observer prior to the start.

3.—After the descent the Competitor shall deliver the barograph to the observer, who shall take charge of it and deliver it sealed to the Royal Aero Club for examination. In the event of the Competitor alighting at a distance from the starting point, he shall immediately take steps to inform the observer of his whereabouts.

4.—Entries must be made upon the Entry Form provided for the purpose, and must be accompanied by a remittance of £5 5s., the amount of the fee. The Entry Form, which must be duly filled up as regards the nature of the test and full particulars of the Aeroplane, must reach the Secretary at least seven days prior to the Trials.

If desired by the Competitor the carried weight shall be recorded on the Certificate. For details, see Regulations 1, 2 and 3, Weight carrying.

CERTIFIED TRIALS.—WEIGHT CARRYING.

(Under the Competition Rules of the Royal Aero Club.)

REGULATIONS (Aeroplanes).

1.—Certificates for weight or passenger carrying will be delivered in respect of flights where each passenger carried must be at least 18 years of age and not less than 10 stone 3 lb. in weight.

2.—The carried weight shall comprise the weight of the Competitor, passenger (if any) and ballast, but shall not include fuel.

3.—The weight must be verified by an observer appointed by the Club, immediately before and after the flight and all weighing must be done on Government tested machines, provided by the Competitor and approved by the Club.

4.—The attempt shall be for a minimum flight of 15 minutes.

5.—Entries must be made upon the Entry Form provided for the purpose, and must be accompanied by a remittance of £5 5s., the amount of the fee. The Entry Form, which must be duly filled up as regards the nature of the test and full particulars of the Aeroplane, must reach the Secretary at least seven days prior to the Trials.

Should a further Certificate be desired for speed with a given weight, vertical speed with a given weight, or height with a given weight, the Regulations for the respective tests will be followed, in addition to the above, as far as applicable.

ON PREPARING FOR WAR.

Imprimis, let it be understood that this article is not intended to give anybody good advice. It is not a sermon; it is purely an expression of personal opinion which includes a few prophecies. Therefore, by way of a change, I propose to drop for the time being the customary impersonal form of editorial address and to assume the first person singular. If the readers of this paper do not want my personal opinions they need not read any more of this article. They will get excellent value for their money in the rest of the paper, so they cannot complain that they have been done in any way. Let us therefore to our subject.

We are now theoretically at peace. The fact that there are twenty-seven minor wars going on at the moment need not worry us. The more important fact remains that Germany, France, Great Britain, and the United States are at peace—subject only to the ratification of impossible peace terms by various non-representative Governments. Even that need not worry us, for impossible peace terms are very like a life sentence for manslaughter. After a few years people forget about the sentence and the condemned person is let off.

Being at peace, we ought obviously to turn our attention to preparing for war, in accordance with the old injunction, "In time of peace prepare for war," and the old axiom, "The surest guarantee of peace is preparation for war."

If we were governed by an autocracy, or an aristocracy, or even by an intelligent oligarchy, or plutocracy, or bureaucracy, we might reasonably expect such preparations to be made without anybody having to jar the Government into action. But, unfortunately, we happen to be a limited monarchy almost completely in the hands of a democracy tempered by plutocracy.

Now, democracy means government by the "demos" or people. And nobody has seriously disputed Carlyle's dictum that the population of these islands consists of so many millions of people, "mostly fools." Therefore we are actually governed mostly by fools, or, alternatively, by knaves who have humbugged the fools into electing them to the places of government. Nobody who has ever attended a session of the House of Commons or who has read Hansard can have any lingering doubts on that point. Consequently we cannot expect this or any other Government to prepare for war until that war actually breaks out, as was the case in the late lamented European squabble.

But there does happen to be an intelligent minority, fairly evenly spread over all grades of society, among our millions of fools, which realises that we must prepare for war if we are to remain a Nation, let alone an Empire. Before this war the Navy League, by constant agitation, which was made possible largely by the financial and social help of that fine example of the English gentleman, the late Mr. Robert Yerburgh, managed to squeeze enough money out of successive and always reluctant Governments to enable the Admiralty to build the biggest Navy in the world, albeit perhaps not the most intelligently or efficiently organised.

The mere size of that Navy secured this country against invasion, and played a decisive part in ending the war by starving the German people into a low state of moral. For this we have to thank Mr. Yerburgh, and Mr. Pat Hannon, the Secretary of the Navy League during its most active years, more than the British Government or the majority of the British People.

Aircraft in the Next War.

It is evident that in the next war aircraft will play a part similar to, but far more important than, that played by the ships of the King's Navy in this war.

In the first place our anti-aircraft defences—which ought forthwith to be established as a permanent institution on a far larger scale than the coast defences under the Army—will have to assure the immunity of this country from invasion by air.

In the second place, our seagoing aircraft will have to protect our trade routes against attack by enemy submarines and surface ships.

In the third place, our aircraft with the Army in the field will have to do all the air work required by the Expeditionary Force.

And, fourthly, another force of aircraft, bigger than all the other sections put together, will have to carry war into the enemy's country.

Thus it is easy to see that the task of the Flying Services in the next war will be far greater than that of any other of the King's Armed Forces. And to-day it is proposed by our democratic Government, not only to cut down our Navy (which can be spared, if our Air Force is built up to proper strength), and to cut down our Army (which cannot be spared, because an Army of Occupation in enemy territory is the only guarantee that a war is won), but to cut down our Air Force to a size which in the next war will be in pretty well the same proportion to our needs as the historic first four squadrons were to our needs in this war.

The Task of a Territorial Association.

That is what Democracy is going to do for us, if we allow it. There is thus evident need for a strong organisation of the intelligent minority to do for the Air Force what the Navy League did for the Navy. It might be done by a purely propagandist body, such as a reorganised and thoroughly vitalised Aerial League might become. But my personal opinion is that it can be done still better by a practical organisation such as a Territorial Air Force Association may become if it is founded by the right people, if it secures the right patrons, and if it is conducted by an energetic secretariat.

The task of a Territorial Air Force Association would be precisely similar to that of the T.F. Association in connection with the Army, but on a far grander scale, for it would include sea work as well as land work. And one believes that it would ultimately have to deal with greater numbers of men.

It must have men of unimpeachable honesty of purpose at its head. And it must be conducted in a dignified and yet energetic manner. It must use the public Press to the utmost in popularising the movement. But it must not allow itself to be run by the Press for advertisement purposes.

Thus, and thus only, shall we be able to build up an adequate Air Force in preparation for the next war. Volunteer aviation must become a national sport, as archery was in the days when England was becoming a World Power.

How the details are to be organised I leave to cleverer brains than mine, but to those who approve of the general idea I recommend that they read "The Army of a Dream" written by Mr. Kipling some fifteen years ago. Therein they may find inspiration for their task.

Why a Next War?

"But," some people may ask, "why a next war? Have we not formed a League of Nations to ensure that there shall be no next war? Have we not President Wilson's Fourteen Points? Are not small nations to self-determine themselves, and thus remove all possible causes of war? Is not the International Police Force to be formed to stop any threatening war before it begins? Are not national armies to be limited so as to make wars impossible?"

As they say in Parliament, "The answer is in the negative." So long as man is a fighting animal, so long will war continue. Leagues and alliances may avoid or check war for a while, but war must come in the end. History, as I have remarked on several occasions, is the greatest plagiarist in all literature.

An Historic Plagiarism.

Read what a great historian has to say concerning a League of Nations formed for "the mutual preservation of states, so that the more powerful might not oppress the less powerful, and that each should keep what rightly belongs to him."

The League in question was formed in 1495 between Spain, the Holy Roman Empire, the Pope, Milan, and Venice to check the ambition of Charles VIII. of France. The words quoted are those in the assertion of the basis on which the League rested. Do they differ from the pious assertions of Mr. Lloyd George and President Wilson?

Here is what the late Dr. Mandell Creighton, the Bishop of London, had to say on this precious League in his monograph on Cardinal Wolsey, published in 1906:—

"This League marks a new departure in European affairs. There was no mention of the old ideas on which Europe was supposed to rest. There was no recognition of papal or imperial supremacy; no principle of European organisation was laid down. The existing state of things was to be maintained, and the contracting Powers were to decide amongst themselves what rights and claims they thought fit to recognise. Such a plan might be useful to check French preponderance at the moment, but it was fatal to the free development of Europe. The States that were then powerful might grow in power; those that were not yet strong were sure to be prevented from growing stronger. . . . European affairs were to be settled by combinations of powerful States."

Reading Germany for France, is there anything in that statement which does not apply precisely to our present preposterous League of Nations? See, then, what Dr. Creighton has to say as to the outcome of the League:—

"The results of this system were rapidly seen. France, of course, was checked for the time; but France, in its turn, could enter the League and become a factor in European combinations. The problem now for statesmen was how to use this concert of Europe for their own interests. . . . The notion of a maintenance of European equilibrium faded away before such a prospect.

"This prospect, however, was only in the future. For the present there was an opportunity for endless scheming. The European League for the preservation of the existing state of things resisted any expansion on the part of smaller States, but encouraged compacts for aggression amongst the more powerful."—Be it noted in passing that we have just been informed of an alliance between France, Great Britain, and the United States, excluding Italy and our nineteen other Allies.

I recommend the study of the history of this League of 1495 to those who may be so foolish as to believe in the League of 1919, and I recommend the study of Cardinal Wolsey's diplomacy to those who imagine that we of to-day are any different from the Englishmen of four hundred and twenty odd years ago. The chief difference is that whereas Wolsey kept England out of that particular League and used her splendid isolation, as the great Marquess of Salisbury did, to swing the balance of power as he willed, our politicians of to-day, not being statesmen, rush into the League, so that they must either be swung with the rest or, if they wish to maintain our British independence, must withdraw from the League when occasion demands and so give our enemies another charge to throw at "perfidious Albion." In fact, this alliance with France and the United States is already incompatible with the idea of a general League of Nations, though it is an eminently sensible alliance when regarded from the point of view of the older and more practical diplomacy.

However, there you have the League of Nations of 1495. Consider whether it did anything to stop war. So far as history shows, it carried on war with considerable success from 1495 till 1515 in its effort to stop war. And it then produced a Universal Peace, which lasted from 1515 till 1518—three whole years.

Our recent squabble has been shorter and perhaps our peace may be longer, though my personal opinion is that this peace will merely merge in a new series of wars, as I hope to show hereafter. Meantime we are at peace with our late enemies and at war with the majority of the greatest of our former Allies—Russia to wit, which was certainly the greatest of our Allies in point of size of area and population. For, be it noted, Bolshevik means nothing more nor less than a member of the majority (mostly fools—as aforesaid).

With Whom the Next War?

At present we are too near the recent war to see it in quite the right historic perspective. Our ignorant journalists have hailed it as Armageddon, to be followed by Universal Peace, and the Kingdom of Christ upon Earth. In all reverence I wish that such were the truth. But if we wish to attain to something like the right perspective it is necessary to consider the view of a great Chinese mandarin, who, when asked somewhere about the middle of the war what he thought of the Great World War, replied philosophically: "We in China pay but little attention to the tribe-fights of Western barbarians."

I have quoted this saying before, but it seems apposite and necessary to repeat it. For in no sense has this been a race-war. It is true that it began as a race-war between the Slavs and the Teutons, but the Teutons soon held the Slavs at bay. The real fighting developed into a struggle in which the Teutonic tribes of Germany and Austria contended with the Teutonic Franks, Burgundians, Belgicæ, and Anglo-Saxons. There were a few odd Slavonic and Semitic (*id est*, Turkish) tribes forced in as auxiliaries on one side, and there was an assortment of Latins and Kelts, together with a vast variety of coloured races, persuaded, bribed, or conscripted as auxiliaries on the other side.

Be it remembered that Italy has never had any quarrel with Germany, and but little with Hungary. Her

sole desire was to get back certain small patches of territory inhabited by Italians. And Italy has as little love for her Jugo-Slav neighbours to-day, now that they are an independent republic, as she had for them when they were part of the Austro-Hungarian Empire. The purely Latin tribes of Southern France took but little personal interest in the war, as anybody can bear witness who knew that area during the past four years.

The real race-war, when it comes, will be between the Teutonic Race and the Slav Race. There may be many minor wars before that comes, but that will be the first great race-war since the Teutonic tribes began to over-run Gaul in the later days of the Roman Empire.

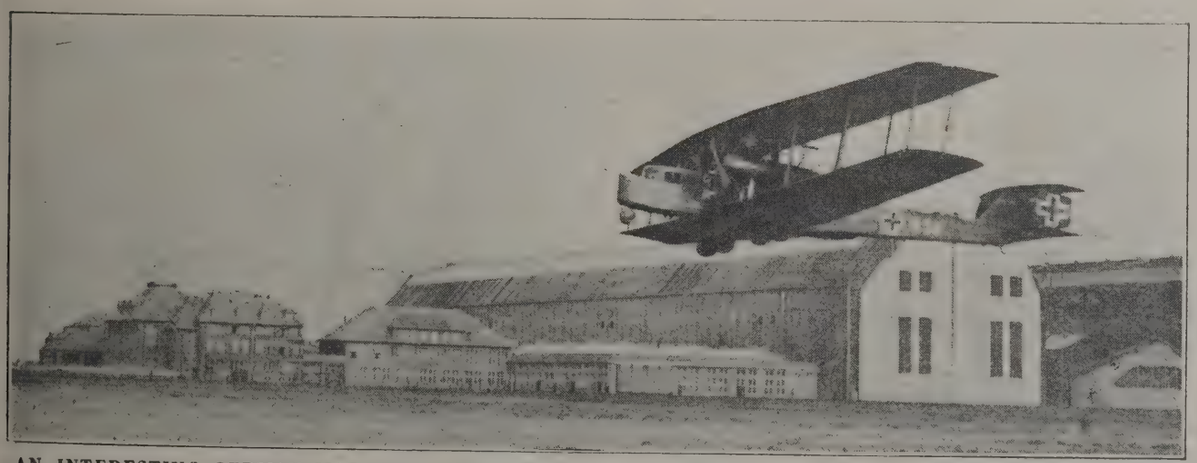
A Minor Prophecy.

This is by no means a new idea, for in the issue of this paper published on August 5th, 1914, the day after the declaration of war, I wrote:—"Thanks to the machinations of politicians who pose as statesmen, the Powers find themselves grouped quite in the wrong way. Our alliance with France is as it should be, but that the two leading civilised nations should find themselves allied with Russia against Germany and Austria is altogether unnatural. The alliance with Russia is against all reason. 'Scratch a Russian and you find a Tartar' is an ancient proverb. Scratch a Tartar and you find a Chinaman is a logical sequel. The Slav is the real 'Yellow Peril,' for the Slav is at bottom an Asiatic.

"If Russia comes out on top in this present war, does anyone think that her gratitude to us for our support will cause her to keep her hands off India when she can spare men from her German frontier? Those who know the Russo-Indian problem will remember the admonition of the old shikarri in Mr. Kipling's famous allegory—'Make not your peace with Adam-zad, the bear that walks like a man.'"

Already Russia is working out that prophecy. The Bolshevik outbreaks in India, and the Afghan attacks on the North-West Frontier, stirred up by Russian emissaries and encouraged by Mr. Montagu's political imbecilities, show how Russia is working, now that she has nothing to fear from Germany.

In that same article I continued:—"However, nothing on God's Earth can excuse Germany's unprovoked attack on France, and we have got to see France through her trouble on that account. A smashed Germany is not as good a bulwark against the advance of the Slav peoples as a solid Germany backed by France and Italy would be, but perhaps a smashed Germany may be less dangerous than a top-heavy Germany ready to fall at any moment on us and our friends the French. Therefore, in the name of common sense, let us have at it, and smash Germany thoroughly, once and for all."



It is true that there was no excuse for Germany's attack on France, but there was a very good reason. France had been drawn into that unnatural alliance with Russia. When Russia and Germany declared war, Germany was open to attack by Russia's Ally France, and it was therefore politic, if not morally right, to hit France hard and keep her quiet while Germany smashed Russia. If Great Britain had kept out of the war, as some of our politicians desired, that is probably what would have happened. But it would have been bad policy in the end, for it would have left the Prussians, a Slav tribe, dominant in Europe. So our muddled policy ultimately worked out for the best.

The War That Had to Come.

We were bound to have a war with Germany, sooner or later. From my earliest days as a kid at school, some thirty-five years ago, I remember that my older relatives and friends in the Navy regarded a fight with Germany as their sole reason for existence, and for several years before the war I knew precisely where the British Expeditionary Force was to be placed in relation to the French Army when the war came. The war just had to come, as a fight comes at school between two boys who have no immediate *casus belli*, but have just been irritating one another for months. And generally they are better friends afterwards.

There were, however, many minor causes for the war. In the issue of The Aeroplane dated August 12th, 1914, I wrote:—"One cause certainly seems to be that the enormous spread of Socialism in Germany, as shown at the last elections, has so scared the Prussian *junkers*, or land-owners, that the war has been forced on in the vain hope that a wave of patriotism will swamp the Socialists.

"Another cause seems to be that German traders throughout the world have so overrun their financial capabilities that they have been going bankrupt by the thousand and so have broken the banks which have been backing them, with the result that the big financiers behind the banks have fostered the war spirit so as to get their money back out of profits on armament and military equipment. In doing so they have plunged their country into a war which is more likely to prove their ruin than anything else."

AN INTERESTING GERMAN MACHINE.—A 4-engined Zeppelin-Staaken "Giant" (four 250 h.p. Maybach engines) converted into a passenger-carrier by removing the fifth engine which was carried in the nose of the fuselage and substituting an enclosed cabin.

One sees little in those paragraphs with which to disagree five years later. But the financiers have been cleverer than was expected. Five years ago we in this country knew less about International Finance than we do now. The wonderful organisation of the great Jewish financiers was less understood.

Financial Pressure.

In the light of present knowledge it would seem that just as the financiers rushed forward the start of the war, so they ended it prematurely for their own benefit. Is it possible that Marshal Foch and the commanders of the Allied Armies would have allowed the Germans an armistice when they did if they had not been ordered to do so by the Allied politicians acting under orders from the International financiers?

When the Armistice was declared the German Army was on the point of breaking, but it had not broken. The Independent Air Force was on the point of bombing Berlin and wrecking the Rhine cities. A month more of war would have seen the victorious armies of the Allies in the wealthiest part of Germany. And not the most rigid discipline would have prevented the looting of the captured towns. The situation was perilous for the German Jew financier and his chief seat, the city of Frankfort.

And so the politicians ordered the Armistice, and the German Army retired into Germany beaten, but unbroken.

All for the Best.

Perhaps it was all for the best. When that great race-war with the Slavs breaks out we shall need the help of the German Army. And then it may be well that the Germans have not altogether lost their moral.

When, after the Battle of Mons, the British Army was in full retreat, Mr. Hamilton Fyfe, in his famous dispatch to the Sunday edition of the "Times," said, "The British Army is a beaten army, but not a broken army." It was the one consolation to the British Nation in the greatest, and most salutary, shock which it has had during the war. Similarly, when the Teuton Race has to array itself against the Slav, it may be well for us to remind the Germans that, though theirs was a beaten army, it was not a broken army.

The Germans will need little reminding, for one remembers that when the Guard returned to Berlin after the Armistice they were received with banners and flowers, as soldiers who had kept the horrors of war from the soil of the Fatherland. And very justly so, for when the Allied Armies set foot in Germany they came in peace, and no actual fighting has taken place in Germany itself.

The Whirligig of Time.

The idea of our needing Germany in the future may seem unthinkable to the narrow-minded, but as an historical fact it is not merely probable, but practically certain. History, as ever, must keep on repeating itself.

One of the most exquisitely humorous episodes in my own experience occurred just a week before the signing of the Armistice when I found myself sitting in a Hun hut in the middle of the devastated area in France, close alongside Velu Wood, between Bapaume and Cambrai, reading the account of the Battle of Waterloo as given in the British tourist's Bible, otherwise known as Baedeker. I read how "our gallant allies the Germans" held this position, how the stout Hanoverian troops held the other, how the brave Brunswickers carried such and such a strong point, and how a very considerable percentage of Wellington's Army were pure Germans. The book was lent me by a British officer, who carted a whole Baedeker library about with him, so that he should know something about the places which our troops were conquering at that period. The idea tickled him hugely.

Germany as It Was and Is.

It is in fact no more ridiculous to think of German troops as allies in a war with the Slav in the future than to think of them as allies in a war with France in the past. As I wrote in The Aeroplane of August 5th, 1914:—"Germany is built up of many incompatible elements. The Schleswiger is a Dane, and quite a good chap. The Alsatian is a Frenchman and hates Germany. The Bavarian is a peace-loving, hard-working, decent poor soul, and cordially dislikes his Prussian master. And the Pole is nothing in particular and loathes German, Russian, and Austrian with beautiful impartiality. The German Empire dissolved into its component parts may still be a useful barrier (against the Slav) and not a danger. It is Prussia, as usual, who is making a beast of herself, and it is Prussia rather than Germany whom we have to fight."

Again, in the issue of August 12th, 1914, I wrote:—"At the moment the German people are in the delirium of war fever, so they are not pleasant to meet, and for years they have been taught to hate the English, but the individual German is an easy-going, kind-hearted individual, singularly like an Englishman in most of his ways—especially in his quiet contempt for foreigners, and his offensive manner to strangers—and one hopes that when this affair is over, with all its waste of life and national wealth, we shall be better friends with our Germanic relatives. Meantime, Germany as an Empire has to be crushed out of existence, and the sooner it is done the better."

Was I very far wrong in what I wrote nearly five years ago, and before *any* news of any kind had come in from the war areas? If it seems that I have overestimated the decency of the Western German ask any of our people who has lived in Germany for the last few months with the Army of the Rhine.

If you remind me that German civilians, men and women, hooted and spat at our men when they were marched as prisoners through German towns early in the war, I ask you to explain why the good gentle people of Oswestry a week or two ago hustled and threw rotten eggs at a German officer whom they imagined to be Admiral von Reuter? The Germans acted in the heat of rising war fever. The people of Oswestry presumably acted the part of the noble and magnanimous conquerer to a beaten but gallant foe. Is that the explanation? Perhaps the kindest thing one can say about the Oswestry incident is that the place is nearly in Wales, and that the people are not typically English. One might perhaps find equally plausible excuses for various unpleasant incidents in Germany if one tried.

East Is East and West Is West.

Personally I do not like the average German. I can never forgive him for the fact that restaurant bands had to be invented to drown the noise of the Germans eating soup. But he is not half so black as he is painted, and he is not half so ill-mannered, or savage, or brutal as the Slav. The plain fact of the matter is that the farther East you go the greater is the innate savagery of the people.

German atrocities in France and Belgium were mere child's-play compared with Russian atrocities in East Prussia (although the East Prussians are themselves Slavs) during the temporary advance of the much advertised "Russian steam-roller" in 1914-15, or compared with Russian atrocities in Poland at any time in the last hundred years, or compared with the atrocities committed by the Bolsheviks on the minute percentage of decent

people in Russia ever since the rebellion against His Imperial Majesty the Czar in 1917.

Brutal crimes are common to all nations, but you will find a higher percentage in England than in Ireland, a still higher percentage in France and Belgium than in England, a higher percentage still in Germany, and the highest of all in Russia. Which again is no excuse for the German. It is merely an explanation, and an ethnological fact which cannot be altered.

So far one has merely endeavoured to show that there must be a next war, with whom that next war must be, and why it is necessary for us to maintain a big Air Force in readiness for that war. Next week I hope to hazard a few prophecies as to the manner and time of coming of that war and the part which the Air Force must play therein. The subject is one which deserves careful thought, for on it depends our future existence.

(To be continued.) C. G. G.

THE JACQUES SCHNEIDER INTERNATIONAL RACE.

The race for the Jacques Schneider International Trophy will be held on Wednesday, September 10th, 1919, at Bournemouth. The course will be over a circuit of about 30 miles, starting from Bournemouth and taking in Swanage and Christchurch.

S. E. Saunders, Ltd., the well-known yacht and aircraft builders, of Cowes, Isle of Wight, have kindly placed their new erecting shops and slipways at the disposal of the Royal Aero Club for the accommodation of the competing machines.

Machines representing the British Empire must be ready not later than September 1st, 1919.

The Committee of the Royal Aero Club will select the three competitors to represent the British Empire, and reserves to itself the right to hold eliminating trials.

Entries are to be made to the Royal Aero Club, 3, Clifford Street, London, W.1, not later than July 31st, 1919. Each entry must be accompanied by the entry fee of £20.

This affair seems to have been arranged with all the ineptitude which one associates with Government Departments and elected bodies generally.

Bournemouth is a difficult place to reach by road, and is a hopeless place in which to find lodgings during the holiday season. Swanage is still less accessible and less habitable. As against these places there are far more attractive sites for the starting and turning points. Dover, Folkestone, Hastings, Eastbourne, and Brighton are all infinitely preferable. They are easier to reach from London, and there are more places in the vicinity in which people can live while preparing for the race.

The idea of housing the competing machines at Cowes is purely imbecile. One acknowledges that Mr. Sam Saunders has excellent accommodation, and his action in placing his shops at the disposal of the Club is worthy of his reputation for sportsmanship. But, apart from this, Cowes is about as suitable for the job as Scapa or Skibbereen.

The place is utterly inaccessible. The boat service is vile, and consequently competitors who want to get spares or material from London in a hurry will be hampered in every possible way. The housing problem in Cowes in September is as bad as it can be. And furthermore Cowes Harbour, in the yachting season, is the last place one would have chosen for the testing of racing seaplanes.

Also, the idea of housing the competing machines at Cowes and asking them to fly all the way to Bournemouth, with the attendant risks of collisions with boats in the Solent, and so forth, is as foolish as could well have been conceived. In fact the Royal Aero Club seems to be doing its best to make the event a failure instead of a success.

The only argument which one can discover in favour of the arrangement is that the house-boat of some motor-boat club or other—one forgets its name—is moored in Southampton Water, and so can, presumably, be towed round to Bournemouth if the weather is fine, so that the Committee of the Aero Club can "do" the race in ostentatious luxury, regardless of the convenience of British or Foreign competitors, heedless of the best interests of British aviation, and ruthless as to the ultimate results to the machines and those concerned with them.

It is quite bad enough to have the Department of Civil Aviation putting its hoof into it every time it awakes from its chronic lethargy and takes a step in any direction. There is some excuse for that Department, because nearly all the people who might have made it a success have been demobilised from the R.A.F. But it is a trifle too much when the Committee of the Royal Aero Club, the self-appointed Governing Body of the Sport of Aviation, joins the ranks of those who seem to be inspired to wreck Civil Aviation.

Quos Deus vult perdere prius dementat. It seems either that it is the will of Providence that Civil Aviation should be destroyed, or, which is what one hopes, that those who are misgoverning Civil Aviation should destroy themselves and thus leave room for competent people who think more about the progress of British Aeronautics than about either holding down their jobs or doing a little imitation yachting with the great International Seaplane Race as a kind of secondary consideration.

The Committee of the Royal Aero Club has not distinguished itself in the past by its intelligence in handling matters of real importance to British Aeronautics. One had hoped that the election of several practical aviators to the Committee might have brightened its collective intellect a trifle. It seems, however, that it still maintains the mental level and the angle of outlook of a parish council.—C. G. G.

ROYAL AERO CLUB

TECHNICAL AND COMPETITIONS COMMITTEE.

A meeting of the Technical and Competitions Committee was held on Tuesday last, July 8th, 1919.

JACQUES SCHNEIDER CUP.

The arrangements for the Jacques Schneider Cup were discussed, and it was decided to hold the race on Sept. 10th, 1919, and that the British competitors must have their machines ready not later than Sept. 1st, 1919, in case it is necessary to hold eliminating trials for the selection of the three competitors to represent the British Empire. The course for the race will announced later.

PRESENTATIONS TO THE CLUB.

The following framed prints have been presented to the Club by Capt. C. E. Bagram:—"Globe Aérostatique le Charles et Robert, 1783"; "A Consultation Previous to an Aerial Voyage from London to Weilburg in Nassau, Nov. 7th, 1836."

The following map has been presented to the Club by Miss Lockyer: "Time Map of the World."

The following books have been presented by the publishers to the Club library:—"Airy Nothings," by H. Barber (McBride, Nast and Co.); "Aerobatics," by H. Barber (McBride, Nast and Co.); "In the Royal Naval Air Service," by Harold Rosher (Chatto and Windus); "Guynemer: Knight of the Air," by Henry Bordeaux (Chatto and Windus); "All About Aircraft" (Car Publishing Co.); "Aircraft in War and Commerce" (Car Publishing Co.); "The Kingdom of the Air" (Car Publishing Co.); "V.C.s of the Air" (Car Publishing Co.); "The World's Air Routes" (Car Publishing Co.)

PEACE CELEBRATIONS.

In order that the House Staff may have a holiday, the House Committee has decided that no meals shall be served in the Club on Saturday, July 19th, 1919.—(By order) HOUSE COMMITTEE.

July 15th, 1919.

PONS ASINORUM.

BY CAPTAIN P. A. BARRON (LATE R.A.F.).

"Pray for an eye that sees spots in every sun and for a nose that smells carrion in every rose-bush," wrote Charles Kingsley in "Westward Ho!"

It is many years since one read it, but one remembers the injunction to "worship at the shrine of the great Goddess Detraction" and to "prove thyself wiser than the wise by pointing out the fool's motley that peeps from the rents in the philosopher's cloak." "Thus," wrote Kingsley, "shalt thou be clothed in purple and fine linen and sit in kings' palaces and fare sumptuously every day."

Few people read "Westward Ho!" nowadays, but a very large number see so many spots in every sun and smell so much carrion in every rose-bush that they miss entirely the glory of the one and the beauty of the other.

Incredulity and cynicism are characteristics of mediocre minds, and it is against the negative influence of such minds that the positive forces of progress are forever at war. Every man who has ever followed a line of original thought, and every inventor, has felt the weight of opposition and the prick of that very keen weapon, ridicule.

One feels that the first man who consumed a living oyster must have been regarded by his fellows as a person of most unpleasant habits. The hero who braved the derision of the mob by producing the Adam of all umbrellas was, quite naturally, pelted with every kind of missile from the *passé* egg to the feline in the process of dissolution.

In some dim period when our gentle ancestors did not know how to hurl each other into Hades with T.N.T., or assist their brothers to the happy hunting-grounds with poison gas, in that distant era, in short, that antedated the age of savagery in which we live, one may feel sure that the originator of a new fashion of wearing fig-leaves was outlawed by the orthodox followers of the prevailing mode.

THE UNION OF LOG ROLLERS.

In later times one supposes that if it were desired to move a heavy object, such as an invitation to dinner carved on stone, the postman would place rollers under the invitation and trundle it laboriously. Imagine the indignation of the union of log-rollers when the inventor of the wheel hit upon the idea of attaching the rollers to the object to be transported! Probably they allowed a love-letter to fall upon and crush the inventor of this labour-saving device.

And in the millions of years that have passed we have not greatly changed our mental attitude. All races are alike in this respect, for, as a French philosopher has pointed out, the only real difference between the nations is in the uniform of their police. In one's own lifetime one can recall the days when the harebrained scorcher who dashed madly about the country at the fear-inspiring velocity of twelve miles an hour was condemned to "twenty shillings or two days" as a danger to the public. One can remember boroughs that paid off the rates by persecuting cyclists and continued so to do till it was discovered that the invention of the motor-car had introduced a new and more lucrative industry for the police-courts.

One remembers a murky morning in November 1896, outside the Hotel Metropole, and the start of the historic run to Brighton which was arranged to celebrate the emancipation of motorists from the regulations that a mechanically propelled vehicle must be preceded by a man carrying a red flag.

How the mob jeered! How the Cockney satire flowed! . . . "Gawd, wot a 'eavenly smell!" . . . "Tie a moke to it, guv'nor!" . . .

And with what delight the reeking mob read that practically every one of the derided buzz-wagons had broken down! How they laughed over the efforts of the "Evening News" poet:—

"Forty little motor-cars drawn up in a line;
One blew up in Whitehall Place, leaving thirty-nine."

And so on. One quotes from memory. (No offer for a testimonial for Pelmanism will be considered.)

One remembers one's own efforts to nurse those early motor-bicycles, quadricycles, and cars that were continually "decanting their innards," to use the phrase of the immortal Mr. Pyecroft, and very vividly does one recall the cheap jeers of "the low-down whites" whenever one had trouble—which was all the time.

Yet a few enthusiasts carried on, and far-seeing people organised competitions. It was those long-distance races—Paris-Vienna, Paris-Petersburg, and so on—that first made the mocking mob realise that neither the undisciplined forces of interested enemies nor the organised opposition of the British Government could prevent the progress of an industry that would be of such vast value to the country.

And now we fly, and, glancing backwards, one sees that we are up against the *"pons asinorum"* that confronted us in the early days of motoring. Thanks to the blessing of the recent scrap, which has sharpened what little wit we have, the development of aeronauties has been more rapid than it would have been in the beer-bemuddled slackness of soul-destroying peace. But one may well ask, "What now?"

Everywhere one sees the negative forces of organised apathy opposed to progress. Our Postmaster-General states in Parliament that "aeroplanes are of only 60 per cent. efficiency," and that in consequence it is not proposed to establish aerial mail services.

A writer, and an R.A.F. officer at that, in the "Daily Mail" describes civil and commercial aviation as "a wash-out." The Air Ministry, blind to the lessons of history, scratched all the fastest machines that had been entered for the Aerial Derby. Miracle of incompetence!

A CRIME AGAINST HUMANITY.

Can it not be seen that by competition, and by competition only, can progress be made. If we have not the Germans to compete with then for God's sake let us have a little healthy competition among ourselves. To have limited the manufacture of aircraft by the Germans is a crime against human progress, as deep a blot in the history of the Allies as it would have been to say that the scientific investigation of disease must cease for fear that our late enemies should become a sounder race than we.

Among scientists there should be no petty tribal feelings. Nothing would be better for this country than to see Germany embark on a policy of aircraft construction that would show the world that she intended to make a bid for Admiralty in the Air.

Man is a fighting animal. The competitive instinct is the only good quality he possesses. If that instinct be repressed, he is little better than the beasts. In the animal kingdom man has only one friend, the dog, and he loves the dog chiefly because that high-spirited beastie fights for the sheer joy of fighting and kills inferior creatures at man's bidding.

THE ROAD TO RUIN.

In the industrial era which may be beginning, if the strikers do not bring about civil war, we need competition. If the Government and the Air Ministry pursue

their present policy, we shall find that France or the United States of America will have beaten us in the element that is destined to be of more importance to us than the sea.

France is subsidising aerial mail services while our Postmaster-General burbles about "60 per cent. efficiency," and America is proving to her people the value of aeronautics by official demonstrations of the possibilities of the machines she produced for war.

Commercial aviation is not a "wash-out" because it has not yet been washed in. We are very much in the same position as we were a few months after the historic day in November, 1896, when the motoring restrictions were withdrawn. We want the driving force of competition, the official encouragement of international races, Governmental subsidies for mail and passenger carrying services, and the creation of a strong Volunteer Air Force Reserve.

Incidentally we need a body that would prove itself more enterprising than has either the Royal Aeronautical Society or the Royal Aero Club. When one remembers all that was accomplished by the motoring societies in early days, the masterly inactivity of the R.Ae.S. and R.Ae.C. forms an unpleasing contrast.

AN AIR MINISTRY RESIGNATION.

The Secretary to the Air Ministry announces that Sir John Hunter, K.B.E., administrator of works and buildings in the Air Ministry, has tendered his resignation to the Secretary of State for Air, and that this resignation has been accepted in view of the progress made in clearing up the war work of the Ministry and the desire of Sir John Hunter to return to Sir William Arrol and Co., Ltd., of Glasgow, as soon as possible.

An intimation of the cordial thanks of the Air Council has been conveyed to Sir John Hunter for the eminent services rendered by him from December, 1917, to the present date, in dealing with the very heavy programme of works necessitated by the rapid expansion of the Royal Air Force.

FLYING BETWEEN LONDON AND PARIS.

The Air Ministry announces that:—

For the purpose of taking part in the Peace Celebrations during the forthcoming week, in Paris and London, arrangements have been made with the French Government for the opening of Civil Communication by air between London and Paris, from July 13th-20th inclusive.

British machines visiting Paris will land at Le Bourget only, and French machines visiting London at Hounslow only, except in emergency.

All machines will cross the French coast between Calais and Boulogne, and the English coast between Folkestone and Dungeness.

All machines taking advantage of these facilities must be provided with, and carry, certificates of airworthiness, issued by their respective Governments.

Passports will be carried by all civilian personnel.

A full list of passengers showing their destinations will be carried by the pilot in charge of the machine.

No goods or merchandise may be carried.

It is to be clearly understood that during the week this temporary arrangement is in force, no machine will, in any circumstances, fly over Paris.

TELLING THEM ALL ABOUT IT.

According to the "Observer," an American aviation mission, which has spent the last six weeks in studying aerial affairs in France, Italy, and England, sailed from Southampton on July 12th on the return journey to America.

It is said that the mission was sent to Europe by the United States Government to gather information on the whole subject of aviation development. In conversation with members of the party, a representative of the "Observer" was given the impression that in matters connected with flight America is considerably behind European developments, and the mission was sent over to collect particulars which may help the progress of the new industry and guide the Government in legislating for it.

The curious thing about the whole affair is the fact that comparatively few people in the Aircraft Industry knew anything about the visit of this "Mission," and one is left with the impression that either the members of the Mission went about their work in a very perfunctory way and did not trouble to go to all available sources for knowledge and information, or else that they were very carefully and skilfully "shepherded" during their visit. Perhaps it is well that our trans-Atlantic relations should not know all about our latest aircraft developments, but, on the other hand, perhaps it would be better that they should know. In the first case they might copy us too successfully, and in the second case they might be scared off trying to compete. It would be interesting to know what actually happened in this case.

It is further stated that the party included Mr. Crowell, Assistant Secretary for War; Mr. Keys, the vice-president of the Curtiss Aeroplane and Motor Company; Mr. Howard Coffin, of the Hudson Motor Car Company; and Lieut.-Colonel James Blair, of the General Staff of the American Army. Arriving in Europe on June 1st, they paid visits to France and Italy, and then came to England, where they spent a busy fortnight in examining our various aerial enterprises and in consultation with officials of the Air Ministry.

The "Observer" says that one of the most important parts of their work was to ascertain details of the laws of the air which are now being framed. "We haven't any legislation about the air yet," said one of the delegates. "Our regulations for the licensing of pilots are more of a joke than anything else. We have everything to learn in these matters, and that is why our party was sent over."

One would hazard a guess that the American regulations cannot be more of a joke than is the administration of the British regulations, and the Mission can scarcely have learned much in this country on this point except what to avoid.

The misguided delegate is said to have continued:—"But we have quite a few other things to learn as well as the way to make laws for the air. Europe is ahead of America in the commercial development of aviation, and we have had to find out what you are doing over here and get ideas. We have a few regular mail services running, but America has been more inclined to look at the sporting side of aviation than at its business aspects, and I do not think the possibilities of air transport have been properly grasped yet.

"In time, of course, we shall get a trans-continental route organised but the project has not got far beyond the stage of talk as yet. Our visit to Europe is bound to have a big effect, however, for we have been seeing what is done over here, and we are going back to tell our people all about it."

One would give a great deal to hear them tell their people all about it. One recalls the story of the little girl who came in from a walk and told her mother that she had seen a sack of coals fall off a cart onto the coalman's head. "And was he hurt?" asked her mother. "No!" said the little girl, "he just sat on the road and told God all about it."

Perhaps the American Mission's report may be something like that when they come to understand our particular method of heaping coals of fire.—C. G. C.

THE PUBLIC AND "JOY FLYING."

An article was recently published in the "Daily Mail" by Captain William Pollock, saying that civilian flying was "a wash-out."

The following letter in reply appeared in the "Daily Mail" of July 15th:—

To the Editor of the "Daily Mail."

Sir,—Capt. William Pollock's statements regarding the lack of interest in seaside flying are so opposed to my experience here that I feel that I must reply to them

On May 17th I began civilian flying at Porthcawl, a small seaside resort in South Wales. Up to date I have taken up more than 700 passengers, and, with one or two exceptions, the "wind up" has been conspicuous by its absence.

The same people come over and over again to be taken up, each time increasing their time in the air, until now I can almost say with certainty that twenty or thirty people will come for a joy-ride some time during the week, and will bring friends with them.

What has surprised me most is the number of women who bring their children to go for a flight. Last week an old lady of 68 arrived at the aerodrome with four children. She went up four times, accompanied by a child on each occasion.

To establish a connection of this sort two things are very necessary. One is to give absolute confidence to your passengers and prospective passengers, and the other is *do not "stunt."*

In common with other pilots flying at seaside resorts, I charge a guinea for five minutes. When I am coming down at the end of the time I invariably turn to my passengers and ask, "Would you care for another five minutes?" The answer is nearly always in the affirmative.

As for the machines being rarely in the air, if my engine would stand the work and I could stand the strain of the responsibility, I could keep going twelve hours a day. As it is, I am flying about five hours a day, and there is nearly always a queue waiting when I stop.

E. D. C. Herne, Capt., R.A.F.

B.T.H. Magnetos

all-British in design and workmanship, were used **on the first Airship to cross the Atlantic, the R. 34,** on the aeroplanes which secured the British altitude record, and the first and second prize-winners of the Victory Aerial Derby at Hendon.

The above performances add to the record of B.T.H. Magnetos, and support the high opinion in which they were held by pilots during the war for reliability in service.

The WORLD of AERONAUTICS

NEWS OF THE WEEK FROM ALL QUARTERS

The Aerial Chaperone.

According to the U.S.A. War Department News Bureau :—"Major T. Ord Lees, A.F.C., who, during the war, was in charge of the development of parachutes for the British Air Force, has arrived in Washington with several assistants for the purpose of demonstrating the latest British parachutes to the American Government. With Major Lees is Lieut. R. A. Caldwell, D.F.C., who jumps from airplanes to demonstrate the adaptability of the parachute. The interesting feature of the party is the presence of Miss Sylvia Boyden, a young lady of 20, who also jumps from an airplane. According to Major Lees, the jumping of this young lady has a wonderful effect on the public in that when they see a lady land safely they have more confidence in parachutes than when a man descends. Miss Boyden is accompanied by Mrs. A. M. Thomas as chaperone."

One would like to know whether the chaperone leaps from the machine with another parachute or descends with her ward by means of a Guardian Angel fitted with a dickey seat.

From Officer to Airman.

"Wing Adjutant" has been writing in the "Daily News" about the temporary officers in the post-bellum R.A.F. He says :—"In four years' time the Aircraft Industry will have settled down, aerial post, goods, and passenger services will have started, and posts will be available for men with special knowledge. The temporary R.A.F. officer, having received a thorough technical training at the expense of the country, and after four years' practical flying and work on aeroplanes, will in all probability find that there is a long waiting list of firms anxious to obtain skilled airmen, aero engineers, and air administrative men, all of whom will be included in the temporary R.A.F."

One suggests that the officer who has completed his term of four years would not be greatly interested in a firm that wanted merely "a skilled airman" or an "air administrative man"—a rating of which one has not heard. The article is sub-headed "Government openings at end of their four years' service," but no mention is made of Government appointments. Had it not been signed one might have thought these discrepancies indicated official origin.

A Miss as Good as Many Miles.

The following news has been issued by the Director of Air Service, U.S.A. :—

"Lieut. Clyde V. Finter, Pilot, with Lieut. Robert H. Stell, Radial Officer, in a Curtiss H, and Lieut. Bernard J. Tooher, Pilot, with Lieut. Robert H. Best, Radial Officer, in a Curtiss H, directed 12-inch gun-fire on target 26,000 yards at sea from Fort Hancock, N.J.

"The flight began at 1.40 p.m. and lasted 1 hr. and 50 mins. Altitude, 4,000 feet. Observation very good. Thirteen shots were fired, the first shot two miles from target; later shots bracketed the target at 140 miles. If the target had been the size of a battleship it would have been completely destroyed."

But to have ensured it being hit it would have been necessary to make the target of the size of a very large battleship indeed—one of about 125 miles in length, in fact.

The English-Speaking Races.

The following appeared in the official Air Service News Letter published at Washington :—

"Mr. J. C. Shields, news editor of the 'Houston Chronicle,' was a passenger in a flight Saturday, piloted by Lieut. C. F. Bell. Mr. Shields was permitted to handle the controls and given the usual acrobatic feats.

"Describing the acrobatics, Mr. Shields said the spiral was utterly distracting. Immelan, bowl of goulash. The loop as kaleidoscopic somersault. The zoom as two gulps and the cutting gun as a repriever."

And yet people still refer to Americans as being among the English-speaking races.

There Have Been Others.

According to the "Daily Express," "M Jean Galmot has just made a 3,700-mile trip round France in an aerial limousine, carrying six passengers. The pilot was M. Constantin. This is the first aerial circular tour ever made. The machine descended at many of the historic show places of France."

The news that the flight has been completed is interesting, but one cannot agree that it is the first aerial circular tour ever made. One heard rumours of a tour round Britain in the distant days before the war

The R.34 and Prohibition.

One of the daily newspapers stated that the R.34 hissed loudly while waiting to start, but that as soon as the rum ration was taken on board the hissing ceased and she started on her long return voyage.

Mr. Pussyfoot should have a talk with the R.34.

The Boudoir Flying Helmet.

The "Daily Express" is to blame for the following :—

"Although boudoir toilettes could hardly be adapted in the catalogue of flying fashions, some ideas in flying outfits are borrowed from the boudoir. Among these is the flying cap with the side-lapels over the ears.

"Boudoir caps of this shape are being made, and very fascinating little bonnets they appear to be. The models I notice in the West End shops are not trimmed with ribbon as other boudoir caps are generally, but retain the plain outline of the leather flying headgear."

The first paragraph is incomprehensible. One has hardly ever noticed any ideas in flying outfits borrowed from the boudoir unless the writer is thinking of the ladies' silk stockings that certain aviators have worn as mufflers. It is certainly news that the "flying cap," usually called a "helmet," but referred to in the next paragraph as a bonnet, originated in the boudoir. The designer is to be congratulated upon his/her clever idea of placing the lapels over the ears at the sides of the cap-bonnet-helmet.

Barbarous.

An American journal remarks :—

"It is strange to note how the war has affected persons in regard to the wearing of special uniforms or insignia.

"Firms and public service corporations here and there are encouraging the use of insignia and service stripes. Motormen and conductors on cars and trains, who never bothered with service marks, are now to be seen with bright gold stripes. Employees of large manufacturing companies and public service corporations are in many instances being supplied with distinctive buttons, which include some form of marking to indicate the length of service. Such insignia, so it is reported, serves to encourage long service in a company."

One trusts that ex-R.A.F. airmen employed by civil aviation companies in Britain will not be encouraged to adopt this barbarous practice.

One shudders at the prospect of seeing tweed suits decked with bright gold stripes and distinctive buttons, or bowler hats with badges. An even more ghastly thought is that if the custom became general it is almost certain that the terrifying effects produced would give the fashion department of the Bolo some new ideas for R.A.F. uniforms.

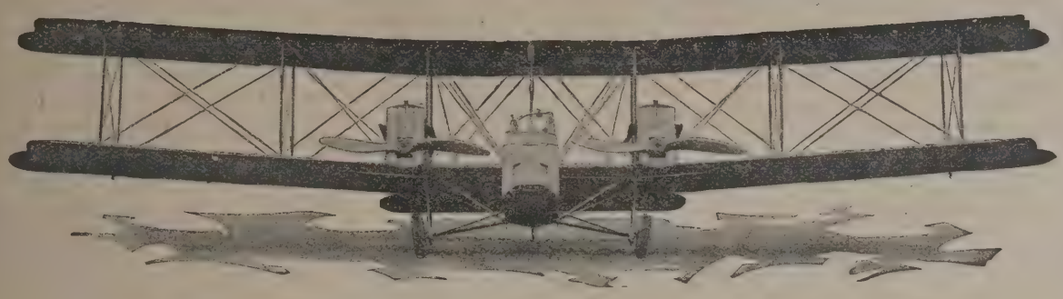
Instinct.

At the Victory conference of the North-East Coast Institution of Engineers and Shipbuilders at Newcastle on July 10th, Brig.-General R. M. Groves, C.B., D.S.O., A.F.C., said that "the unbreakable machine was hardly necessary, because pilots were developing an instinct which prevented them breaking machines in the air."

One realises the truth of the Brig.-General's statement. Often one's instinct has prevented one from indulging in the sport of breaking machines in the air.

Scroungers.

The Royal Air Force Detachment at Thetford published on July 1st the first number of their fortnightly paper, the "Scrounger." A contributor to its pages suggests a "scrounging" competition. He writes :—



"N.C.Os. would of course be barred from entering the competition, as they would possess an unfair advantage on account of their greater experience. The cook-house staff would also be barred, as they always spend their day 'off' planning how best to 'scrounge' when they are 'on' the following day.

"Another suggestion whereby 'scrounging' might be established on a properly recognised basis would be the appointment weekly of an Orderly Scrounger. Decency forbids me suggesting names of likely candidates."

A Matter of Head Resistance.

A reader wishes to know whether the "Kangaroos" which have been described as hurtling through the air at Hendon could not reduce their head-resistance by hiding their heads in their pouches. The answer is in the negative. Judging by appearances the aerial "Kangaroo's" neck is too stiff to permit of it putting its head into its pocket. The passengers, however, put their hands into their own pockets.

The WORLD of AERONAUTICS (continued)

A Sporting Offer.

The father of the late Major J. B. McCudden, V.C., D.S.O., M.C., M.M., has in his possession a bulldog named Bruiser, which was the property of his son while serving in the R.F.C. The dog is rather too much of a responsibility for Mr. McCudden's household, and he would therefore be glad to give him to an R.A.F. squadron—preferably to one in which the late Major McCudden served—if the squadron would care to have him as a mascot and in memory of his former master.

Any correspondence on the subject may be addressed to Mr. W. H. McCudden, care of this office.

The New Method.

From the "Morning Post" of July 14th:—Dirigible required for Peace Day by Mr. Charles Gulliver. Price for hire should be sent to him at the Palladium, London, W. The machine on Peace Day is to fly over West London (the Palladium) distributing bags of sweets on parachutes to children in the parks, also in the districts of his suburban theatres, viz., Kilburn, Willesden, Islington, Ilford, Lewisham, Poplar, Camberwell, Putney, Hammersmith, Shoreditch, Croylon, Clapham.

A Balloon Cloth Mystery.

The "Daily News" of July 10th stated that Mr. Brock, of Summerseat, Ashton-on-Mersey, on the previous evening had admitted buying 12 million yards of balloon cloth on behalf of a client. He appeared to be uncertain of quite how much he gave for it, but said that £1,000,000 was as near as one could say at present. It is also stated that the sale was carried out by the Disposal Board of the Ministry of Munitions, that negotiations were opened in April and completed in London on July 9th.

The "Daily Mail" of the same date stated that the report that the cloth had been purchased was premature, but that competition was very keen.

Since July 10th no other announcement appears to have been made.

A Pure Fabric-ation.

The following spasm has reached this office from an unknown source:—

Ladies call for bits of rag,
A thousand times a day
To make up frocks, or p'raps a flag
To celebrate "The Day."
For Women's wants, *They* care no jot,
They sell to Martin the bally lot.
Which seems a lot of Tommy Rot,
Opposed to all fair play.

It was announced that the Figure of Victory which formed part of the Decorations for the Paris Peace Celebration were to be fitted with wings from actual aeroplanes. An irresponsible artist has endeavoured to illustrate his entirely incorrect impression of the effect produced.

A Prosecution.

The "Daily Express" of July 14th stated that summonses arising out of an alleged serious breach of the Defence of the Realm Act have been issued against the secretary and five employees of Messrs. W. S. Laycock, Limited, Sheffield.

The ground on which the Director of Public Prosecutions has advised action to be taken is that certain spare parts for aeroplanes were used after they had been examined and rejected by Government inspectors.

Investigations into the matter by officers of the Criminal Investigation Department have been proceeding for weeks, and on July 12th the summonses were served.

The prosecution will be opened before the Sheffield justices on Thursday, July 17th, and may be followed by interesting developments.

Past Progress and Future Developments.

Some important and interesting statements and views were propounded at the resumed Victory Conference of the North-East Coast Institution of Engineers and Shipbuilders at Newcastle on July 10th.

Lord Weir, in a paper on the development of aircraft design and construction during the war, mentioned that in August, 1914, the Royal Naval Air Service possessed 93 machines and the Royal Flying Corps 179. In October, 1918, just before the Armistice, the Royal Air Force possessed over 22,000 effective machines.

During the first twelve months of the war the average monthly delivery of aeroplanes for British or foreign sources was 50; during the last year of war it was 2,700, and at the Armistice there were facilities in this country for 3,500 per month.

Lord Weir expressed the view that it was now possible to design a machine that would not break in the air, except under certain conditions, against which the pilot could be warned.

Immediate possibilities were in front of flying boats for inter-island and coastal traffic, as in the West Indies and New Zealand. The Government and large transport companies, he thought, might collaborate in their early efforts.

Sir Dugald Clerk said that the Germans standardised in aircraft engines early in the war, and it was one of the worst things they did.

Brigadier-General Groves, of the Royal Air Force, said that he agreed that there was a great future for the flying boat, the chances of which overland in a forced landing were greater than those of an aeroplane over the sea. In one case in Yorkshire a flying boat was towed by horses to some water and actually got off again.

Eight rivers of over 4,000 miles' length passed through the world's markets for flying boats. The Air Department would shortly send one of the largest and latest types for a progressive trial by short stages thorugh Egypt, the Nile, the Great Lakes, the Zambesi, and the Congo, to the Cape. If it were still going then it would return.

The Trans-Atlantic Flight.

Mr. F. P. Raynham, the pilot of the Martinsyde machine, has been ready to make the Atlantic flight for some time past, but so far has been prevented by bad weather. On July 13th an attempt was made to start, the weather being favourable, but a tyre burst as the machine was being brought out of its shed.

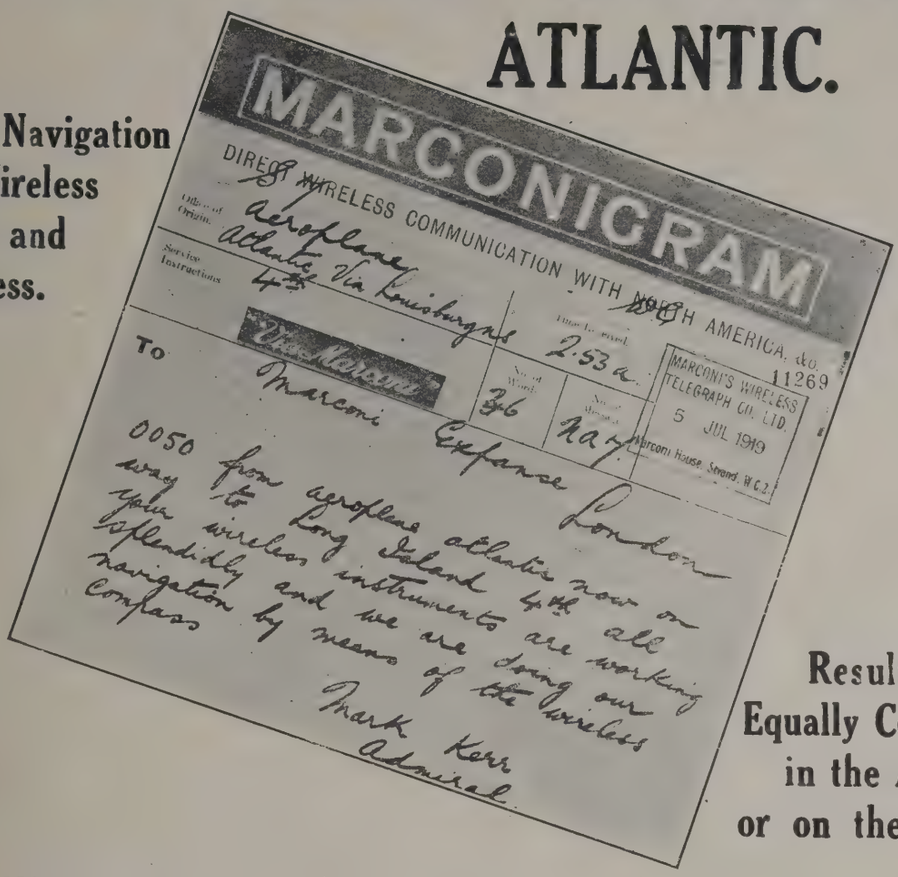
Nerve.

The following letter from a British pilot explains itself. When one considers the wholesale mess which is being made by the Air Ministry of civil aviation in this country one begins to understand, though one may not commend, the attitude of the writer:—

"I note from your issue of this week that Germany appears to be taking up aeroplane transit on a much larger scale than England at the present time, and as it is next to impossible to obtain a position in an English aviation firm unless one happens to be an ex-field officer, I am considering the advisability of offering my services to a suitable firm in Germany.

"I am fairly well acquainted with the language, and, judging from the general attitude of the German people during the period after the Armistice and up to the day of my repatriation, I am of the opinion that they would be only too pleased to foster anything in the way of friendly relations to this country.

"I am quite aware that my attitude would appear to the majority of English people as absolutely deplorable and unpatriotic, but one has to look after oneself, and I am becoming more and more convinced that the young men who have given the best part of five years in the service of the country cannot expect to receive much consideration from the Government and employers in England."



A Revised Proverb.

Apropos the many deferred attempts to leave Newfoundland, and the effects on the machines of those who do start, a correspondent suggests that there is at any rate some satisfaction in knowing that the longer the starts are deferred the longer the machines remain in flying condition.

In other words:—"Start deferred maketh the dope stick."

The WORLD of AERONAUTICS (continued)

To 49 Squadron.

Will any officers and men who were serving with 49 Squadron, R.A.F., in May, 1918, please communicate to the Editor of this paper any facts within their knowledge concerning the loss of Lieut. George Cuttle, M.C., of "C" Flight? He was brought down on the morning of May 8th just east of Bray while returning from bombing Peronne, and it is believed that Lieut. Leckie was his passenger at the time.

Ex-R.A.F. Officers' Luncheon Club.

The following letter has been received:—

Sir,—As your readers will doubtless have seen from paragraphs appearing from time to time in the daily Press, the Ex-R.A.F. Officers' City Luncheon Club has now been operating for some weeks, and, owing to rapid growth and need for larger room accommodation, recently transferred from Messrs. Pim's Restaurant in Threadneedle Street, where the Club members were very well looked after indeed, to larger premises at Messrs. Spiers and Ponds Restaurant, top floor, Mansion House Underground Railway Station.

I am constantly meeting ex-Royal Air Force Officers in the City, however, who still seem unaware of the existence of the above Club, and even go so far as to opine that there are many more similarly ignorant of such an institution.

It is for this cause I crave the hospitality of your valuable paper, feeling sure that there must be many old Royal Air Force Officers, readers of your paper, who would like to join our Luncheon Club.

We are at present 70 strong, and have our own Lunching Room, with separate tables and Smoke Room adjoining. Prospective members are always welcome, and the Club extends honorary membership to all serving officers of the Royal Air Force, and the latter appear to find it very convenient when attending the City on business from time to time.

Our Club is in no way in competition with the Royal Air Force Club, to which, in fact, most of our members also belong; but has been instituted to provide a Luncheon meeting place in the City of London for those old Air Force Officers who desire to keep up old associations and "Mess atmosphere," but are unable to spare the time to run up to the West End for lunch.

O. MODIN, late Major, R.A.F., Chairman.

Air Impotency.

An editorial article, entitled "Aircraft Impotency," in the American "Aircraft Journal," is of interest. The author writes:

"Cutting down the Army and Navy appropriations for aviation to $15,000,000 for each Service by the House Military and Naval Affairs Committees means, unless the Senate replaces some of the desired amounts, making the United States impotent in the air, crushing the airplane industry, and scrapping all experimental development begun during the war.

"The argument that these sums are enough to 'keep the Services going' until a reorganisation of the Army and Navy takes place is so fallacious that it should controvert itself. The Army needs $31,000,000 for airplanes and engines alone. Without this equipment there is nothing to 'keep going,' because all combat machines in service now would be obsolete against a first-class Air Power. Just to have the officers and men is worse than a waste of Government money.

"If money were appropriated now for the purchase of equipment which will take about a year to build, then when the Air Services are consolidated, reorganised or left as they are, this country would at least have some protective aircraft.

"The whole situation is clearly an effort to force on the country a united Air Service. Whatever arguments may be made for and against a single independent Air Force, they should be free from appropriation coercion and rest solely on their own merits.

"America's 'splendid isolation,' viewed in the light of recent aeronautic achievements, soon will be only a memory. A country that is less than a day distant from Europe and Asia cannot well rely upon the Atlantic and Pacific oceans for protection in time of stress. No longer can the Congress of the United States ignore the fact that if we are to maintain our independence and position as a first-class nation we must have aircraft inferior to no other Government. If the predominating idea on Capitol Hill is to reduce this country to the level of China, or Korea, no fault can be found with the policy now being pursued—but the plan of spending one billion dollars, too late to be of use, rather than one hundred millions, when advantage may be taken of the vast expenditures for aviation already made, will appeal to few persons outside of the House of Representatives."

Demobbed Officers and the R.A.F. Reserve.

Sir,—As a Lieut-Observer with almost three years' service with the R.F.C. in France, I have been transferred to the unemployed list of the R.A.F. Can you please enlighten me as to what this will really mean in the future.

Does it mean that when the R.A.F. Territorial Force or the R.A.F. Reserve is formed that I shall be automatically transferred to one or other of those branches or will it be necessary to make application for it?

Within the next few days I am sailing to take up a civilian position in South America and as you may easily imagine it would be a source of the greatest satisfaction to me (and doubtless to hundreds of other ex-R.A.F. men) to feel that the old country had some direct claim on us in the event of any further wars or national emergencies.

I have just studied General Trenchard's outline of the future R.A.F. in THE AEROPLANE of a week or two ago, but his remarks seem only to apply to those still with the R.A.F. and not to those who have been demobilised and placed on the "Unemployed List."

Surbiton, 19/6/19. (Signed) LIEUT.-OBSERVER.

[Perhaps the Information Department of the Air Ministry can oblige with an announcement on this point.—ED.]

A Dangerous Practice.

The following letter has been received:—

Sir,—I am writing to you, as I consider that a note in your paper *re* the following might, in the future, save several really bad accidents.

On Saturday afternoon last a red-nosed Handley Page continually "got off" from the Cricklewood Aerodrome and laboured into the air over Golders Green.

This machine flew over the closely-packed streets and houses at a height of certainly not more than 200 feet—steering into the wind, which was approximately from the north.

It was perfectly natural for the machine to be low and to climb slowly, as it was obviously well loaded; but it was only natural to expect that in such cases the pilot would have kept to the edge of the "populated area" and thus within landing distance of the aerodrome or adjacent fields.

Having been flying for five years, I know to my cost the unhappy knack that even the best engines have of stopping at the most awkward times, and if this had happened on the occasions I speak of above the result would have been appalling.

No pilot could have had the least chance of landing successfully, or in any direction except that in which he was heading, and in all probability a machine of such calibre would have obliterated four or five of the closely-built houses that this locality is made up of.

While in no way blaming the H.P. Co.—who have an aerodrome and surroundings of ample size—I cannot help considering that the pilot was not paying sufficient attention to eventualities.

An accident of this nature is going to do immense damage to flying, and also to the companies who propose to licence aerodromes which are in proximity to dwelling-houses. Town Councils will not give their consent to this, however much it is urged that "previous accidents of this nature were only caused by other firms' carelessness"!

From my own point of view I have a house which seems to be directly in the "line of attack" of these machines, and I have at present no desire to see it, my wife and family, and my neighbours, gently cleared away by an H.P. which has had momentary trouble with its petrol supply or some other "trivial" detail.—"MAJOR."

Coming Events.

JULY.

Friday, July 18th.—43rd Squadron dinner.

Saturday, July 19th.—Martinsyde Recreation Club Sports at Woodbridge Road, Guildford.

Saturday, July 19th.—Victory Meeting at Hendon. Speed Contest for Victory Trophy.

Saturday, July 26th.—July Meeting at Hendon.

Saturday, July 26th.—The Airship Officers' Club Dinner at the Connaught Rooms.

AUGUST.

Friday, August 1st.—The Amsterdam Aircraft Exhibition opens.

Saturday, August 2nd, Sunday, August 3rd and Monday, August 4th.—Tenth London Aviation Meeting at Hendon.

Tuesday, August 5th.—Handley Page Social and Athletic Club's Sports. Starting at 12 midday at Cricklewood Lane.

Thursday, August 21st.—R.A.F. Annual Athletic Meeting at Stamford Bridge.

Sunday, August 24th to Sunday, August 31st.—The "Avenir's" Tour de France Aérien.

DATES TO BE ANNOUNCED LATER.

Hendon—Birmingham—Manchester Air Race.

Hendon—Paris—Hendon Air Race.

Hendon—Brighton—Hendon Air Race.

VICKERS LIMITED

THE TRANSATLANTIC FLIGHT.

"VICKERS-VIMY-ROLLS."

THE RETURN FLIGHT OF R. 34.

H.M.A. R.34 left Mineola at 11.55 p.m. on July 9th (3.55 a.m., July 10th, Greenwich mean time) for England. The start was somewhat hurried owing to the approach of bad weather, and the ship left Mineola some hours earlier than was originally intended. The airship carried forty pounds of mails.

Some alterations were made in her crew. Lieut.-Commander Lansdowne was replaced by Lieut.-Col. Hemsley, U.S. Army, Aviation Department, and Sergts. Turner and Anders replaced Wireless Operator Edwards and the stowaway Ballantyne.

The original intention was that R.34 should land at East Fortune, but owing to bad weather the Air Ministry decided on July 12th that she would land at Pulham, Norfolk, where she eventually did land at 7.57 a.m. (6.57 a.m. G.M.T.) on July 13th. Her time was 75 hrs. 3 min., according to the ship's chronometer.

The ship was met by a motley crowd dressed in all the possible varieties of Air Service uniforms—and they are many. There were men in R.N.A.S. and R.F.C. and R.A.F. uniform, others in civilian clothes, and some partly in uniform and partly in mufti.

Hereafter follows the Air Ministry Communiqué recording the return voyage of H.M.A. R.34 from Mineola, L.I., U.S.A., to Pulham, Norfolk, England. The report is given verbatim, and any eccentricities in style or statement may be set down to the fact that it emanates from the Air Ministry after transcription from General Maitland's original :—

THE AIR MINISTRY COMMUNIQUE.

The Air Ministry state that the airship was first sighted on the north side of Pulham at 5.56 G.M.T., her position being about 15 miles away and her course almost due east. Turning south towards the Airship Station she circled over Pulham about 6.22, flying at 800 feet, landing safely at 6.56 G.M.T., exactly an hour after she was first sighted.

OFFICIAL LOG.

GENERAL MAITLAND'S STORY

The Air Ministry issued the following official log of the voyage an hour after the ship landed :—

It is a dark night and a gusty wind is blowing from the S.W., strength about 30 m.p.h. We steer straight for New York and stop as promised to fly over the city before heading out into the Atlantic. It was an extremely good "get-away" considering the gusty wind and difficult conditions generally. We find we have 4,600 gallons of petrol for the return journey.

New York at midnight looks wonderful from above. Miles and miles of tiny bright twinkly lights—a veritable fairyland. The searchlights at first make a very unsuccessful search for us, but finally get us fair and square. We are over Fifth Avenue. The "Times" Square and Broadway presents a remarkable sight. We distinctly see thousands of upturned faces in spite of the early hour, 1 a.m. of the morning, and the whole scene is lit by the gigantic electrical signs which seem to concentrate about this point—one in particular, the Overland Tower, illustrates the enormous importance of aerial advertisement. From 2,000 feet above we see its wheel revolving and the mist rising in a cloud behind it, presumably an illustration of its speed.

The air over New York feels very disturbed, partly owing to the approaching cyclone from the Great Lakes, of which we have already had warning, and partly also to the heat rising upwards from the city itself. The airship, however, rides out very steadily under the circumstances.

July 10th, Thursday, 1.10 a.m.—We head for home with 3,000 miles of sea between us and our Scottish base. The wind is now well behind and our speed makes good; it is estimated at 65 knots or nearly 74 miles per hour. Our weather at time of starting is decidedly favourable for a flight from America to England. There is a depression west of Newfoundland and then a large one centred to the north of Iceland; also an anticyclone over the East Atlantic and Great Britain. The inference from the above is that a strong south-west or west wind will prevail over the greater part of the Atlantic. We have got away on the outskirts of the depression which is centred west of Newfoundland, and are getting the full benefit of the 35-knot S.W. wind on its southerly side. At this speed we are travelling considerably faster than the depression which is probably moving eastward at about 35 m.p.h., and it may well be that we shall run right out of it by the time we reach mid-Atlantic. We then expect (it may be only a pious hope) to get into touch with the still bigger depression centred to the north of Iceland and benefit by the south-west wind which we ought to find on its southerly side.

2.17 a.m.—We are crossing the American coast with four out of our five engines running, the fifth engine resting. Some hot coffee from the Thermos flask presented us by our kind American friends is very nice and warming.

9.15 a.m.—We have already covered 430 miles from New York and are going strong. Our mails are now sorted, and this takes some time. We find we have quite a large collection of parcels and letters of all descriptions, including some for H.M. the King, the Foreign Office, Admiralty, Postmaster-General, and a large number of copies of the "Public Ledger" for the editor of the "Times." This journey we hope will prove the fastest newspaper delivery between New York and London yet accomplished, and will be the forerunner of regular interchange of mails between East and West—the Old World and the New.

10.45 a.m. G.M.T.—We are now making good 72 knots or 83 m.p.h. on four engines. The forward engine stopped. If all goes well Major

R.34 AT HOME.—The trans-Atlantic Airship Landing at Pulham. It may be noticed that her fabric looks as bulged and battered as that of the six-year-old "Hansa" Zeppelin, which was illustrated in this paper a year or more ago.

Scott will go straight for London, and we will see how long it takes us to cross the Atlantic from Broadway, New York, to Piccadilly Circus, London—from the heart of one capital to the heart of the other.

10.45 a.m.—Cooke asleep under the dining room table. (Note.—This may take our thoughts back to the days of our ancestors, but the cause of this slip and the position selected are from quite a different reason.)

12 noon.—Lunch. Cold Bologna sausage and pickles and stewed pine-apple, and a ration of rum. This latter was much appreciated, as the weather had turned much colder and lunch centred entirely. The conversation turned on the subject of obtaining secondary meteorological information in the Atlantic. Scott, Greenland, Luck, and Harris all agree that one good method of getting information at small cost would be to equip all cable repair ships with a meteorological observer and a suitable outfit of kites and instruments. These cable repair ships work in all parts of the world and are often at sea for days at a time.

Moreover, the cable routes are ready in every case on the shortest and most direct route between the countries they link up.

1.5 p.m.—We have averaged 56.3 knots per hour ever since leaving Broadway. Weather fine, visibility 15-20 miles. Wind 40 knots S.S.W., sea very rough. It is difficult from above to measure the height of waves, but it is easy to see that in a very heavy sea like this one surface ships would be having an extremely bad time. Up here we are as steady as a rock, and unless one looks out of the windows we would hardly realise we were travelling at all.

Lieut.-Col. Hemsley, U.S. Army, Aviation Dept., is steering and is taking opposite watch with Pritchard, while Lusk has relieved Greenland in the fore car, Corporal Burgess being on the elevators. We are in very good wireless communication with Sable Island, and many messages wishing us success are received from America and Canada. We send our grateful thanks to the U.S. Naval and Military Authorities for their very efficient and kind assistance in looking after the airship at Mineola during four days of difficult and unpleasant weather conditions.

4.50 p.m.—Position 42.15 N., 54 05 W., course 140 degrees steered, 110 degrees made good, 86 degrees true, 48 knots. We have covered 900 miles from New York in 16 hours, and are 1,850 miles from South Coast of Ireland, exactly one-third of the distance between the two countries.

Our petrol consumption works out at about 1 gallon an hour. Weather clear, sea deep blue; very good visibility, 35-40 miles according to the dip, and distance horizon tables at this height (1,500 feet) should be 45 miles. Cooke determined his position by observation on the sun and sea horizon. It is interesting to note that there were only two occasions when he was able to do this on the outward journey owing to clouds and fog.

6.15 p.m.—A five-masted schooner under full sail on starboard beam about five miles away was an interesting contrast between the old and the new—the sailing ship and the airship. We are now over the main east-bound summer route of steamers from New York to Queenstown. The ss. "Adriatic," due New York on 13th, should be somewhere near us, and we are on the look-out for her on the wireless. Getting much colder.

8 p.m.—Position 42.40 N., 50.30 W., making good 55 knots. Harris give most interesting explanation of the clouds formationed to the N. and S. of us, and compares the clouds as we see them with the illustrations in a different cloud text-book we have with us. It is now time for supper. Soft boiled eggs and cocoa, and we all discussed at great length our impressions of American men and American women. I wish our newly-made American friends could have heard the delightful things that were said about them. Pritchard goes to sleep under the dining-room table while the second watch comes in for their supper. This position under the dining-room table seems to be the most-sought-after point of vantage in the ship.

July 11th, Friday, 3.20 a.m.—Position 45.03 N., 42.57 W., estimated by observations on stars and sea horizon. Visibility good.

4.20 a.m.—The foremost of the two engines in aft car breaks down on connecting-rod fractures owing to bolts spearing, with the result that the crank-case gets badly notched and the engine is consequently quite beyond repair. Course making good 115 degrees or 87 degrees true. At 26 knots with forward and two wing engines. Weather clear, sea moderate.

6.40 a.m.—Altered course to N., 30 degrees E.; come down to 600 feet to get under clouds which are now appearing and threaten to block out all view of the sea completely. We now find by accurate measurements that below the clouds is a northerly wind, and above them at 3,000 feet the wind is from S.W. The reason for this is an interesting one. We are over the Gulf Stream on a north-easterly course. The air over this Gulf Stream is warmer than the air over the sea immediately to the north of it. This warm air rises and its place is naturally taken by the cold air from the north, resulting in a 12-knot convertional wind from north extending from the surface of the sea up to a height of about 2,000 feet. Having made this discovery we accordingly keep at 3,000 feet, when we have a steady wind from S.W.

8 a.m.—Cloud formations in so far as they indicate weather are like an open book profusely illustrated with a plot that changes all the time. On our port beam away to the N.W. we see the depression centred over Newfoundland written plainly in the sky in fantastic and streaky cirrus ventosus, a certain and sure indication of what is going on over there some hundreds of miles away.

9.15 a.m.—Clocks have now been put forward one hour.

10.30 a.m.—Scott and Harris are agreed that the wind is stronger in our favour the higher we go up, but in spite of that Scott decides to keep on a 3,000 ft. level to avoid necessity of losing gas from expansion which to-day is precious. To-morrow he can afford to go much higher, and the airship will be so much lighter on account of having burned another 24 hours' petrol.

12 noon.—Weather report from Air Ministry tells us of an anticyclone off S.W. of Ireland, and so we change course more to the north with a view to getting round into the westerly wind which we know must be blowing on the northerly side of it.

12.30 p.m.—Lunch. Mealtimes are always most welcome and give the more responsible members of the crew a much-needed interval. Our new gramophone is a vitally better instrument than the one we endured on the outward voyage, and as I was descending the ladder down into the fore car after lunch I just caught a glimpse of Luck and Harris doing quite a nice one-step together.

1.30 p.m.—Air Ministry sent a message to say that they had made provision to land us in Ireland if necessary, and that destroyers with steam up were available at Berehaven if required. We replied: "Propose to land at East Fortune. One engine completely broken down."

3.30 p.m.—Still at 3,000 feet in and out of the clouds at intervals. We have not seen the sea since 8.30 a.m. this morning; 1,600 revs., three engines, our speed 32 knots. Another weather report from London to say that the depression north of Iceland has moved easterly, and that as a result the wind is from south-west over North of Ireland and whole of Scotland. This strengthens Scott in his decision to give up going to London and going East Fortune instead. It is sad not to take in London on our return route, but with one engine lost and weather in South of England not very favourable the decision is a wise one.

4.30 p.m.—Scott brings ship down to try and see water and get an indication of our speed, but at 900 feet it is still very thick, so he abandons the attempt. In coming down from 3,800 ft. to 900 ft. we pass through no less than five distinct and separate cloud stratus. In these thick clouds (we have been in them now since 3.30 a.m. this morning) we have no means of telling our speed, as they extend right down to the water. We assume from general weather observations that the wind is with us, the worst condition we think fair to assume being no wind at all. There certainly ought not to be a head wind against us. There is no alternative but to keep pegging away through the clouds until other weather conditions appear.

4.45 p.m.—We appear above the clouds for a few blissful moments and see a beautiful cloud panorama. Range upon range of alternate white and slate coloured mountains with wide, deep valleys, and an occasional glimpse of bright blue sky immediately above. The glare is almost blinding, and we can only look at the sun for a moment or two at a time.

5 p.m.—We are back again in the clouds with no visibility. Picked up H.M.S. "Cumberland" on our Marconi Spark set. She gave her position, and when plotted on the chart Cooke thinks her to be almost due north of us, and from the strength of her signal she should be within 30 miles. Durrant tried to get her with our directional wireless, but without success.

7.5 p.m.—Passing through wet rain clouds. It has been raining very heavily since 5 o'clock. Scott goes up to 5,000 feet to get out of it, but with no success, and reduces height to 3,000 feet again. Very cold and dark. All windows and doors are shut.

7.35 p.m.—We ask H.M.S. "Cumberland" for a weather report. She replies giving her position and reporting wind at N.N.W., 18 m.p.h., overcast, passing showers, and clouds above 1,000 feet.

8.0 p.m.—Supper, and a very good one too. We are well equipped with little luxuries on this return voyage, having learnt a thing or two on the outward journey about what is necessary and what isn't.

8.30 p.m.—Still pouring with rain. Height 4,000 feet. The wind whistles round the forward car. Very dark and no visibility. Scott reduces height to 3,000 feet and an extraordinary sight suddenly presents itself beneath us. Thousands and thousands of little round clouds like tiny white puff balls packed closely together, with a blue sea just visible in between them, forming a layer of cloud between us and the sea. This cloud formation is called "ball cumulus."

8.45 p.m.—Dropped a calcium flare which floated away, burning brightly, straight astern, enabling Cooke to get our direction and a good idea of the speed at which we were travelling.

8.50 p.m.—Again thick clouds and heavy rain. Clifden Wireless Station sounds very loud and on the wireless, which showed we are getting nearer home, and Durrant has just succeeded in getting East Fortune 1,100 miles away. He could just faintly hear them say the words "Saturday evening."

9.15 p.m.—S.s. "Dominion" speaks us and gives her position and barometric readings. She reports us as being quite near her, though of course she cannot see us or even hear our engines owing to rain clouds.

12 midnight.—Still pouring with rain. Dropped flare; drift estimated as 10 degrees to southward. As we lay in our hammocks we listened to the rain beating pitilessly down on the outer cover of our trusty ship of the air, and our feelings, despite the weather, are those of complete confidence and security.

July 12th, Saturday, 12.45 a.m.—Weather clearing. Sea visible at 2,500 feet.

3.0 a.m.—Magnificent sunrise. The sun appeared above the clouds in a blaze of clouds, much impressing those of the crew who happened to be on duty at the time.

6.0 a.m.—Position 52.20 N., 22.35 W., 760 miles from East Fortune. Running on three engines, aft engine having broken valves. Storings changed. Air speed 32 knots. It is interesting to note that Cooke has not been able to get a single observation for plotting his position for the last 24 hours, and it is quite fair to assume that yesterday's weather with S.W. wind is quite an average day in mid-Atlantic. Clouds beneath

THE CREW OF R.34.—Major Scott, the Commanding Officer, is the central figure. The variety of R.A.F. and R.N.A.S. Uniforms is noteworthy.

us look just like a gigantic, soft, springy, fleecy white feather bed, and they fill one with a strange, irresistible feeling of wishing to jump down into them, probably a similar sort of feeling which some people feel when they are climbing a steep mountain face.

8.0 a.m.—H.M.S. "Tiger" gives her positon and reports wind N.W.-N., 15-20 m.p.h.; sky overcast with low stratus, visibility five miles. Breakfast this morning is quite a festive meal, as we reckoned it should be our last breakfast on board, and we are not quite so economical with our issues as usual. Message received from Mr. G. Constantinesco, the brilliant Rumanian inventor of Sonic transmission, welcoming us back to England.

10.55 a.m.—Height 5,000 feet. We are now over big gap in the clouds about 26 miles across, and will soon be in the clouds again. Clear blue sky and sea. No signs of a ship Making good 35 knots, which should enable us to make East Fortune at daybreak to-morrow.

11.25 a.m.—Durrant succeeds in getting a wireless out on Clifden with directional finding apparatus. Weather has turned very cold.

12 noon.—Lunch. We are all rather anxious to get to our journey's end. Perhaps it is the strain that is beginning to tell, and it is now rather disappointing to find that a N.E. wind is preventing us from making more than 28 knots. We shall be breakfasting in the air again to-morrow after all.

12.30 p.m.—The clouds have all cleared away, but only temporarily I feel certain. Height 5,000 feet, perfectly clear blue sky and deep blue sea. Visibility is at its maximum, and at this height, according to our text-books, we can see 81 miles. This means that we can see 162 miles from right forward to right aft, and the area we can see over works out at 19,200 square miles, and not a ship to be seen. My ambition to see a steamer at close quarters in this gigantic Atlantic will, I am afraid, never be realised.

3.50 p.m.—Clouds rolling up again. Some very fine examples of cumulus major are to be seen. One particularly interesting cloud formation on our port beam takes the eye. It is a huge vertical column of cloud joining a lower stratus of cloud to a higher stratus, and is about 500 feet high. It is carried by an upturned vertical current.

5.30 p.m.—Great excitement Two trawlers are sighted on our starboard beam. They look very tiny. We try and speak the near one with an Aldis lamp, but as she has no wireless we cannot get reply. We are now down to 3,000 feet, and the difference in temperature between this height and 5,000 feet is most marked, 8 degs. F. Making slightly better headway at this height, 32 knots. Wind N.N.W., 25 degs. drift, Cooke considers that an accuracy of more than 20 miles in estimating a position in mid-Atlantic cannot be guaranteed in an airship even in clear weather. Directional wireless, however, should, when perfected, make this much more accurate.

6.50 p.m.—We ran into a sudden squall from N.W. Low black clouds and a rough, confused sea all in the space of a few minutes. Ship very steady; 1,600 revs on four engines.

6.57 p.m.—Passed out of squall. Got Clifden on directional wireless. 96 degs. M.G., 75 true. We are not very far from the coast of Ireland.

7.15 p.m.—Another squall, but not a big one.

7.25 p.m.—Land in sight on our starboard bow. Great enthusiasm on board. First spotted by Lieut.-Col. Hemsley, U.S. Army Aviation Dept., seven to ten miles away. Scott alters course to make the land. Cooke gets the large chart of the west coast of Ireland, and there is keen competition to see who will fix on the exact spot when we cross the coast. Two little islands lay right ahead of us. With our glasses we see the wireless mast of Clifden. These two islands are almost certainly the same two little islands that appeared out of the fog to the delighted gaze of Alcock and Brown at the conclusion of their historical flight. A strange and happy coincidence

8.0 p.m.—At 8 o'clock precisely we crossed the coast-line a little to the north of Clifden, County Mayo, and our time from crossing the American coast at Long Island to crossing the Irish coast is exactly 61 hours 33 minutes.

8.15 p.m.—We head right in over the mountains, which at this spot are 2,900 feet high. What a wild and rugged coast-line! A magnificent cloud panorama now appears. Huge white cumulus clouds of weird and fantastic shapes surround us on all sides, and over the top peep out the tops of the mountains, while through the gaps we see lakes, harbours, islands, and green fields—quite the prettiest picture we have seen on the entire voyage. It seems as if the elements have reserved their best cloud shapes to welcome us as we cross over British soil.

9.10 p.m.—Two-seater aeroplane from neighbourhood of Castlebar flying past us and under us waving a welcome. We are now well away from the mountains over the flat country inland, heading right across to Belfast and finally East Fortune. Height 2,000 feet, making good 38 knots. Bright full moon.

Crew of R.34 on return journey:—Officers: Major G. H. Scott, A.F.C., captain; G. S. Greenland, first officer; Sec. Lt. H. F. Luck, second officer; and Lieut. J. D. Shotter, engineer officer (ship's officer); also Brig.-Gen. E. P. Maitland, C.M.G., D.S.O., representing the Air Ministry; Major J. E. M. Pritchard, O.B.E., Admiralty; Lieut.-Col. W. H. Hemsley, U.S. Army Aviation Dept.; Major G. G. H. Cooke, D.S.C., navigating officer; Lieut Guy Harris, meteorological officer; 2/Lt. R. D. Durrant, wireless officer; W. B. Mayes, coxswain; H. J. Robinson, flt. serjeant., coxswain; H. M. Watson, serjeant; R. T. Burgess, corporal; F Smith, corporal; J. Forteath, leading aircraftsman; F Borowdie, A.M., 1st Grade (last five riggers)

Engineers M. E. Gent, Flt.Sgt.; E. Ripley, Flt.Sgt.; F. A. Scull, Flt.-Sgt.; J. Shirlwell, Sgt.; B. Evenden, Sgt.; P. Cross, Cpl.; G. Gray, Cpl.; G. Graham, 1st A.M., F. Mort, 1st A.M.; J. Hortheast, 1st A.M.; R Parker, 1st A.M.; E. E. Turner, Flt.-Sgt.; W. Angers, Flt.Sgt.; H Powell, Wireless Cpl.

As things have turned out (though one could have foreseen this) it would have been wiser if we had kept a more northerly course after getting away from helpful influence of the Newfoundland depression. We would then have been helped by this N.N.W. wind instead of being hindered by it, and might have saved some time. Undoubtedly the captains of the big aerial liners of the future will become wiry and cunning masters of the art of selecting the right way and the right height, and often by making wide detours will by means of their air knowledge alone save many hours on long sea and land passages.

11.20 p.m.—Message from Air Ministry to say we are to land at Pulham. We ask if we may land at East Fortune, as that is our original objective and the weather is reported good for landing. The reply is to land at Pulham, so we assume there is some special reason and we alter our course accordingly.

Sunday, July 13th, 7 a.m.—Scott increases height to 5,000 feet, and course is steered over Isle of Man and Liverpool 2.45 a.m., Derby 3.55 a.m., and Nottingham 4.15 a.m., direct to Pulham.

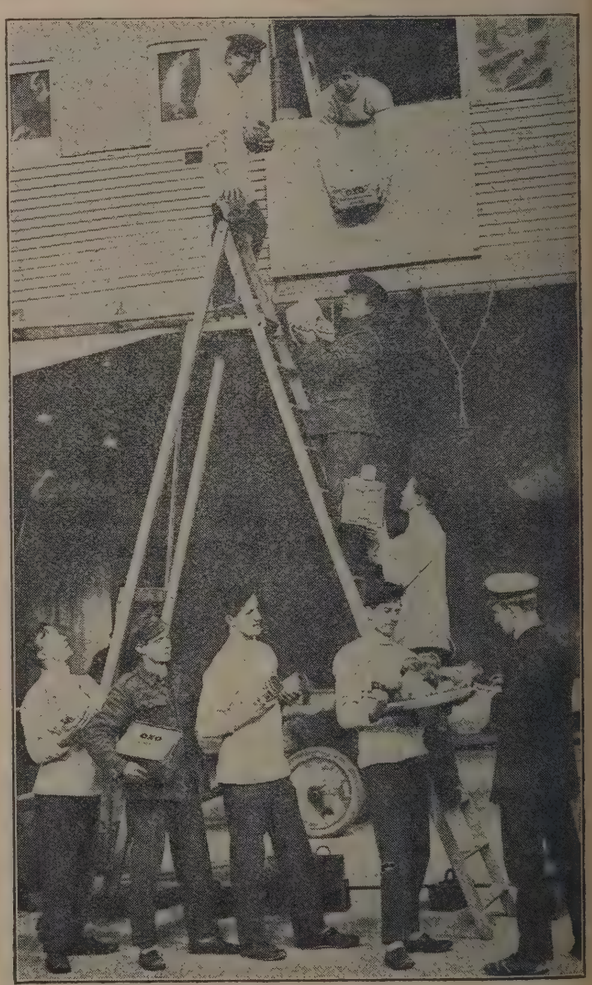
5.0 a.m.—A wireless message is received from His Majesty the King: "I congratulate you all on your safe return home after completion of your memorable and indeed unique trans-Atlantic voyage."—(signed) G. R. Wireless messages of congratulations were also received from Major-Gen. Seely, Under Secretary of State for Air; Major-Gen. Sir H. M. Trenchard, Chief of Air Staff; Major-Gen. Sir F. H. Sykes, Controller-General of Civil Aviation, and Sir A. Robinson, Secretary of the Air Council.

6.20 a.m.—Over Pulham Airship Station, and 6.57 landed. Total time of return journey from Long Island to Pulham, Norfolk, 75 hours 3 minutes, or 3 days 3 hours 3 minutes

The mail safely brought by the R.34 from America was in a crash on Sunday, July 13th, whilst being conveyed to London in a motor-car. The car contained, among others, Lieut.-Commander Ramsey, of the U.S.N.A.S. It collided with a horse and trap at the village of Capel St. Mary, near Ipswich, killing the horse, and injuring all the travellers except Lt.-Com. Ramsey.

General Maitland, Major Scott, and Lieut. Shotter arrived in London during the morning of July 14th, and were met at Liverpool Street Station by representatives of the Air Ministry.

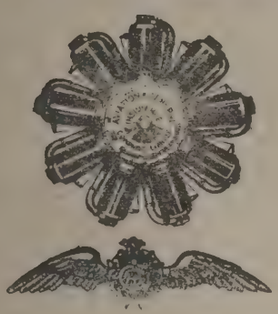
Mrs. Winston Churchill was present with Lady Drogheda. The War Minister was represented by Colonel Scott, General Sykes by General Swinton, and General Trenchard by Colonel Chamier. Among others on the platform were General Masterman (chief representative of the Airship Service), Commander Perrin (secretary of the Royal Aero Club), Commander Ramsey (of the U.S.A. Navy), and a number of R.A.F. officers who were connected with the arrangements for the flight.



Afterwards General Maitland and Major Scott were entertained at luncheon at the House of Commons by General Seely.

SLEEPY AMERICA.

According to the New York correspondent of the "Daily Telegraph," "there is a summer rush of patriots in the correspondence columns of the American newspapers, protesting against what is called by most of them the 'supineness of the naval authorities in allowing other countries to eclipse the United States in regard to aviation.'



"After allowing for the flying-boat's success in reaching Europe *via* the Azores and Portugal, it is declared that we here are lagging behind England very seriously, and, though the aeroplane is an American invention, we permit you to ride over us roughshod.

"The British proposals to establish lines of commerce and passenger-carrying dirigibles are studied here, and the 'New York Times,' which is not a sensational paper, comments to-day: 'John Bull is hard-headed and business-like. He is set on being master of the air. What is Uncle Sam going to do about it?'"

VICTUALLING R.34.—The scene and the variety of comestibles somehow remind one of Chu-Chin-Chow, and the Steward's song of "Sardines stewed in honey, Also fricasseed sturgeon roe,"—or words to that effect

UTILITY AIRCRAFT

THE machine illustrated above is the B.A.T., F.K. 26, a dual purpose aeroplane equally suitable as a heavy load mail carrier or a four-seater touring machine. Equipped with a Rolls-Royce Eagle VIII. motor, an average speed of over 120 miles per hour is obtained at a fuel cost of under eightpence per mile.

THE aim behind all B.A.T aircraft designs is the attainment of maximum utility—it is to obtain superior speed, load carrying capacity, safety, reliability, and general airworthiness with a minimum of prime cost and subsequent maintenance.

Our range of models covers all types from the mosquito craft of extreme performance and attacking power for national defence, to the high speed load carrier designed for postal and general utility purposes.

Any Government or commercial undertaking intending to employ aircraft should place their requirements before the B.A.T. Company before finally deciding on the type to adopt.

Fullest particulars can be obtained, and demonstrations arranged, by application to:—

THE B.A.T. Company whose designing capacity under the direction of Mr F. Koolhoven is of the highest standard — a standard which it is determined to maintain—is open to negotiations for the letting of its sole manufacturing licenses in Colonial and certain foreign territories.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

A contributor, "Strasbourg," whose articles on the "Influence of Official Control on Aeroplane Design" attracted considerable attention early in this year, contributes to this number a rather depressing article concerning the probable effect of continued official control upon the future prospects of aeronautical engineers in this country.

It seems fairly clear either that "Strasbourg" has suffered somewhat at the hands of more than one Government, or that he possesses the Irish characteristic of being always "agin the Government."

At the same time his advice to the younger generation of aeronautical engineers to fill in the interval between the present time and that time to come when they can be reabsorbed into the aeronautical industry by widening their experience of general engineering is very sound.

The more recent machines designed and built by the British and Aeroplane Company, Ltd., of Bristol, are the subject of this week's instalment of "Modern British Aeroplanes."

Mr. C. W. Tinson replies briefly to Mr. J. D. North's criticism of the articles on "Longitudinal Stability" (p. 248).

THE AERONAUTICAL ENGINEER AND THE FUTURE.

By "STRASBOURG."

Aeronautical engineering is the most recent of the branches of the engineering profession.

Six years ago the aeronautical engineers of Britain might almost have been counted on the fingers—if one confined oneself to those whose training gave them a right to be called engineers, and whose achievements gave them a place in the world of aeronautics.

Wild and woolly inventors there were, of course—numberless as the sands of the seashore—and many of them would have described themselves as being both aeronautical and engineers (of sorts), presumably basing their claims to the substantive part of the title on the ground that an engineer was merely an ingenious person.

But the real aeronautical engineers of those early days were all enthusiasts, working for the love of the craft and for no visible material reward. Many of them are still with us, and many of them by the unlikeliest of chances have reaped a reasonable and richly deserved reward for the labours and struggles of those early and very lean years. Some of them have not yet received any other reward than that of seeing some of their dreams realised, and some have passed beyond the hope of earthly reward.

But there are now in this country some thousands of people, all more or less rightly to be considered as engineers, who either through service with one or other of varied forms which His Majesty's Aerial Forces have assumed, or by virtue of a connection with the war-expanded Aircraft Industry, can claim also the prefix "aeronautical."

The war-time activities of the Air Force, and with them those of the Aeroplane Industry, have ceased—for a time at least.

The Commercial Aviation Industry of the future is not, as yet. Its destinies lie largely in the hands of a Government Department—a department closely allied with that Bolo House which is, and largely deserves to be, a by-word for all that is inconsequent and impedant—though in places pedantic—in a system of government notorious for its incapacity efficiently to perform any function.

This department is without funds—£500,000 per annum is practically nothing wherewith to lay the foundations of Civil Aerial Transport in the British Empire—and apparently without power, since apparently the least word of the most incompetent jackass in office of the Military Branch of the Air Services suffices to immobilise it.

In Britain it has ever been thus. The public supply of gas, of electricity for power and lighting, the installation of electrical tramways, and the development of road motor transport have all in their turn been subject at their birth to hampering restrictions imposed by a Government Department improvised to that end, ostensibly for the protection of a public too stupid to take care of itself, and in practice to retard in every possible way those developments of applied science which pass beyond the comprehension of the average member of Parliament.

Thus it occurs that the British public services—gas, water, electricity, telephones, telegrams, and the like—are to some very considerable extent the laughing-stock of the engineering world, and are only saved from utter futility by that genius for attaining, by hook or by crook, some sort of useful result under the most unpromising conditions which is now and ever has been the distinguishing feature of the British professional classes, and upon which alone, despite all the efforts of politicians, lawyers, and the trading class generally (politicians and lawyers being merely traders in credulity), the prosperity and power of the British Empire depends.

As it has been in the past so is it likely to be in the future. It is unthinkable—we being by our works proclaimed a nation of fools—that we should depart from our foolishness in this one matter alone, and it must be

accepted that the progress of commercial aviation in this country will be retarded by official action and regulation based upon every possible plea as to the safety of the public, the rights of property, the interests of local authorities, *et hoc genus omne,* and that its future will depend entirely upon the efforts that are made by those who may properly be classed as aeronautical engineers to overcome the ill effect of these artificial handicaps to the growth of what is destined to become one of the main channels of the civilisation of the future.

The conditions under which British engineers have had to do their work, particularly in those branches which have been more directly subjected to Government interference, have had their indirect advantages. The engineer who can successfully contend with the British Board of Trade, Local Government Board, or the like, and, in spite of their efforts, successfully operate a gas, electricity, tramway, or railway undertaking in this country, can generally rise to eminence and affluence if he betake himself to some region where enterprise is less subject to official obstruction.

This condition will almost certainly recur in the case of Aeronautical Engineering, but it is by no means desirable for the future of the British Industry that any very large proportion of the younger and more enterprising of our aeronautical engineers should be forced out of the country in a search for a bare subsistence.

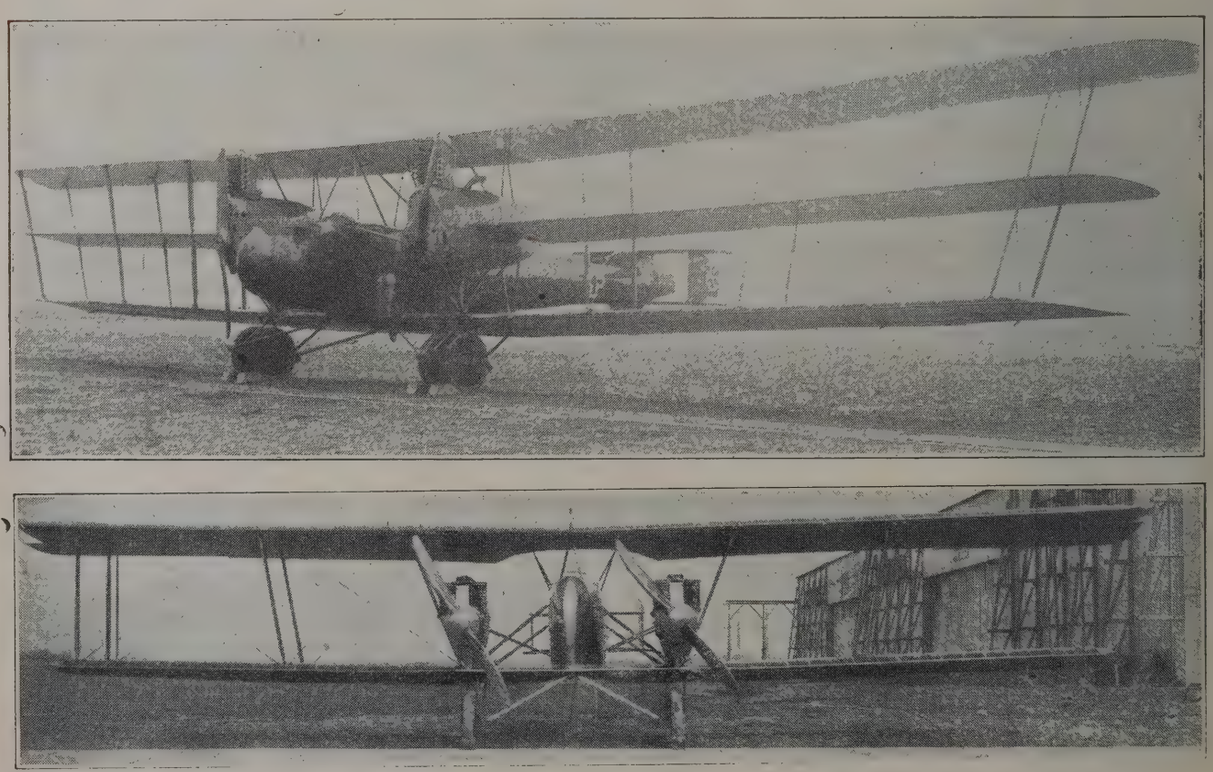
At the moment the professional prospects of the large number of young men who, during the past four or five years, have been trained either in the Services or out of it to the practice of engineering as it applies to aeronautics are by no means bright.

The commercial side of the Aircraft Industry has no room for them. If they really have the makings of true engineers in them, the Royal Air Force is totally incapable of using them, and, anyhow, does not like that particular brand of human being.

The man who really succeeds as an engineer is usually deeply interested in his profession, and such an interest is often just as incompatible with the cultivation of those social graces and that careful regard for ceremonial which it is understood is now to be cultivated by the Royal Air Force, as it was with that general lack of any order which has characterised that Force in the past.

Therefore one is forced to conclude that there is not at this time and in this country any opening within the Aircraft Industry for a large number of men who have a fairly extensive training which would fit them for such work.

The Commercial Aircraft Industry of the future will need these men, or others to take their place, but it cannot at present support them.



There appears to be but one hope.

Aeronautical Engineering is but one specialised branch of engineering generally, and no man is fitted for a responsible position in any branch of engineering whose practical knowledge is entirely confined to that special branch.

Most of the younger aeronautical engineers are purely war-time forced products of an intensive training system which has confined itself to within very narrow limits.

The general engineering industry of the world is just at the moment slack, but there are unlimited arrears of work to be made up within the next few years, and there will be room therein for every man with any engineering ability who is not afraid of work.

Therefore one would unhesitatingly advise all those of the class referred to above, who wish to play a part in the future of British Aeronautical Engineering, but who cannot find places for themselves in that profession at the moment, to seek for themselves work in any branch of mechanical engineering, particularly in the realm of structural and general transport work, and to look upon such work, not as a temporary break in their aeronautical careers, but as a part of that wider training which is really the true distinction between an engineer and an educated tradesman

TWO MODERN GERMAN MACHINES.—Top: An L.V.G. twin-engined Triplane. Below: An Aviatik with two 230 h.p. Berz engines. The general "cleaning up" of the lines of these machines as compared with the early Gothas and Friedrichshafens is notable.

MODERN BRITISH AEROPLANES.

VIII.—The British and Colonial Aeroplane Co., Ltd.

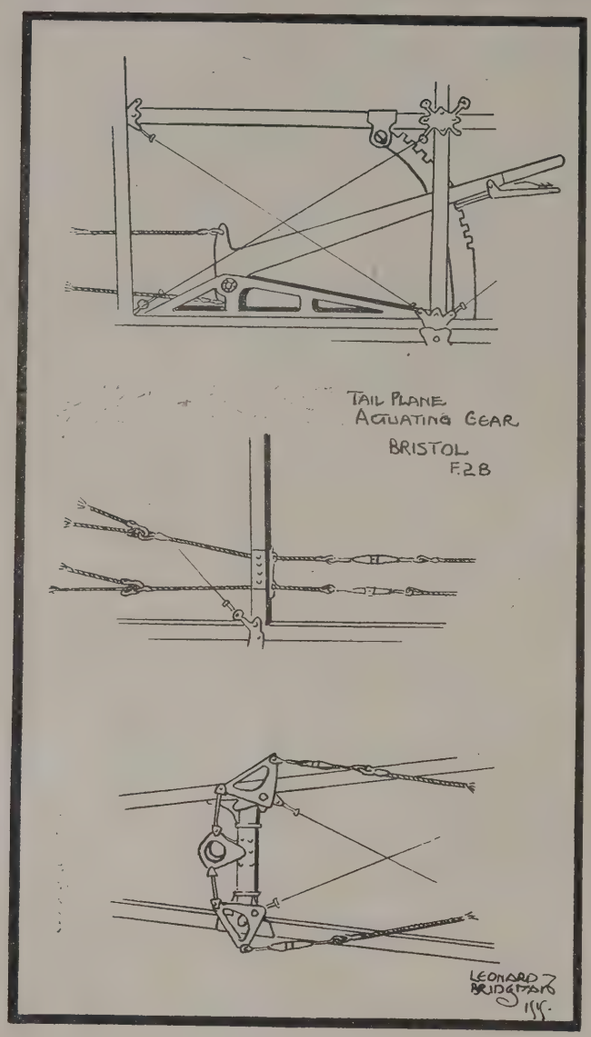
Founded in 1910 by the enterprise of the late Sir George White, the names of the British and Colonial Aeroplane Co., Ltd., and of their products, the "Bristol" aeroplanes, are indissolubly connected with the development of the British Aeroplane Industry.

Many of the finest of the early British pilots learnt to fly upon Bristol aeroplanes, and the firm has always been noted for the excellence of their workmanship.

At the beginning of the war the Bristol "Bullet" was one of the most serviceable of the small high-speed single-seaters in the Allied Air Services, and the succeeding machines of that mark have signally upheld the firm's reputation

During the whole period of hostilities the design work of the firm has been in the charge of Capt. F. S. Barnwell, R.A.F.

The following illustrations and descriptions relate to those of the firm's products which have made their appearance since the commencement of hostilities.



Illustrations of nearly all these machines have appeared in THE AEROPLANE quite recently, and in some cases—as in that of the type F.1 Scout—no new pictures are available.

THE BRISTOL F.2B. BIPLANE.

The Bristol F.2B. biplane, more commonly known as the Bristol "Fighter," was designed as a fighter and reconnaissance two-seater biplane. The fuselage is square section and tapers to a horizontal knife edge aft. A Rolls-Royce "Falcon" engine is carried in the nose of the machine on steel tube engine bearers, with the radiator in front. Metal cowling covers the front of the fuselage as far back as the front top and bottom centre section struts, and the top of the fuselage back to the pilot's seat. The fuselage is slung midway between the planes, there being both top and bottom centre-sections.

A Modified Bristol Fighter fitted with enclosed Passenger Cabin.

The angle of incidence of the tail plane can be altered from the pilot's seat to offset varying weights carried. Partial dual control is fitted, the control column being duplicated in the observer's cockpit, but for the rudder control instead of the rudder bar two hand-grips are fitted to the rudder control wires which pass through the observer's cockpit.

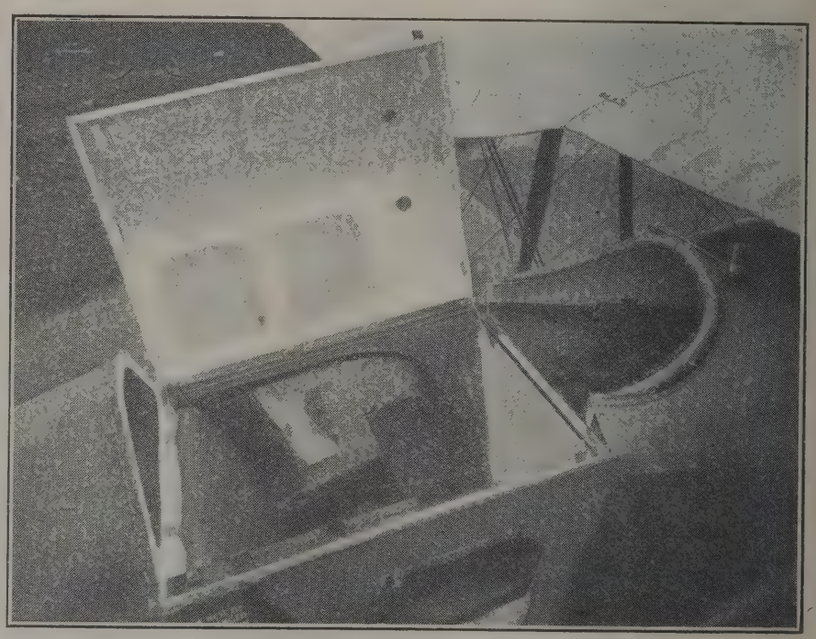
The armament consists of one fixed Vickers gun inside the cowling, firing through the airscrew, and a Scarff mounting round the observer's cockpit which is capable of carrying either the single or twin Lewis guns. The 200-h.p. Sunbeam "Arab" and the 200-h.p. Hispano-Suiza engines have been fitted and used on active service in substitution for the 250-h.p. Rolls-Royce "Falcon."

SPECIFICATION.

Type of machine—Two-seater Biplane.
Name or type No. of machine—F.2b.
Purpose for which intended—Fighting and Reconnaissance.
Span—39 ft. 3 in.
Gap—5 ft. 5 in.
Overall length—25 ft. 9 in.
Maximum height—10 ft. 1 in.
Chord—5 ft. 6 in.
Total surface of wings—405 sq. ft.
Total area of tail—22.2 sq. ft.
Area of elevators—23.2 sq. ft.
Area of rudder—7.2 sq. ft.
Area of fin—10.7 sq. ft.
Engine type and h.p.—Rolls-Royce Falcon III, 260 h.p.

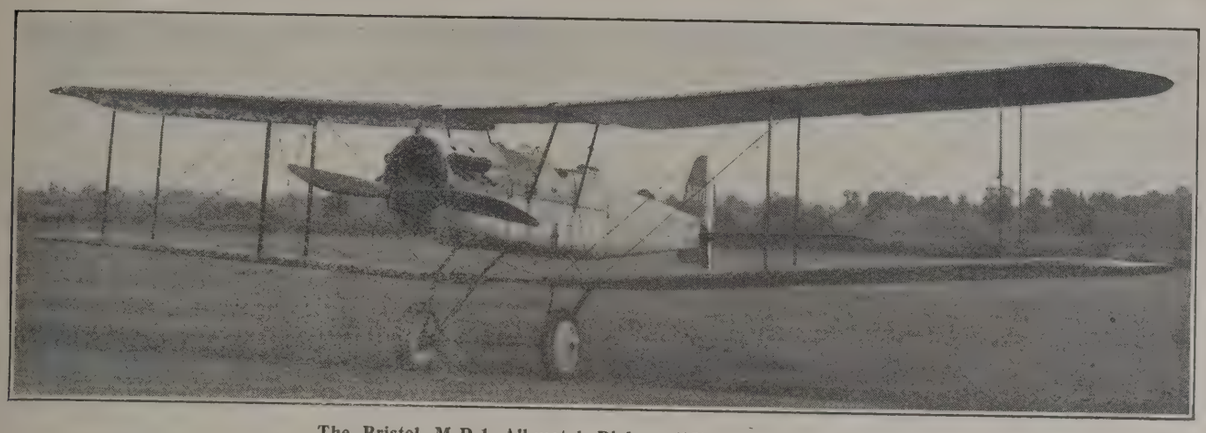
Airscrew	9 ft. 8 in. diam.; 9 ft. 4 in. pitch; 1,220 r.p.m.
Weight of machine empty	1,750 lbs.
Load per sq. ft.	6.92 lbs.
Weight per h.p.	10.6 lbs.
Petrol tank capacity	45 gallons.
Oil tank capacity	4 gallons.
PERFORMANCE—	
Speed low down	125 m.p.h.
Speed at 5,000 feet	122 m.p.h.
Speed at 10,000 feet	113 m.p.h.
Landing speed	48 m.p.h.
Climb—	
To 5,000 feet	5 minutes.
To 10,000 feet	11.5 minutes.
To 15,000 feet	21.5 minutes.
Disposable load apart from fuel	630 lbs.
Total weight of machine loaded	2,800 lbs.

THE BRISTOL MONOPLANE.



Contrary to the usual run of single-seater fighting machines, the majority of which pertain to the biplane breed, the British and Colonial Aeroplane Co., designed a monoplane which possessed a very good all-round performance, and which was used on active service in the Eastern theatre of war with great success.

The fuselage is of circular section, the shape of the cowling being preserved down to the tail plane by fairing composed of formers and laths covered with fabric. A 110-h.p. Le Rhône forms the power unit and a large circular spinner is fixed to the propeller.



The armament consists of one fixed Vickers gun firing through the airscrew.

SPECIFICATION.

Type of machine	Single-seater Monoplane.
Name or type No. of machine	Bristol Monoplane.
Purpose for which intended	Fighting.
Span	30 ft. 9 in.
Overall length	20 ft. 4 in.
Maximum height	8 ft.
Chord	5 ft. 11 in.
Total surface of wings	145 sq. ft.
Total area of tail	20 sq. ft.
Area of elevators	15 sq. ft.
Area of rudder	4.5 sq. ft.
Area of fin	5 sq. ft.
Engine type and h.p.	110-h.p. Le Rhône.
Airscrew	8 ft. 6 in. diam.; 8 ft. 11 in. pitch; 1,350 r.p.m.
Weight of machine empty	850 lbs.
Load per sq. ft.	8.9 lbs.
Weight per h.p.	10.8 lbs.
Petrol tank capacity	20 gallons.
Oil tank capacity	5 gallons.
PERFORMANCE—	
Speed low down	130 m.p.h.

The Cabin of the "Limousine" Bristol Fighter.

The Bristol M.R.1 All-metal Biplane (170 h.p. Hispano-Suiza engine).

Speed at 5,000 feet	127 m.p.h.
Speed at 10,000 feet	117 m.p.h.
Landing speed	49 m.p.h.
Climb—	
To 5,000 feet	3.5 minutes.
To 10,000 feet	9.0 minutes.
To 15,000 feet	19.0 minutes.
Disposable load apart from fuel	260 lbs.
Total weight of machine loaded	1,300 lbs.

THE BRISTOL ALL-METAL M.R.1. BIPLANE.

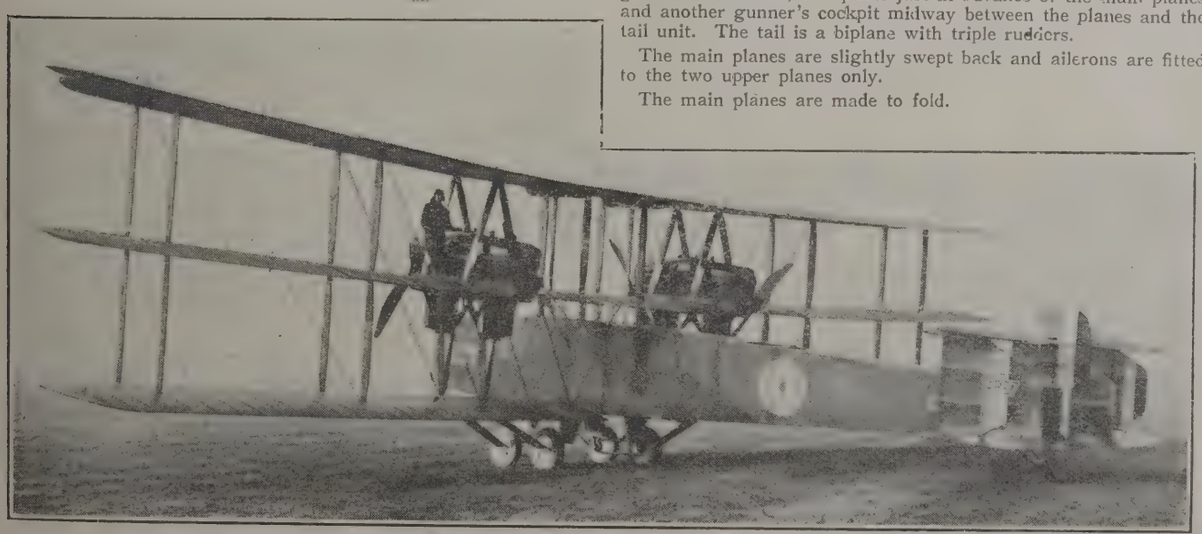
The Bristol all-metal biplane is more or less an all-metal Bristol "Fighter" with sundry modifications and was designed primarily for use in countries where extremes of heat and cold might have a detrimental effect on woodwork.

Metal has entirely replaced wood in the construction, and the fuselage being constructed of aluminium and steel can be easily dismantled for transport and storage purposes. The wings, which are unstaggered are of all-steel construction. The fuselage is slung between the planes, as in the Bristol "Fighter," but the lower centre section is completely cut away, leaving the two main spar tubes, to which are attached the two lower centre section struts.

SPECIFICATION.

Type of machine	Two-seater Biplane.
Name or type No. of machine	All-Metal M.R.I.
Purpose for which intended	Fighting and Reconnaissance.
Span	42 ft. 2 in.
Gap	5 ft. 11 in.
Overall length	27 ft.
Maximum height	10 ft. 3 in.
Chord	6 ft.
Total surface of wings	458 sq. ft.
Total area of tail	27.8 sq. ft.
Area of elevators	30 sq. ft.
Area of rudder	8.25 sq. ft.
Area of fin	7.8 sq. ft.
Engine type and h.p.	170-h.p. Wolseley "Viper,"
Airscrew	8 ft. 10 in. diam.; 5 ft. 7 in. pitch; 1,700 r.p.m.
Weight of machine empty	1,700 lbs.
Load per sq. ft.	6.13 lbs.
Weight per h.p.	16.5 lbs.
Petrol tank capacity	50 gallons.
Oil tank capacity	5 gallons.
PERFORMANCE—	
Speed low down	110 m.p.h.
Speed at 5,000 feet	106 m.p.h.
Speed at 10,000 feet	98 m.p.h.
Landing speed	47 m.p.h.
Climb—	
To 5,000 feet	8 minutes.
To 10,000 feet	20 minutes.
Disposable load apart from fuel	630 lbs.
Total weight of machine loaded	2,810 lbs.

THE BRISTOL TRIPLANE "BRAEMAR" MARK II.

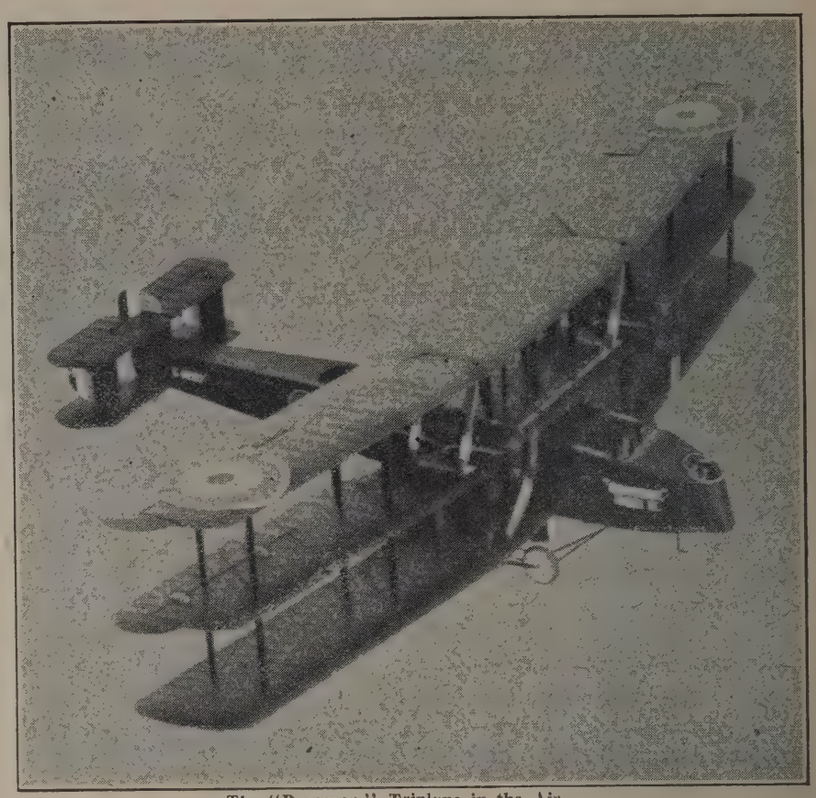


The Bristol "Braemar" was originally designed as a long-distance bomber, but owing to the Armistice coming when it did the machine was never used on active service. It is now being slightly modified to do duty as a passenger-carrier and commercial machine.

It is a four-engined triplane with a single fuselage and with the four engines fixed in pairs tandem-wise driving two tractors and two pushers on either side of the fuselage.

In its original form the fuselage had accommodation for one gunner in the nose, two pilots just in advance of the main planes and another gunner's cockpit midway between the planes and the tail unit. The tail is a biplane with triple rudders.

The main planes are slightly swept back and ailerons are fitted to the two upper planes only.

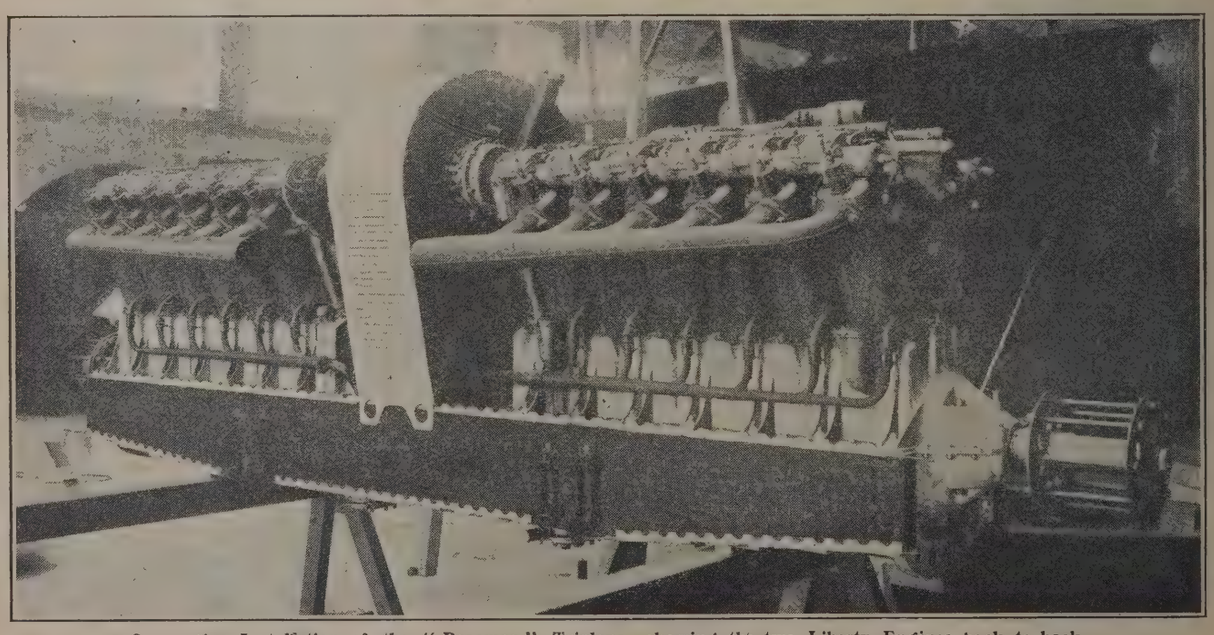


The main planes are made to fold.

Three-quarter Rear View of the Bristol "Braemar" Triplane (four 400 h.p. Liberty engines).

SPECIFICATION.

Type of machine—Four-engined Triplane.
Name or type No. of machine—"Braemar" Mark II.
Purpose for which intended—Bomber or Passenger-carrier.
Span—Top, 81 ft. 8 in.; centre, 81 ft. 8 in.; bottom, 78 ft. 3 in.
Gap—7 ft. 2⅛ in.
Overall length—51 ft. 6 in
Maximum height—20 ft. 8 in.
Chord—8 ft. 6 in.
Total surface of wings—1,905 sq. ft.
Total area of tail—Top, 51.5 sq. ft.; bottom, 45 sq. ft.
Area of elevators—Top, 42.5 sq. ft.; bottom, 42.5 sq. ft.
Area of rudder—25 sq. ft.
Area of fin—28.2 sq. ft.
Engine type and h.p.—Four Liberty engines. 1,640 h.p. (total).
Airscrew—Front (two), 10 ft. 2 in. diam.; 6 ft. 11 in. pitch; rear (two), 9 ft. 2 in. diam.; 7 ft. 5 in. pitch; 1,750 r.p.m.
Weight of machine empty—10,650 lbs.
Load per sq. ft.—8.6 lbs.
Weight per h.p.—10 lbs.
Petrol tank capacity—450 gallons.
Oil tank capacity—40 gallons.
Performance—
Speed low down—125 m.p.h.
Speed at 5,000 feet—122 m.p.h.
Speed at 10,000 ft.—113 m.p.h.
Landing speed—55 m.p.h.
Climb—
To 5,000 ft.—6 minutes.
To 10,000 feet—13 minutes.
Disposable load apart from fuel—1,940 lbs.
Total weight of machine loaded—16,500 lbs.

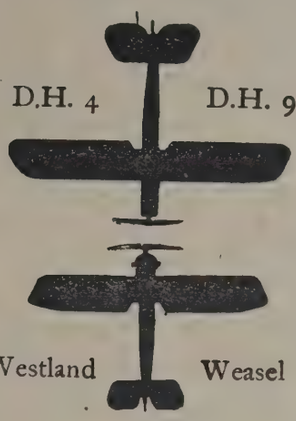


The "Braemar" Triplane in the Air.

THE BRISTOL SCOUT, TYPE F.1.

The Bristol scout, type F1, is a recent production of the Bristol firm and was about to be put in production when the Armistice was signed. The fuselage is very deep and carries in its nose a 200 Sunbeam "Arab." The main planes show the principal departure from standard Bristol practice in that the lower plane is of smaller chord than the upper one so as to improve the pilot's range of vision downwards. One set of three struts, in the form of an N, are fitted on either side of the fuselage and are inclined outwards from the base. Ailerons are fitted to the upper plane only The tail plane and undercarriage are of normal type. Armament consists of two fixed Vicker's guns fitted on top of the fuselage and firing through the propeller with the usual form of fire-control gear. The machine shows a speed of 128 m.p.h. at 10,000 feet, to which height it climbs in 8½ minutes.

SPECIFICATION.



Type of machine	Single-seater Biplane.
Name or type No. of machine	Scout F.1.
Purpose for which intended	Fighting and Reconnaissance.
Span	Top, 29 ft. 6 in.; bottom, 26 ft. 2 in.
Gap	5 ft. 1 in.
Overall length	20 ft. 10 in.
Maximum height	8 ft. 4 in.
Chord	Top, 5 ft. 7 in.; bottom, 4 ft. 11 in.
Total surface of wings	260 sq. ft.
Total area of tail	15 sq. ft.
Area of elevators	14.5 sq. ft.
Area of rudder	5 sq. ft.

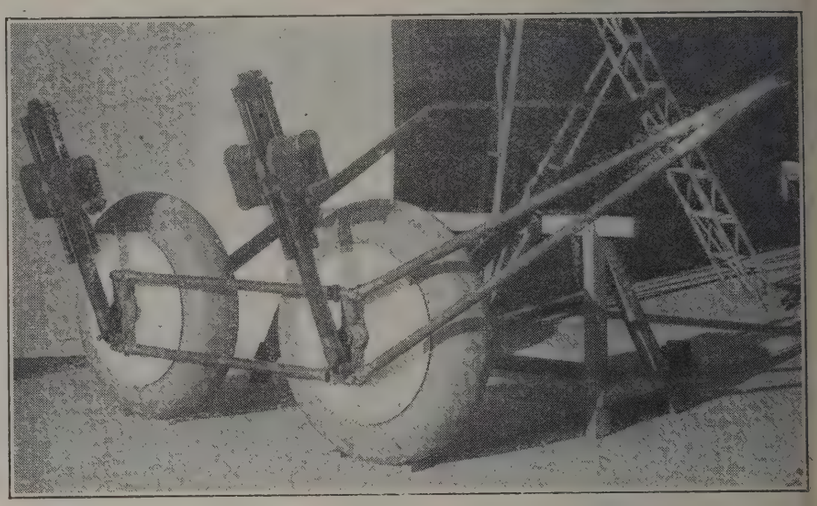
Rear View of the "Braemar" Triplane.

Area of fin—4.1 sq. ft.
Engine type and h.p.—200 h.p. Sunbeam "Arab."
Airscrew—9 ft. 2 ins. diam.: 9 ft. pitch; 1,155 r.p.m.
Weight of machine empty—1,300 lbs.
Load per sq. ft.—8.08 sq. ft.
Weight per h.p.—10 lbs.
Petrol tank capacity—32 gallons.
Oil tank capacity—5 gallons.



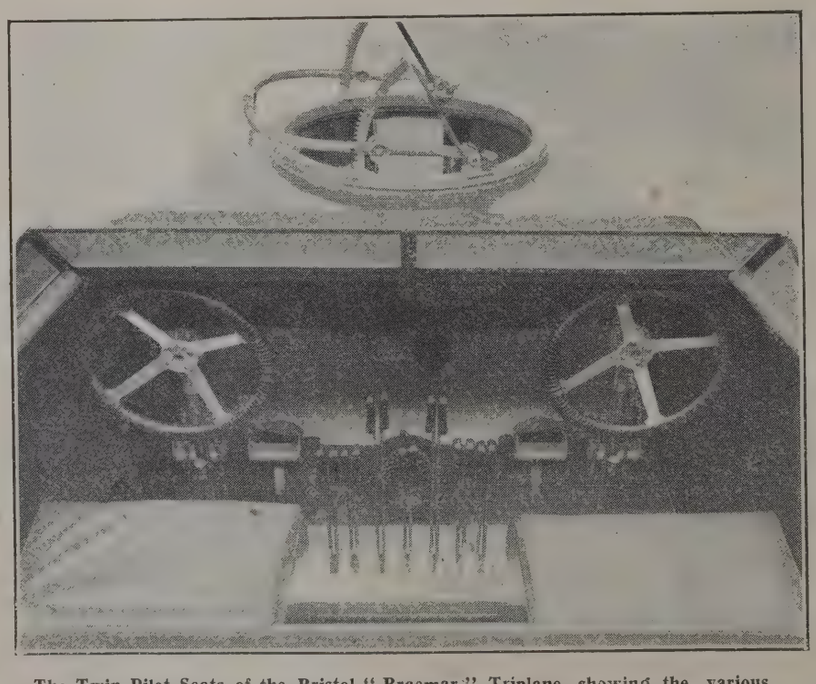
Performance—

Speed low down—138 m.p.h.
Speed at 5,000 feet—135 m.p.h.
Speed at 10,000 feet—128 m.p.h.
Landing speed—49 m.p.h.

Climb—

To 5,000 feet—3.7 minutes.
To 10,000 feet—8.5 minutes.
To 15,000 feet—16 minutes.

Disposable load apart from fuel—450 lbs.
Total weight of machine loaded 2,100 lbs.



One Side of the Chassis of the "Braemar" in skeleton form.

A later edition of the machine has been fitted with a Cosmos "Mercury" engine of 315 h.p., and has given very fine performances therewith

THE BRISTOL "BADGER."

In addition to the machines described above, the Bristol firm have recently produced a small two-seater of high performance, known as the "Badger," of which no particulars are available beyond the fact that one has been fitted with the Cosmos "Jupiter" engine of 450 h.p.

The Twin Pilot Seats of the Bristol "Braemar" Triplane, showing the various controls for the throttles, switches, altitude regulator, magneto advance and retard, for the four engines.

A photograph of this machine in the air is given on page 248, from which it may be seen that the machine is a small single bay machine generally similar to the type F.1 single-seat Scout.

It is understood that this machine is of roughly 35 ft. span, and that the total weight loaded is a little under 3,000 lbs., and that it has reached a speed of about 140 m.p.h.

It is hoped to describe this machine in detail at an early date

THE STANDARDISATION OF CHAINS.

The demands made by the Allied Governments for driving chains for all purposes during the war made it necessary for the British Driving Chain Manufacturers to collaborate. The benefits accruing from the co-operation were so marked that a permanent Association has now been formed to standardise chains, and to keep down the cost of chain driving to face competition with other forms of transmission.—The members are:—The Alfred Appleby Chain Co., Ltd.; Brampton Bros., Ltd.; the Coventry Chain Co., Ltd.; and Hans Renold, Ltd.

LONGITUDINAL STABILITY.

The following letter has been received :—

Sir,—In reply to Mr. J. D. North's criticism of my notes on Longitudinal Stability, I quite agree that in a dive at limiting speed a main-plane moment of importance is present, but do not follow his remark concerning equilibrium in this condition.

I think it is perfectly clear that in my treatment equilibrium is maintained at one speed only, a speed initially fixed by the designer, and the object of my investigation was specially to find a way of determining the combination of area and angle of the tail, such that at any other speed, and with the C.G. in any position within reason, there would be a couple present which would tend to restore the machine to the attitude corresponding to this speed of equilibrium.

I rather took it for granted that in a nose dive the case would be O.K. as far as couple was concerned, but I wished to emphasise the fact that a small tail set to a large angle would be subjected to a great increase of pressure, and the loading in a dive might easily be excessive, whilst in each case other than diving the tail might be quite satisfactory.

The opening paragraph in this section of the notes reads: " . . . for if the loading is too high under these conditions a lower value (of loading) will have to be substituted and new value obtained for area and angle."

I should greatly appreciate criticisms from other designers, and if there are points which they regard as misleading, would they please give chapter and verse, as up to the present I have found the method gives very good results.

(Signed) CLIFFORD W. TINSON.

INDUSTRIAL RECONSTRUCTION AND THE POPULACE.

The Industrial Reconstruction Council, the chairman of which is Mr. Ernest Benn, is doing its best to inculcate a proper spirit into both employers and workpeople in these days, in accordance with the policy of the Rt. Hon. J. H. Whitley, M.P., the originator of the famous Whitley Trade Councils.

In support of this policy the Industrial Reconstruction Council is organising a series of meetings at Tower Hill, a locality which has hitherto been devoted either to executions or to agitations. These meetings take place every Monday at 1 o'clock, so as to catch the City workers during their lunch hour. Last Monday, for example, the speaker was Col. Alan Burgoyne, M.P., who has been considerably concerned with aviation.

It is also of interest to note that on the Executive Council of the I.R.C., the chairman is Lieut.-Col. C. L'Estrange Malone, M.P., late Wing Commander R.N.A.S., and among the members are Sir Charles Allom, of the Gosport Aircraft Company; Mr. Wilfred Hill, of the County Chemical Company, Birmingham, who has long been interested in Aircraft; Sir Alexander Roger, formerly of the Ministry of Munitions, who has also done good work for the Flying Services; and Mr. H. V. Roe, late Lieut. R.A.F. and formerly of A. V. Roe & Co., Ltd. So that there is considerable aircraft interest in the Council.

These meetings should be worth attending.

The Bristol " Braemar " and the " Limousine," taken from a Bristol Fighter.

AN AERONAUTICAL CORRESPONDENCE SCHOOL.

A correspondence school dealing entirely with Aeronautical subjects has been opened at Harrow by Capt. Herman Shaw, B.Sc., A.R.C.S., A.F.R.Ae.S., late R.A.F., since his demobilisation from the R.A.F.

In addition to active service work with seaplanes and other machines on patrols over the North Sea, Capt. Shaw was for some considerable time employed as an instructor and lecturer on the theory of Flight and similar subjects by the R.N.A.S.

Capt. Shaw has secured the services of two other ex-R.A.F. officers, Capt. A. H. Munday and Lieut. J. FitzGerald to assist in the operations of the school.

Inquiries relating to the various courses of instruction offered should be addressed to the Harrow College of Aeronautics, Pinner Road, Harrow.

AMERICAN AIRCRAFT IN EUROPE.

Mr. F. G. Diffin, president of the United Aircraft Engineering Corporation, 52, Vanderbilt Avenue, New York, left New York on the " Baltic " on July 1st and should by now be in London. He is making this trip for the purpose of establishing a London branch and of taking up various matters pertaining to commercial aviation with London manufacturers. He will stop at the Savoy Hotel. This information may be of interest to the British Aircraft Industry.

THE PATENTS INDEX.

The subjoined list of recent inventions has been specially compiled by THE AEROPLANE from the Current Official Patents Records :—

TRANS-ATLANTIC MAGNETOS.

To those who are still of the opinion that the only good magnetos are German magnetos, it will be of interest to note that the Sunbeam-Coatalen engines which drove the R.34 from Edinburgh to New York were equipped with B.T.H. magnetos built by the British Thomson Houston Co., Ltd., of Rugby. These magnetos, which were described fully in THE AEROPLANE some time ago, are all-British in design and construction and have secured an enviable record during the war for reliability and efficiency.

COMMERCIAL AERONAUTICS & CIVIL AERIAL TRANSPORT

EMPIRE PREFERENCE.

By "MEDWAY."

It may seem rather early to raise the subject of Imperial Preference as applied to aircraft, seeing that at present the Empire Overseas does not boast of an established Aircraft Industry, and at first sight the principle of preferential tariff within the Empire appears perfectly simple and eminently desirable.

We must, however, look forward to the time when there will be a large and world-wide demand for aeroplanes, both for commercial and private use, and consider how the adoption of Imperial Preference might affect the distribution of business among the manufacturing countries.

Much depends on the basis upon which Imperial Preference is established. Hitherto there has been a one-sided system, the Overseas Dominions giving preference on a somewhat modest scale to the Mother Country and to the other Dominions, while Great Britain has not reciprocated. In general the British preference was given by the Dominions in respect of any article 25 per cent. of the value of which was represented by British labour and material. Obviously this definition had the effect of classifying as British a lot of stuff merely assembled on British soil from components manufactured abroad. I believe, for instance, that Ford cars assembled at Manchester have been freely imported into South Africa on preferential terms as British products.

The pre-war scheme was really in the main a mutual arrangement between the Overseas Dominions, each of which realised that assembly was a step towards manufacture, and therefore wished to encourage it. Thus, for example, Canada, without necessarily possessing any genuine manufacturing concerns in the motor industry, could encourage American manufacturers to put up big assembling shops on Canadian soil, on the grounds that the products of these shops would be given preferential terms on export to Australia and elsewhere.

Needed by Aircraft Manufacturers.

This brings us very near to the point which needs special consideration. British aircraft manufacturers ought certainly to have some advantage in their home markets. Import duties are required on a scale calculated to restrict very much the activities of the foreign aircraft manufacturer in his capacity as an importer to Great Britain. We might find that a low reciprocal tariff would serve our purpose quite well in most cases, but that a very substantial tariff would be necessary to keep out the products of certain foreign countries.

Let us suppose that we put on a general duty of 30 per cent. with a preferential tariff amounting to the remittance of half this duty in respect of stuff imported from one part of the Empire to another. The business of the foreign manufacturer is to find a hole in our system so that he can evade the spirit but not the letter of it. Taking the figures suggested above, the American manufacturer importing into the British Empire would pay 30 per cent. The Canadian manufacturer importing into other parts of the Empire would pay only 15 per cent. The American would ask himself whether it would be worth his while to qualify as a Canadian.

Obviously much depends on the definition of "British goods" adopted in connection with our system. If we are to accept the old definition which classifies as British a lot of stuff which is three parts foreign, all the American has to do is to stick up an erecting factory half a mile over the border of Canada and deliver thence to all other parts of the Empire. The Canadian Government might well welcome it because it is better for a country to be an assembler than to have no industries at all. We in Great Britain have, however, got beyond that stage. Our object is to be a manufacturing and not merely an assembling country.

Little or No Advantage.

Our scheme should therefore be such that the assembler within the Empire gets little or no advantage over the foreigner when he wants to import into the British Isles. For certain temporary purposes the Board of Trade refuses to regard as British any manufactured goods of which less than 75 per cent. of the value is represented by British labour and material. We should not go far wrong if we adopted this limit in respect of the Aircraft Industry. We cannot make it 100 per cent. because anybody might find it necessary to import a certain amount of material unobtainable in his own country. At the same time 75 per cent. certainly involves manufacture as distinct from assembly. There is one more awkward point which ought really to be covered. To my mind no concern ought to have the full benefit of the system of Imperial Preference unless the greater part of its profits fall into the hands of British citizens. When a purely foreign concern sticks up a factory on British soil, the profits, if there are any, must necessarily go abroad. Therefore the industry is not as beneficial as it should be to the British community. The point is a very difficult one, because the point of view of Labour would be that it does not matter twopence where the profits go so long as British labour is employed on terms satisfactory to itself. Consequently one could not expect any support from labour interests for a proposal to withhold preferential terms from firms financed from abroad.

Unthinkable.

The President of the Board of Trade had to reply recently to a suggestion that, for preference purposes, it should be necessary that at least 50 per cent. of the value of goods should be represented by labour within the Empire. His answer was that a single percentage which would cover all classes of goods was unthinkable. It was necessary, in his opinion, to have a percentage applying to each particular class of goods affected, and such percentages would only be arrived at fairly after elaborate study.

This is really my excuse for raising the subject. We want the percentage applicable to aircraft to be something like 75 or 80 per cent., and it is clear that, if we are to get this, we shall have to prepare a statement to show that any lower percentage would not be fair or adequate in our case. The subject is an important one to the British manufacturing industry, and this must serve as my apology for boring my reader with a somewhat dry dissertation.

AVIATION IN SCOTLAND: FUTURE PROSPECTS.

By A SCOTTISH CORRESPONDENT.

Though playing an important part as regards aviation during the past five years, Scotland has been somewhat slow to make any progress in the way of commercial or passenger flying. Firms from the South are, however, beginning to find their way to districts in Scotland, and with the addition of the older established companies which have been carrying out war contracts, business promises to be brisk in aviation circles in this country.

The firms which are seriously contemplating future travel are mainly concerning themselves with attempting to obtain the supreme control of any service which may be run from the South to places like Edinburgh, Glasgow, Dundee, Perth and Aberdeen, and several have even now prepared their plans for the efficient carrying of passengers and mails. As a matter of fact, a service would already have been in fairly good order but for the uncertainty which exists regarding the restrictions which the Air Ministry may impose.

Still, firms like Beardmore and Company, of Glasgow, and the British Caudron Company, at Alloa (on the upper reaches of the Forth Estuary), are making extensive preparations for the future, and one can rest assured that Scotland will not be very far behind England when commercial aviation is assured of success, and has come to stay. The Glasgow firm are, however, building airships, and seem more intent to carry out post-war duties with the lighter-than-air types of aircraft than other firms, and it is probable that only passenger carrying will be done by that firm's representatives.

At Alloa the British Caudron Company, an offspring of the famous French company are merely awaiting word as to the relaxing of the present restrictions before commencing work as the first commercial firm in Scotland. At the Alloa ground there are at present three two-seater Caudron biplanes with 100-h.p. Anzani engines. These are doing the necessary pleasure flying, but there are six machines of the same type on the stocks and rapidly nearing completion.

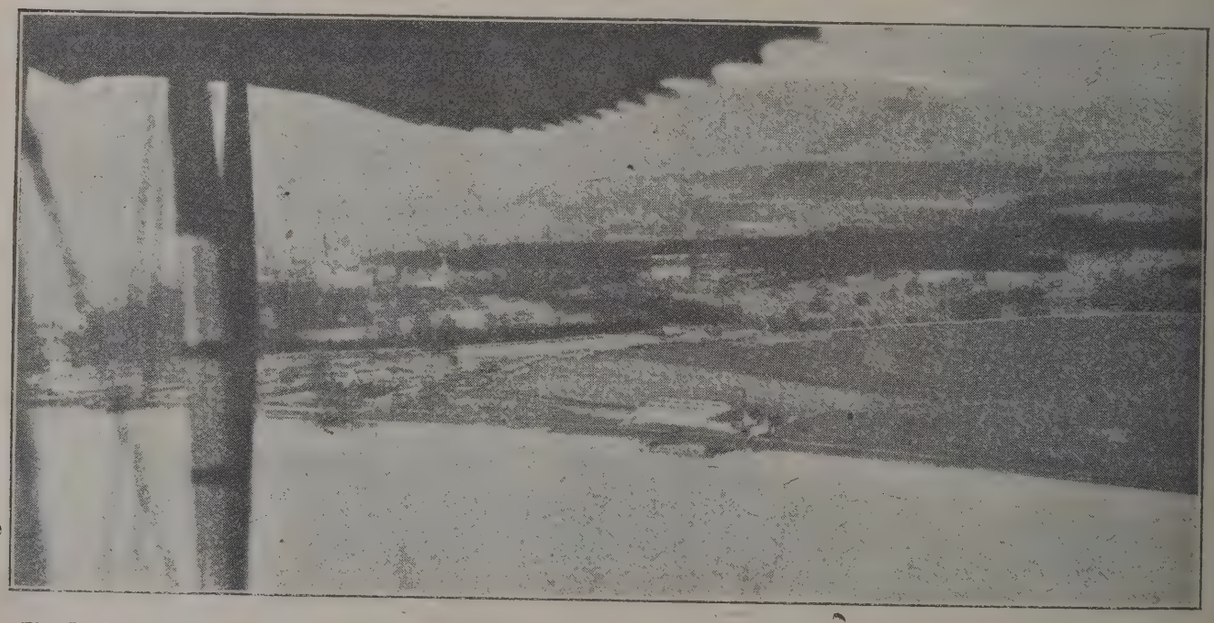
In the event of any sudden demand for commercial work the firm propose constructing a large twin-engined Caudron biplane, which will either carry heavy goods or fifteen or more passengers. The aerodrome is only slightly over an hour's run from Edinburgh, Glasgow, or Perth, so that it is conveniently placed for the conveyance of goods to any of these large cities. In conversation, the manager informed the writer that the company would probably, if business promised to be heavy, enter into negotiations for the taking over of one of the military aerodromes near the city of Edinburgh, such as Penston (in East Lothian) or Turnhouse (three or four miles from the Scottish capital).

Persons who are interested in commercial aviation in Edinburgh predict an extremely busy time for the city, and in all likelihood the capital would become the centre for the country. An indication of how important Edinburgh promises to become was given at a recent meeting of one of the sub-committee meetings of the Town Council in Edinburgh. Numerous applications were received by the Corporation, applying for rights for flying, both commercial and pleasure, in the city and district. As the Council was not sure of its position, the whole matter was held over until answer was received from the Air Ministry regarding several important questions.

The principal application came from Aircraft and Travel (Ltd.), intimating that the company had been registered with the object of promoting commercial aerial transport. Another communication discussed was from Lieuts. Henshall and Caney as to leasing ground at Portobello (Edinburgh's seaside suburb) for the purpose of giving residents and visitors pleasure flights. It is more than probable that both these requests will be granted, and there is every hope once large firms note how important a part Scotland will have in aviation fresh companies will be formed : ground taken over.

There are a number of suitable grounds in Scotland. Glasgow possesses four or five, Edinburgh six, and the country round Perth and Aberdeen, if machines went as far, is well adapted for successful flying.

There is still some hesitancy on the part of the Scottish people to come forward for pleasure flying, but, as a manager of an aviation firm (who understood the cautious Scot) suggested to the writer, this will probably vanish when a good system of insurance is in working order. The flying which is taking place just now is fairly brisk, and one waits for the time when aeroplanes will be patronised by almost everybody. This day is sure to come, and in the meantime the Scottish firms are working quietly and making steady preparations for post-war aviation.



THE NEW HOME OF MR. GLENN CURTISS.

The many friends of Mr. Glenn H. Curtiss throughout the British Empire will be glad to know that he is now established as the Curtiss Engineering Corporation at Garden City, Long Island, New York State, where he has set up well-equipped shops for the building of experimental aircraft, and laboratories for aeronautical research.

His works are actually about 20 miles from New York, in convenient proximity to the U.S. Naval Flying Station, on the South Shore of Long Island, and the Sportsman's Flying Waters in Long Island Sound, on the North Shore of the Island; also, he is not far from Hempstead Plains in the centre of Long Island, so that he is exceptionally well placed for all-round flying, both of land and water machines.

The new Curtiss buildings are of the most permanent type, and are designed specially for aeroplane development work rather than for pure production, Mr. Curtiss's idea being to produce better and better aeroplanes rather than to settle down to run a kind of aeronautical factory. Two wind-tunnels embodying the latest ideas have been installed at the new Curtiss works, and the whole place is equipped to make it a first-class research and experimental establishment.

It is eminently satisfactory to see one of the great pioneers of aviation thus continuing to do really valuable pioneer work instead of degenerating into a mere manager of a quantity production plant. The success of Mr. Curtiss's experimental plant is demonstrated by the performance of the Curtiss-built N.C. boats which crossed the Atlantic, and the further products of his works will be watched with very great interest.

The British Caudron Company's Factory and Aerodrome at Alloa. This photograph was taken by M. R. L. Desoutter from a Caudron C.3 Biplane (100 h.p. Anzani engine).

A PERFECT finish is assured if you are using NAYLOR'S AERO Varnishes, Paints, and Enamels to all specifications for Woodwork, Metal Parts, Wings, etc., etc.

AT THE TALIEDO AEROSHOW.

The third Milan Aeroshow at the Taliedo Flying Ground is deeply interesting, though chiefly so as a review of Italian war efforts.

The mounting of cabins on C.A. bombing aeroplanes and the evident utility of the Svas for carrying a passenger owing to their slow landing speed and rapid pull-up are perhaps the most promising signs of post-war enterprise, if one excepts the regular Milan-Venice dirigible trips, which are most attractive, being about three times as quick and only about four times as expensive as the same journey by railway. Lunch is included in the 300 lire fare.

The Show is housed in several lofty hangars of quite recent construction, and some smaller edifices of a less lasting nature.

A dirigible, a Prassone observation balloon, and some ordinary gasbags are there for the transport and amusement of visitors.

INTERESTING EVEN WITHOUT THE SHOW.

The Caproni, Saml, O.M. and other companies' works, which occupy two sides of the flying ground, and the military aviation sheds and barracks which line the remainder of the boundaries of the field, make the place highly interesting, even without the Show. So that the L.A.N. was wise in choosing the site in preference to a more accessible one. The exhibition with bi-weekly attractions in the way of competitions and stunting shows, is likely, I learn, to remain open for the greater part of the summer.

No fewer than eighty flying machines are staged, exclusive of lighter than air vessels. These eighty may be divided into sections of historic and modern war and peace craft, and a section that contains enemy machines. The curious element is furnished by the Bergonzi "canneton," or young "canard," called the Ardea, a biplane with Anzani 45 h.p. engine elevators in front, and daring vertical and horizontal dihedrals to the planes. Worthy of mention, too, are the Gabardini tethered monoplane and his chief pilot's foot-controlled runabout (steered by the feet only), which are used to get pupils accustomed to the feel of things before going up and wasting an instructor's time.

ALL METAL OR HALF METAL CONSTRUCTION.

The era of all-metal or even of half-metal construction seems as far off as ever, to judge by the naked skeletons of wings and tails so generously exposed on most of the stands. Barring an all-metal tail plane for a C.A., which I did not see in the Show but at the works, nothing of the sort seems to have come into common use.

Of the very large number of Italian motors exhibited probably the Itala is least known to English readers, and certainly the Perfetti-Dolara is the least known to Italians! It is a very perplexing looking and seemingly well-made 300 9-cyl. air-cooled rotary with cylinders parallel to and revolving round the crankshaft, which is to say parallel to and revolving round the longitudinal axis of the aeroplane, and in a line with the direction of flight of the machine. The cylinder heads face the blast of the displaced air much as a revolving cowl of a tractor screw seems to do, and the big ends of the piston rods appear to transmit rotary motion to a flywheel at right angles to the motor axis, that is in the normal position of a flywheel in respect of the airscrew. I hope to send the inventors' detailed description shortly.

The Ansaldo and Macchi exhibits are admirably staged. The former machines are a kind of *leit-motif* constantly appearing all through the Show in varying forms and guises. One who went out to see, however, missed the Marchetti-Vickers biplane and also the Tebaldi-Zari, both out to speed up aerial progress, and the latter of which is much spoken of. After peace has settled whether it is armed or disarmed perhaps Ing. Macchi will not find it expedient to keep M.12 up his sleeve. It has a 450 Ansaldo engine 12 cyl. V, at 60 degrees, which gives 570 h.p. Numerically the Caproni and Ansaldo exhibits preponderate, which signifies these firms' importance in Italian aviation.

The sister to the Fiat Company's B.R. with a huge 700 h.p. 12-cylinder Fiat, destined to cross to America was on view and in the air. With 24 exhaust pipes, the engine when in tune is quite as horrifying as a roundabout organ. The tendency to ever increasing horse-power does not promise well for commercial aviation in this period of depleted treasuries and exorbitant demands. One doubts that even the most important problems of the useful conquest of the air have been fully realised, much less faced.—T. S. H.

A RETURN TO INDUSTRY.

The name of Major H. Waymouth Prance, M.I.A.E., A.F.R.Ae.S., A.I.E.E., will be familiar to the majority of pre-war readers as a partner in the well-known firm of Markham and Prance, Consulting Engineers (motor, marine, and aeronautical), of Dudley House, Southampton Street, Strand, and High Street, Southampton. Like many other businesses of this nature, this firm shut down upon the outbreak of war, the partners and staff betaking themselves to the business of assisting in defeating the Hun and his allies.

Major Prance's duties carried him to the Near East, where he took part in the Gallipoli campaign as second in command of the 2/3rd Battalion London Regiment (Royal Fusiliers). Subsequently, after a somewhat protracted retirement to hospital, Major Prance, being no longer fit for active service, returned to his old sphere—that of petrol engines and aeroplanes—and for the past three years he has been serving in the technical department of the R.F.C. and R.A.F.

Here his duties were of a varied nature. In the early days he supervised tests and prepared reports upon the experimental engines which were submitted to the department. He next took charge of the Technical Information Section, which was subsequently developed into the Technical Publication Section. This section was responsible for the compilation of engine, aeroplane, and seaplane handbooks, data charts and diagrams, for the supply of technical information to the Allies and Colonial Governments, the supply of technical information to engine and aeroplane contractors, and the preparation of reports on German engines and aeroplanes.

His activities in this direction having ceased, it is pleasing to welcome Major Prance back to civil life. His future plans are as yet unsettled, but with his very thorough knowledge of internal combustion engines and up-to-date aeronautical practice his services should be of great use in civil aviation.

Major Prance is one of the "old hands" in aeronautical circles, for his experience dates back many years before the war, and this early knowledge, combined with his war-time experience of aeronautics, should prove a very useful combination.

THE AEROPLANE will be very pleased to put any firm in touch with Major Prance should they wish to correspond with him.

The Cabin of a small Commercial Passenger Italian Airship which is at present educating the public at Taliedo.

FOR USERS OF STEEL.

Mr. E. St. Clair Duncan, of 217, Piccadilly, London, W.1, has sent a copy of the new catalogue just issued by Messrs. Dunford and Elliott (Sheffield), Ltd. This catalogue is well produced, in an interesting and attractive form. It contains complete and instructive details concerning their steels, and also a mass of general information which cannot fail to be of interest to all users of steel.

OLEO PLUGS.

Messrs. Leo Repault and Co., of 64A, Poland Street, W.1, have issued a temporary retail list of their famous "Oleo" plugs, which, in addition to illustrations and prices of various types of plug, contains a number of useful hints as to the selection and use thereof.

THE ENCOURAGEMENT OF ENTERPRISE.

The London and Provincial Aviation Co., of Stag Lane Aerodrome, Edgware, announce that theey are retiring from business This firm is fairly well known to most of those who take any real interest in aviation.

Mr. Warren, its founder, has been intimately connected with the development of British aviation for between nine and ten years, the firm has been building aeroplanes for the last 5½ years, and have trained 550 pilots for the Air Services since the outbreak of war, with only one fatal accident.

The firm has recently produced a two-seater machine, fitted with a 50-Gnôme engine. This machine is of a type eminently suitable for teaching and intended for that purpose, and for sober pleasure flying. By way of securing to themselves an income which would justify their keeping together the staff of trained mechanics which they now employ, the L. and P. Co. had proposed to take three of these machines, a staff of mechanics and a supply of spare engines to the North of Ireland during that holiday season which embraces July 12th, and to visit in turn a number of towns, which, up to the present, have had few opportunities of seeing aeroplanes in flight. Thus they hoped to turn an honest penny or two by giving passenger flights and charging for admission to the ground.

The Department of Civil Aviation have, however, effectively prevented any such enterprise. Their method of so doing has been simple.

Firstly, they refuse to grant a certificate of airworthiness to the machines—because, forsooth, they are fitted with 50 Gnôme engines; and, secondly, they cannot pass as aerodromes any of the fields proposed by the firm for this purpose until complete maps have been submitted and a representative of the Department has inspected and approved the particular fields in detail—a process not likely to take less than three weeks—by which time the opportunity afforded by the present season will be well past.

This example of official methods being merely normal, the company has been forced to the conclusion that in the present state of the law and of the Department of Civil Aeronautics they have no chance of obtaining any return for a continuance of their present expenditure, and they have decided to retire from business till such time as these two hindrances have been reformed.

With particular regard to the immediate cause of this decision, most people who are acquainted with the history of the L. and P. Co. would feel much safer on a 50 h.p. Gnôme-engined machine, designed under Mr. Warren's supervision, flown by one of the L. and P. pilots and cared for by the L. and P. staff of mechanics, than on any of heretofore products of the Technical Department, particularly if this latter were attended by a certified official-hand-book-crammed Ground Engineer—even if it were engined by a salvaged Rolls-Royce.

In the matter of passing flying grounds, the Department of Civil Aeronautics has now had some months in which to get into working order, and it has been officially laid down that one of its most important functions is that of arranging for adequate landing grounds for civil aviation.

That it has not yet an organisation such that there is no spot in the British Isles more than ten miles from the headquarters of an accredited inspector who could report definitely within 24 hours as to whether a given field in his district was or was not suitable for any given aeronautical purpose, simply shows that this particular department has the characteristics of all known British Government departments—and that organisation means to it nothing beyond the provision of adequate methods of shirking its proper duties.

In such matters as this one would feel inclined to back the commercial sense of an experienced firm to select landing grounds which were suitable for their purpose, and would neither wreck their machines nor their reputation.

CIVIL AERIAL TRANSPORT NOTES.

UNITED KINGDOM.

It is notified by the Air Ministry for information that the following addition has been made to the telegraphic address of the Civil Aviation Department, Air Ministry, India House, Kingsway, "Civiatory, Estrand."

BRIGHTON.

Four Avro machines, two 5-seater and two 3-seater, flew from Hounslow to the Ladies' Mile Aerodrome, near Patcham, Brighton, on July 11th, where passenger-flying was started on Saturday, July 12th, with Captain Kennard in charge. Flying will commence every day at 11 a.m. Intending passengers may book their seats at the Avro Joy-Ride Office, at the Aquarium, or at the aerodrome.

On Sunday over 100 passengers were taken up there, and at least 1,500 spectators came to the Aerodrome during the course of the day.

On Sunday morning Colonel Henderson flew the Avro Limousine from Hounslow to Brighton in 30 minutes with two passengers and returned to Hounslow in the evening with two other passengers. Later in the evening two machines that had been flying all day at Brighton returned to town with passengers Commencing next week-end a permanent week-end service will be run from London to Brighton, leaving Friday and Saturday and returning on Monday, the charge being £5 per head single and £7 10s. per head return.

CARDIFF.

Mr. Daniel Radcliffe, the Cardiff millionaire shipowner, flew from Cardiff to London in 1¼ hour for the shipowners' meeting on July 11th.

EASTBOURNE.

Six members of the travelling company of the "House of Peril" were transported on July 12th by a seaplane, making two trips from Eastbourne pier to Brighton pier, where they are performing this week.

GOSPORT

An F.5 Flying-boat was successfully put through its trials on June 30th by Lieut. D. V. Carnegie, A.F.C., R.A.F. There were seven passengers. This is the fourth machine delivered by the Gosport Aircraft Company during the last seven weeks.

COVENTRY.

On Thursday, July 10th, Sir Harry Brittain and Mr. H. Gordon Selfridge flew from Hendon to Coventry to address a Victory Loan meeting. They arrived at Coventry at 2.30 p.m., and before landing circled the town several times, dropping Victory Loan pamphlets, and a letter worth a £5 bond to anyone presenting it at the Victory Loan office.

LONDON.

HENDON.—The afternoon of Saturday, July 12th, was quite as exciting as usual, perhaps more so, as the Summer Meeting was postponed, and only two passenger-carrying carroty "Avros" disturbed the peaceful sight of the trains going by. It had rained quite unpleasantly in the morning, but cleared up quite nicely in the afternoon. It would have been possible to hold the meeting, as rain does not interfere with determined aviators, but the public would not have been very pleased to sit on the wet forms. It strikes one that perhaps after all these meetings are not held entirely for the amusement of the Grahame-White Aviation Co. Despite the fact that there were only about a dozen visitors, it was necessary to wait nearly half-an-hour to obtain tea.

A twenty-mile speed contest for the Victory Trophy (presented by Messrs. Percy Edwards and Co.), will be held at the London Aerodrome, Hendon, on Saturday afternoon next, at 4 p.m.

The course, of which five laps must be flown, is round the Aerodrome Pylons and a point about two miles out, i.e., Bittacy Hill—a distance of approximately four miles.

Some of the pilots who may take part in the contest are Mr. Duke, a new pilot at Hendon, on a 170-h.p. B.A.T. Bantam, Mr. Sykes on a 70-h.p. C.A. machine, Mr. Chamberlayne on an 80-h.p. Grahame-White "Bantam" Biplane, and Messrs. Carr, Robertson and Hicks on 110-h.p. Avro Biplanes.

Entries close at 12 noon on Thursday next, the 17th inst.

Special flying displays and Passenger Flights will be carried out at intervals during the afternoon, and also on Sunday afternoon.

It has now been decided to hold air race meetings at the London Aerodrome regularly every week-end, an air race being held every Saturday afternoon, and special displays every Sunday afternoon. Passenger Flights will take place daily throughout the week.

Additional enclosure accommodation has been provided, and admission to the Aerodrome is now from 9d., plus tax. Children half price.

HOUNSLOW.

On Tuesday the 8th inst. Colonel Henderson flew the Avro Limousine from Hounslow to Aintree and returned the same day. On Wednesday a machine went to Weston-super-Mare with passengers, and another left later in the day with passengers and returned the following day to South Moulton, where over 120 people were taken up for "joy-rides" at the South Moulton Agricultural Association Fair.

The "Evening Standard" has been delivered every day to Southsea by Avro biplane from Hounslow.

During Peace week Avro three-seaters are available for flying to Paris, the charges being £75 return for one or two passengers, and £60 single.

In connection with the flight to Aintree, Liverpool, it is interesting to note that if civilian concerns were carried on in the same way as Government concerns there would be little accomplished.

Colonel Henderson landed at a Midland Aerodrome for petrol and was asked by a ferry pilot what the weather was like in London, as the weather report from the Air Ministry was "Unfit for cross-country flying." Colonel Henderson reported that as he had just flown from London this could hardly be so. He returned from Liverpool the same evening and was again informed by the same ferry pilot that the weather report was still "unfit for cross-country flying." Colonel Henderson then completed the flight to Hounslow in one hour and a quarter, a distance of over 100 miles, and the weather could certainly not have been described as "Unfit for cross-country flying."

The necessity for the one journey was a pressing commercial engagement, and the necessity for the other was merely delivery of Government machines to Civilian Parks.

If ferry pilots were paid for each journey instead of by day, whether they fly or not, there might be a little better effort in these Government Departments.

CRICKLEWOOD.

A successful flight was made on July 11th by a standard two-engined Handley Page, built for the Chinese Government, with whom the company has a large contract. Besides the pilot, Captain G. J. R. Hill, M.C., and the engineer, there were sixteen passengers. The total weight of the machine in the air was 12,800 lbs. A height of 15,000 ft. was reached, and during the tests the pilot flew for a time with one engine.

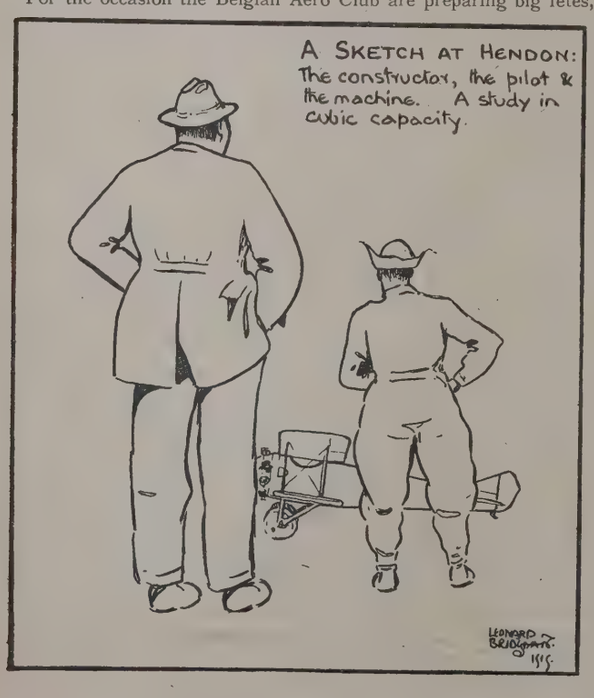
SOUTHSEA.

Amongst the passengers taken up in an Avro at Southsea Common last week was Commander Grieve accompanied by his mother and sister.

Two passengers were taken to Northampton, and two to Bristol and back, the latter journeys taking 1¼ and ¾ hours.

Cardboard discs were dropped over Portsmouth during the week, entitling the finders of the lucky numbers to free Joy Loan Certificates.

AUSTRALIA.



Boulton and Paul, Limited, of Norwich, have constructed an aeroplane for Lieut. A. L. Long, Aus. F.C., which is to be used on a sheep ranch in Australia. The machine was built in six weeks, is fitted with a 90 h.p. R.A.F. engine, and has good speed, climb and lifting capacity. The seating accommodation is adjustable.

As some of the sheep ranches cover 500 square miles, supervision from the air seems to be the ideal way of looking after the various flocks. With a little experience a good estimate of the number of head in the various flocks could be made from the air, and then flocks of the size required for the market could be selected very easily and quickly.

BELGIUM.

It is announced that the Congress of the Federation Aeronautique Internationale will be held at Brussels on October 22nd, 23rd, and 24th.

For the occasion the Belgian Aero Club are preparing big fêtes, at which it is hoped King Albert will assist, and during which they hope to play "Icarus," the opera of M. Deutsch de la Meurthe!

ROUNDING A PYLON.—Mr. Turner on the Bat-Bantam (170 h.p. A.B.C. Engine).

From July 19th to the 24th the Belgian Aero Club will hold an exhibition of Belgian aeronautical material, including Boche spoils of war. It is to be held in the big hangar at Evère, which is to Brussels as Hendon is to London.

It is now confirmed that fifteen hydravions will be used in transporting merchandise in the Belgian Congo.—F. T. N.

DENMARK.

The Danish Government has purchased a number of Avro and Bristol biplanes, which are now on their way to Copenhagen. Some British pilots are accompanying them to instruct the Danish pilots, who will be employed on the projected services between Denmark and the neighbouring countries. Owing to its peninsular formation, Denmark has been handicapped in fast trade with the rest of Scandinavia, with Britain, and with the rest of Europe, which is reached by the inconvenient route through Hamburg.

FRANCE.

Of course the most exciting thing that has happened in French civilian aviation during the last six years is the gift of £80,000 by M. Henri Deutsch de la Meurthe to the French Aero Club. Probably owing to the various fête days and peace celebrations is due the fact that the gift has passed almost unnoticed by the lay Press. This is not by any means the first amount of its kind given by M. Deutsch de la Meurthe, who permanently fulfils the position of president of the French Avro Club.

THE "GOLIATH" OVER THE "MARCHE DE LA VICTOIRE."

At intervals of every few months it is my pleasure to record new departures in the way of aerial advertising, especially with regard to "first issues" as the philatelist would have it, or "first usage" of a philologist. The following cutting from the Paris "Daily Mail" of Sunday, July 6th, speaks for itself. Mr. Dick

To "Aeroplane" Subscribers.

Since the Armistice, the subscription list of the AEROPLANE has steadily increased: an eminently satisfactory development which we are anxious to encourage.

Of the many books published on the war on the Western front, none conveys a more realistic impression of the work of a particular arm than FLYING COLOURS by Captain H. M. S. Saundby, A.F.C., R.A.F., M.C., published at **£2 2s.** net (Edition de luxe) and **15/-** net (Popular Edition).

Among the art books published in the last year or two, none can claim to be a more faithful reproduction of the artist's colour scheme and that indefinable thing, atmosphere.

FLYING COLOURS is a permanent memorial of the life of "the pilot in action," as Major-General C. B. Ashmore calls him. It was very costly to produce, and necessarily the price to the public had to be high.

Many would like to possess it who do not feel disposed to put down Two Guineas for the larger edition or Fifteen Shillings for the smaller.

How to meet their views? We make a special offer to any subscriber for one year to the AEROPLANE: namely to give him the right to purchase either edition at half price.

All he need do is to send us the accompanying order form with cheque for one year's subscription, plus **£1 1s.** or **7s. 6d.** according to the Edition he wishes to have.

In order to be fair to current yearly subscribers we extend the half-price concession to them also. If a subscriber has paid a quarterly or half-yearly subscription, then to secure the right to participate he should send the balance for the year.

Subscribers who have given their orders through the trade, and not direct to the AEROPLANE Office, must sign the form below or a copy thereof, and hand it with the balance on account of the book to their retailer for transmission to the AEROPLANE.

If the subscriber already has a copy of FLYING COLOURS, and would wish to take advantage of this offer, then he may secure McCudden's "Five Years in the R.F.C." **(7s. 6d.)**; Richthofen's "Red Air Fighter" **(3s. 6d.)**, and Gill's "The Aerial Arm" **(6s. 6d.)** at half price, *i.e.* **8s. 9d.** the three, plus the year's subscription to the AEROPLANE.

ORDER FORM.

To THE "AEROPLANE,"
61, Carey Street, W.C.2.

Please send me the "AEROPLANE" for one year post free **(30/- inland ; 35/- abroad)** and one copy of the { Edition de luxe / Popular Edition } of FLYING COLOURS at half price { **£1 1s. 0d.** / **7s. 6d.** } for which I enclose remittance value **£ s. d.**

Subscriber's Name.....

Farman's service of publicity has since intensified its efforts and sent a machine over Paris dropping gold and azure blue leaflets advertising such flights.

THE "GOLIATH" AT THE VICTORY FETES.

THE FARMAN firm takes a sensational initiative. They have decided to place the "Goliath" at the disposal of all those who would like to enjoy the unique spectacle of the Victory Fêtes and the march of the victorious troops passing beneath the Arc de Triomphe. The giant avion will, in conformity with the police regulations, fly at a great altitude but the sight witnessed from it will lose nothing of its grandeur.

The Price for this Extraordinary and Magnificent Aerial Trip is fixed at 1,000 frs. per person.

In the evening aerial trips will be organised to fly over the Versailles and Saint-Germain Château, where the most important episodes of the greatest events which the human race has ever known took place.

The PRICE of these trips from the Toussus-le-Noble aerodrome to Saint-Germain, Versailles, Paris and back on the Victory Fête Day is 500 frs. per person. Apply for tickets and additional information to the

AMERICAN EXPRESS, 11, Rue Scribe, PARIS.

Telephone: Gut. 36.04.

Every passenger if desired will be conveyed in an automobile from his residence to the Toussus-le-Noble aerodrome and back to Paris.

As only a very limited number of passengers can be accepted, persons desirous of taking advantage of this unique opportunity should apply for tickets at once.

It is possible to get eighteen passengers comfortably installed in a "Goliath" apart from pilot and mechanic, and as there are three "Goliaths" now off the stocks a very simple calculation will show that this enterprising firm stand to make nearly £2,000 if the smaller flights are included. Although all the "Victory," seats are not taken, quite a number are booked.

ANOTHER AERIAL EXPLOITATION COMPANY.

Although work in the majority of aviation factories is at a standstill, there is still plenty of war material to use, which accounts for the continued development in the way of new exploiting companies.

The latest which is about to be registered with a capital of £15,000, is entitled Société des Transports Aéronautiques du Sud-Ouest. They have at present one "Goliath," two F.40 aeroplanes and one F.40 seaplane. Having acquired an aerodrome and hangars at La Négresse, near Biarritz, they propose to work from here, running excursions to Bilbao, St. Sebastian, Santander, etc., in Spain, during the summer months—July to November—but to transfer their activities to Nice for the winter season, say, from December to April. They have some very good old-time (1911) pilots, and the moving spirit of the concern, Lieut. Gendner, was taken prisoner by the Boche the same time as Lieut. Villiers, the push-and-go member of La Société des Grands Express Aériens.

FRENCH EXHIBITORS AT AMSTERDAM EXHIBITION.

So far as is known, only Messrs. Bréguet and Farman intend to exhibit at this exhibition, but all is not yet certain owing to the opposition or dilatoriness of the French Government authorities, and another point that may operate against these firms exhibiting is the fact that there are no hangars in the vicinity of the Show, and owing to transport difficulties it is essential that machines be sent by air. Meantime Lieut. Roget hopes to fly to Amsterdam next week, stopping at Brussels and Utrecht on the way.

After many trials and tribulations Lieut. Romanet and his journalist passenger reached Madrid, whilst a good flight was put up in the reverse direction by Lieut. Coupet, who made the flight on a small dual control Farman, 80 h.p. Rhône.

Some people say that to change is to progress: to all such one commends the following announcement which gives the titular heads of various departments in the direction of civil aviation under the new co-ordination scheme recently adopted.

M. Fontan, engineer-director of Technical Services of the Naval Aeronautics, is named Director of Aeronautical Technical Services; Lieut.-Col. Séguin is appointed Director of Service of Aeronautical Construction; Lieut.-Col. Sacconnay, hitherto chief of Aeronautical Civil Service, is appointed Chief of the Service of Aeronautical Navigation.

Lieut.-Col. P. Leclerc, one-time Director of Civil Aeronautics, and now commanding the 1st Aviation Group at Dijon, has lost his wife.

Sergt.-Pilot Camille Frélat, Brig.-Aviator R. Warichet, and Lieut. Frederic Cochet Forthuny all met their death in aviation accidents this past week—the latter at Constantinople.—F. T. N.

GERMANY.

According to the "Weser Zeitung" of July 2nd, Dr. Armo Relizi, of Danzig, and Dr. Walter Geister, intend to start on an Arctic expedition by aeroplanes. The purpose of the expedition is to make topographical, oceanographical and meteorological surveys, and to test the value of aircraft in the Far North. The expedition will start from a vessel going as far north as possible, which will serve as the base for the operations which will be conducted north of the 58th degree of latitude.

The machines will be biplanes of two types, light scouts of great speed and heavy machines for the expedition proper. They will be fitted with floats with flat bottoms to enable them to land on water and/or ice.

ANOTHER AERIAL SERVICE.

The Prussian Minister of Commerce has sanctioned the foundation of an aerial transport company which will be established in Frankfort and have a capital of 15 million marks. Six routes are being planned for freight and letter traffic, all starting from Cologne to Frankfurt, Munich, Stuttgart, Basle, Hamburg and Breslau. It is proposed to open the service with about 200 machines. Eventually, a service for passengers will also be established.

A HEIGHT RECORD.

According to the "Vossische Zeitung" of June 29th, Oberleut. Diemer has beaten his own records by making a height of 9,620 m. in 89 minutes, on June 17th. Three sealed barographs showed 9,620, 9,760, and 9,480 m. height. The machine was one of the military standardised biplanes of the German Aviation Works, better known as the D.F.W., of Leipzig, with a 200-h.p. engine of the Bayerische Motoren-Werke of Munich.

ITALY.

As the result of the investigations of a Governmental Commission as to what is wrong with Civilian Aerial Transport, it is now decided to put the responsibility on that infant's up-bringing on one person's head. Briefly, an Under Secretary of the Ministry of Roads Transports, etc., is to be nominated to care for flying in this land. Mention of a grant of 80,000,000 lire has been made, with what truth one has no means of deciding. Certainly, the want of money has been the first cause of much of the infant's feebleness and failure to develop.

A really Italian magneto is about to shower sparks into our Teutonised magnetic field. Reference to the Monopoli patent shows how the inventor has advanced from standard practice by increasing the number of the polar extremities and gets fat sparks at the slowest speed.—T. S. H.

According to a Turin message of June 27th, Lieut. Brack-Papa, the Italian aviator, with two passengers, flew 159 miles in one hour. Thus, it is claimed, breaking the speed record set up by M. Sadie-Lecointe.

HOLLAND.

It seems likely that the first Aircraft Exhibition at Amsterdam, which is due to open on August 1st, 1919, will be of very considerable interest. Quite a number of British aircraft firms of the best class have taken space at the Exhibition, and though the Society of British Aircraft Constructors, as a Society, is not giving official support to the Exhibition, one gathers that, on the other hand, the Society is not in any way hostile to it.

The following firms have definitely booked space: The Aircraft Manufacturing Co., Ltd.; the British Aerial Transport Co., Ltd.; Vickers, Ltd.; Handley Page, Ltd.; the Gosport Aircraft Co.; the Blackburn Aeroplane and Motor Co.; Marconi's Wireless Telegraph Co., Ltd.; the Wireless Press, Ltd.; Boulton and Paul, Ltd.; the Westland Aircraft Co., Ltd.; R. S. Watling and Son; the Improved Liquid Glues, Ltd.; the Farringdon Propeller and Engineering Co., Ltd.; Geo. Williams and Co., Ltd.

Besides exhibiting machines at the Exhibition it is understood that all the aeroplane firms will also send machines and expert pilots to give exhibition flights. Though the Dutch Government is not officially concerned with the exhibition it is giving every possible support to it, and with the concurrence of the Government a very fine aerodrome has been laid out within easy reach of the most central portion of Amsterdam. Arrangements are also being made for the demonstration of flying-boats and aeroplanes in the immediate vicinity of the Exhibition.

It should be remembered that although Holland itself is a small country, and, therefore, the British Industry cannot expect to receive large orders for aeroplanes to be used in Holland, Dutch traders have enormous influence practically all over the world, and the Dutch East Indies alone offer a fine field for the use of aircraft both of the sea-going and the land-going species. Also, Holland being so easy of access to Scandinavian countries, the Exhibition offers opportunities of getting in touch with possible Scandinavian buyers.

Several French firms are also exhibiting, and, therefore, it is to be hoped that British manufacturers will be able to put up a good show both on the ground and in the air in competition with our esteemed Allies.

Inquiries concerning the Exhibition should be addressed to Mr. J. van der Steen, Trafalgar Buildings, Trafalgar Square, W.C.2. (Telephone: Regent 2648).

Tenders are requested for any or all of the above lots or singly in the case of engines. Forms and all particulars may be obtained from

The Controller, Aircraft Disposal Department, York House, Kingsway, W.C.2.

Closing date for Tenders—July 28th, 1919.

HOW TO ENCOURAGE
CIVIL AVIATION!

The London & Provincial Aviation Co.

REGRET to announce that after between nine and ten years' experience of Practical Aviation on the part of their Principal, after building aeroplanes for 5½ years without a breakage in the air, and after training 550 pilots for the Flying Services with only one fatal accident, they are compelled to cease business owing to the operations of the Department of Civil Aviation.

The said operations make it impossible for the L. & P. Co. to obtain any adequate return for capital, labour, enterprise, experience or industry. The shareholders therefore consider that it is better to play for nothing than to work for nothing.

A number of highly-skilled mechanics will be thrown on an overcrowded labour market.

A number of aeroplanes and engines of proved quality will remain idle.

A number of people will be deprived of the opportunity of flying.

A number of opportunities of increasing public interest in flying will be lost.

A good aerodrome will be left idle.

For further particulars apply—

THE LONDON & PROVINCIAL AVIATION CO.,
STAG LANE AERODROME,
EDGWARE, MIDDLESEX.

AIRCRAFT FINANCE

WHITEHEAD AIRCRAFT SHAREHOLDERS.

What happened and what was said at the meeting of Whitehead Aircraft (Ltd.) shareholders last Friday was interesting and illuminating. The object of the meeting was to pass a resolution for the voluntary winding up of the company. This was carried, but not without some opposition.

LORD WEMYSS' ATTITUDE.

Lord Wemyss, who presided, said that some of the shareholders present might be surprised to see him still occupying the position of Chairman of the company. (It may be necessary to mention that his Lordship had told shareholders at the General Meeting that he would not have any more connection with the company: His association has been brief.) In explanation he would say that he found it difficult to resist the strong appeals that were made to him, apparently with the unanimous support of the previous meeting, that he should continue to occupy the chair, and, further, he did not like, having been captain of the ship, to leave it when it was in troubled waters. When he previously addressed them he told them that they had remunerative contracts in sight, but he also told them perfectly frankly that the undertaking of those contracts depended absolutely on their securing fresh capital.

Unfortunately, the times were not then propitious for the raising of that necessary capital, and the creditors were pressing, and it was therefore necessary to have some alternative scheme. It seemed to him, in the circumstances, that the best chance for the shareholders was to have some amalgamation with an existing company or to sell the property to another corporation or an individual. If their assets had been less valuable than he believed they would prove to be, their task would have been easier, because there would have been fewer people who would want to negotiate for the purchase of those assets.

He thought, however, they had been fortunate in beginning negotiations with a gentleman who was a very successful business man and whose financial position was absolutely undoubted. He referred to Mr. Taylor.

He had been told that various accusations had been made to the effect that all money subscribed had not gone into the coffers of the company. He had ascertained that that was not the fact. It was not correct to say so. What gave rise to the rumour was this. Mr. Whitehead applied for a great number of shares on which he paid 1s. and on which he received the ordinary underwriting commission in order to provide further monies for the company. Mr. Whitehead sold a great number of these shares, and on receiving the money took up the shares he had applied for and paid the money to the company.

THE PROSPECTIVE PURCHASER.

Mr. A. Taylor then addressed the meeting, and said that he was connected with a firm of engineers who had helped to win the war by the construction of aeroplane engines, and they had evolved a light car for which they had a sale of upwards of 15,000. They had to make those cars somewhere, and in looking round for a factory they had come across the premises of the Whitehead Aircraft Company.

If the shareholders would work with the Board, with the liquidators and the Receiver, and if they would keep discord out of the proceedings and avoid the expenses of litigation, his people would meet them at the right and proper time and make a fair proposal for the property, giving them everything that the merits of the situation warranted after the debts had been paid.

Mr. Leaney asked why all the money at call had not been called up. He saw by the balance-sheet that £131,000 of the issued capital had not been called up.

The Chairman said Mr. Whitehead had these shares allotted to him as explained, but he had not the money himself to pay them up.

Mr. Whitehead rose to explain his position. He said that on June 30th last, when the Treasury sanction expired on the issue there were 85,000 Preference shares left which would not have the Treasury sanction on the following day. Owing to an arrangement with the then existing shareholders he was not able to place these shares until £300,000 of Ordinary shares had been allotted and paid for. Therefore, he could not take up those Preference shares in full at that date. As a matter of fact temporarily he made himself the "goat" to the extent of £5,000 He had not been able to place the shares. "Not one of you," he said, "was so hard hit as I am."

Mr. Evans stated that the proposal made by Mr. Taylor could not be considered by the shareholders. They were practically asked to allow him to make all the investigations he chose, and then the shareholders would be asked to consent to any proposal that he desired to make.

Mr. Hammond strongly advised the shareholders to adopt a compulsory winding-up of the company in order that the position might be investigated.

CURRENT TOPICS.

A SPECULATION FEVER.

As soon as the National Loan is out of the way there will be an avalanche of fresh borrowings of all sorts and descriptions, with a good sprinkling of highly speculative things. Doubtless they will be swallowed voraciously by the public. It is beyond question that the speculative germ is rather virulent just now. Those who have profited by the war want to make more money, and those who have suffered because of the war seek compensation. It is wise to inoculate oneself against this fever.

TUBES: AN AMALGAMATION.

There has just been formed a company called "Tube Investments, Ltd.," with a capital of £1,250,000. The objective is to amalgamate by a purchase of shares certain undertakings known to the Aircraft Industry. Thus Accles and Pollock, Ltd., are mentioned, as well as Tubes, Limited, Oredenda Conduits Co., Ltd., and the Simplex Conduits, Ltd. Figuring in the directorate is Arthur Chamberlain, Edgbaston; J. H. Ashton, Birmingham; T. Pollock, a director of Accles and Pollock; and C. T. Barlow and J. Baker, also on the board of Accles and Pollock.

BEARDMORES AND FOREIGN TRADE.

Instead of establishing a new department for the purpose of specialising and developing their export business, William Beardmore and Co. have come to an arrangement with the City firm of John Buck and Co., who have branches throughout the world. To complete the scheme Beardmores have acquired some of the capital of John Buck and Co. and will have the benefit of its experience and organisation.

PROPAGANDA.

Two daily newspapers have blossomed out this week with Aviation Supplements. This is a good sign.

WHITEHEAD AIRCRAFT IN THE COURTS.

In the Companies Winding-up Court on Tuesday last New Pegamoid, Ltd., and another petitioned before Mr. Justice P. O. Lawrence for the compulsory winding up of Whitehead Aircraft (1917), Ltd.

Mr. Owen Thompson, K.C., who appeared for the petitioners, said the company wished for an adjournment. He (counsel) said he understood there was some suggestion of a voluntary liquidation, which would enable all the creditors to be paid in full. This was a company with £1,000,000 capital, and it was not the desire of the petitioners to ruin the company.

PAYMENT IN FULL?

Mr. Cecil Turner, for the company, said a meeting of creditors had been held, at which 70 appeared, and a special resolution was passed unanimously to the effect that it would be in the interests of all that there should be a voluntary liquidation. It was hoped that all would be paid in full, and that there would be a surplus.

Mr. Owen Thompson said he would not oppose a fortnight's adjournment if there was a prospect of the company's suggestion being realised.

Mr. H. E. Wright, appearing for creditors for £5,500, supporting the petition, said he thought a week was the outside time that should be allowed. He understood that a meeting of shareholders had been called for next Friday, and that the meeting of creditors to pass the special resolution would be at the beginning of next week.

Mr. Cecil Turner said the first meeting of creditors with a view to passing the special resolutions would be held next Friday.

Counsel appearing for £3,000 ordinary and a large number of preference shares supported the adjournment for a week.

The Palmer Tyre Co., creditors for £1,482, appeared by counsel, who also represented creditors for £29,000, who at a meeting expressed the opinion that a voluntary winding up would be better for all parties, supported a fortnight's adjournment.

Mr. Turner said a fortnight would enable them to crystallise the matter.

His Lordship said he thought a week's adjournment would be more advisable at the present, and made an order to that effect.

AIRCRAFT IN PARLIAMENT

The following oral answer was given on June 20th :—

AEROPLANES (CYPRESS WOOD).

Mr. REMER asked the Under Secretary of State for Air whether, in view of the fact that the use of cypress on aeroplanes cost the nation over a quarter of a million sterling, he will appoint a small Committee of Inquiry to go into the whole circumstances

Major-Gen. SEELY : The matter has already been fully investigated. The decision to use cypress was taken by the Department on expert advice as a war measure to meet a pressing emergency. I see no reason for a special Committee of Inquiry.

Mr. REMER asked the Under Secretary of State for the Air whether his attention has been called to a minute in his Department proving that one of his present advisers on timber was the official responsible for sanctioning the use of cypress; and what action he intends to take.

Major-Gen. SEELY : I do not know to what document my hon. friend refers in the first part of the question. But, in any case, I do not think any further action is required.

TIMBER TRANSPORT.

Mr. REMER asked the Under Secretary of State for Air whether large quantities of timber were dispatched by rail from Glasgow to London for no other purposes but to be stored; and whether, in view of the fact that traders are complaining of congestion on the railway he will take steps to see that no waste of transport facilities is incurred.

Major-Gen SEELY : I am unable to trace the incident referred to; but if my hon. friend will supply fuller particulars I will have further inquiries made.

FLYING-BOATS.

Lieut.-Comdr. KENWORTHY asked the Under Secretary of State for Air what was the cost for construction of the R34 type of airship; what was the cost of its shed; what is the personnel required at the shed for handling the airship, etc.; what is the estimated total monthly cost of the airship when in commission, including pay of personnel; and what is the cost of the N_3B type of flying boat seaplane, 1919, pattern.

Major-Gen. SEELY : The first part of the question is for the Board of Admiralty, and perhaps the hon. and gallant Member will address the question to them. The cost of the latest flying-boat built to N_3B specification is £9,000 complete with engines; the specification is, however, not a new one.

Lieut.-Comdr. KENWORTHY : What is the cost of the shed ?

Major-Gen. SEELY : Questions as to the shed of the airship should be addressed to the Admiralty. They ordered the ships, although the Air Ministry had control of them for experimental purposes. The actual details of the contract price should be asked of the Admiralty.

Lieut.-Comdr. KENWORTHY : What is the personnel ? Has the right hon. gentleman information as to the number of persons necessary to handle this airship ?

Major-Gen. SEELY : I have suggested that on that point also the question should be addressed to the Admiralty. I included that in the first part of the answer. I think they will be able to give the information required.

Capt. BENN : Are we to understand from that answer that the Air Ministry has not complete control over the lighter-than-air material ?

Major-Gen. SEELY : Yes, that is so. At present we have not complete control of lighter-than-air ships. With regard to personnel, we are responsible for that. The matter is complicated, but it will be adjusted in a very short time

* * *

The following written answer was given on June 26th :—

ROYAL AIR FORCE.—DOGS (IMPORTATION).

Colonel WESTON asked the Under Secretary of State for the Air Ministry, in view of the official report that at one aerodrome 64 dogs had been illegally imported, how dogs on aerodromes would be protected from infection.

Major-Gen. SEELY : The irregular importation of dogs is strictly forbidden, and should be impossible.

Colonel WESTON asked the Parliamentary Secretary to the Board of Agriculture whether he has received any proof of a case of landing dogs illegally from an aeroplane.

Mr. PRATT : The Board of Agriculture have received no official report of the illegal landing of any dog.

* * *

The following oral answer was given on June 30th :—

AIRCRAFT PRODUCTION DEPARTMENT (OFFICERS' LETTERS).

Mr. KELLAWAY (Parliamentary Secretary to the Ministry of Munitions), replying to Sir Francis Lowe, said : Unless marked "Personal" or "Private," letters addressed to individual members of the staff of the Ministry of Munitions are opened in the registry I understand that there is no similar rule in the Admiralty or War Office. The practice was adopted to prevent delay or miscarriage of correspondence. If correspondence is addressed to members of the Ministry and not marked "Private" or "Personal," it is presumably on official business and is opened.

* * *

The following written answer was given on June 30th :—

APRON DEFENCE, LONDON.

Lieut.-Col. PEEL asked the Under Secretary of State to the Air Ministry whether any action has been taken regarding a scheme for the so-called apron defence of London sent to General Headquarters, Home Forces, by Mr. Samuel Jones, of Debenham, on Jan. 31st, 1918; and whether this was the first occasion on which such a scheme was put forward ?

Mr. CHURCHILL : The apron defence of London was installed in 1917. The proposals received from Mr. Samuel Jones, of Debenham, were duly considered, but were found impracticable.

* * *

The following written answers were given on July 1st :—

ROYAL AIR FORCE.—SCAPA SEAPLANE STATION.

Captain BROWN asked the Under Secretary of State to the Air Ministry whether it is necessary to maintain the Scapa seaplane station, where four men are retained without anything to do.

Major-Gen. SEELY : Scapa seaplane base is being retained temporarily until Smoogroo is ready, and will be given up shortly. The station is in charge of a care and maintenance party who are responsible for equipment and stores.

HOURS (NUMBERING).

Colonel WEDGWOOD asked the Under Secretary of State to the Air Ministry whether the system of numbering the hours continuously up to 24, which was adopted in the Army last year, has also been adopted in the Royal Air Force; and, if so, from what date and under what Regulation.

Major-Gen. SEELY : The system in question was adopted throughout the Royal Air Force from midnight, Oct. 19th/20th, 1918, under Air Ministry Weekly Order No. 1,232, dated Oct. 10th, 1918.

FLYING EXHIBITIONS.

Mr. JOYNSON-HICKS asked the Under Secretary of State to the Air Ministry whether any, and, if so, what arrangements are being made for flying exhibitions by members of the Royal Air Force in connection with Peace or other celebrations.

Major-Gen. SEELY : No special exhibitions by Royal Air Force machines are being arranged for. All available machines are already demonstrating on behalf of the "Victory Loan." I think that this is the most useful way of celebrating Peace at the present time

WEEK-END LEAVE.

Major-Gen. SEELY, replying to a question asked by Mr Campbell if the officer commanding No. 70 Group, R.A.F., has issued an order suspending week-end leave, said : Week-end leave has not been stopped. The pre-war practice of granting week-end leave from Saturday midday to Sunday night has been reintroduced. At the same time it has been found possible to restore the practice prevailing before the war of observing general holidays and the giving of extended leave so far as the exigencies of the service permit

LADY SHORTHAND WRITERS (RIPON).

Mr. RENDALL asked the Under Secretary of State to the Air Ministry if he is aware that two lady shorthand-writers engaged at the R.A.F. Ripon depot in January, after five or six weeks' training in technical work, were discharged, although they volunteered to join the W.R.A.F., and that two other ladies requiring training were engaged; what reasons caused this change; and will he insist on an impartial inquiry into the chief section leader's conduct

Major-Gen. SEELY : I have not yet been able to trace the incident referred to, but further inquiries are being made both by the Air Ministry and the War Office, as the depot at Ripon is administered by that Department.

AIR NAVIGATION REGULATIONS.

Mr. JOYNSON-HICKS asked the Under Secretary of State to the Air Ministry whether any number of hours' solo flying is necessary before civilian pilots are licensed; and whether inquiries are being made regarding all crashes which occur in civilian flying.

Major-Gen. SEELY : (1) Tests required for civilian pilots are specified in the directions issued under Air Navigation Regulations, 1919. All pilots who have been licensed have had a large number of solo flying hours to their credit. (2) All possible inquiries are made. The question is being considered by a Committee dealing with points arising on the subject of the Air Navigation Regulations

* * *

The following oral answers were given on July 2nd :—

R.34 AIRSHIP.

Lieut.-Commander KENWORTHY asked the First Lord of the Admiralty if he will state the cost for construction of the R.34 type of airship, the cost of the housing-shed and extensions, the personnel required at the shed for handling, berthing, cleaning the airship, etc., the estimated total monthly cost of the airship when in commission, including pay of persons employed in ship and shed; how many of these airships are under construction; and whether work is being continued on them.

Dr. MACNAMARA : The cost of constructing an airship of R.34 type is approximately £350,000. The cost of the housing-shed at East Fortune, together with extensions and windscreens, is approximately £166,000. Fourteen officers and 400 men are required at the station for handling, berthing, cleaning airships, etc. The estimated total monthly cost of the airship when in commission depends on the distance flown. Taking as basis 8,000 nautical miles per month at a speed of 40 knots, it amounts to about £2,600 at current rates for cost of petrol, oil, and gas. This figure includes the wages of crew and also one-fourth the total pay of the personnel required for handling, etc., as this latter is adequate for maintaining four airships in commission. No further airships of this class are under construction, but six of improved types have been ordered and are in varying stages of construction. Work upon them is being continued.

An HON. MEMBER : Can the right hon. gentleman say whether he has any news of the ship ?

Dr. MACNAMARA : I am sorry to say I have not.

Lieut.-Commander KENWORTHY : Will Peace make any difference to the programme ?

Dr. MACNAMARA : Speaking off-hand I should say no.

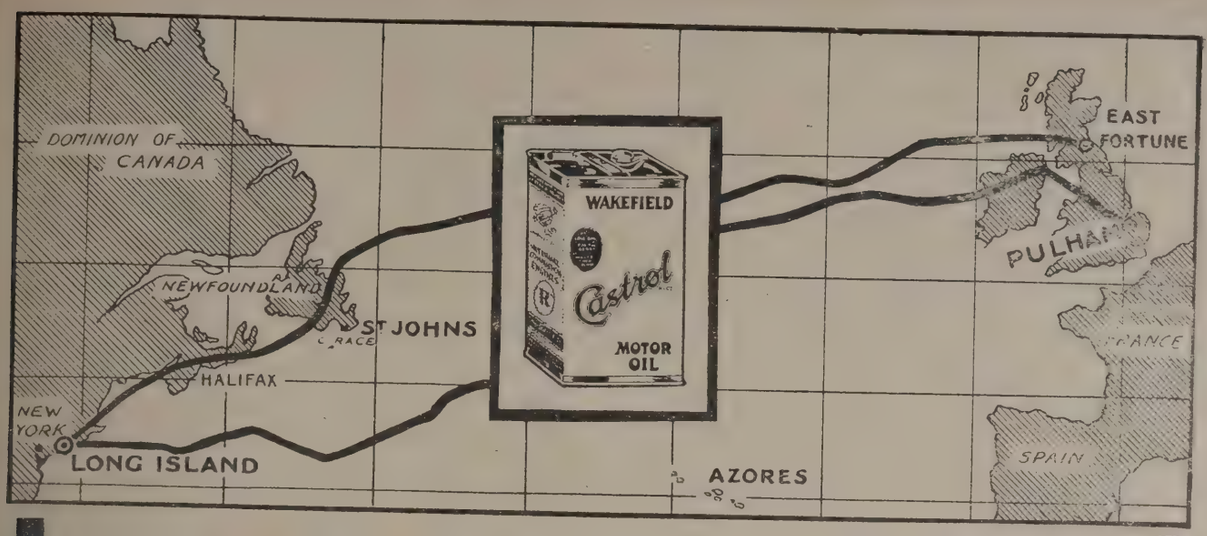
* * *

The following written answers were given on July 2nd :—

CANADIAN AIR FORCE.

Captain W. BENN asked the Under Secretary of State to the Air Ministry whether he is in a position to make any statement about the Canadian Air Force.

Major-Gen. SEELY : I understand the question is under the consideration of the Dominion Government, who will doubtless make their own announcement of policy in due course.



ROYAL AIR FORCE.—AEROPLANES (AUTOMATIC CONTROL).

Captain WEDGWOOD BENN asked the Under Secretary of State to the Air Ministry whether he can amplify the statement recently made by Mr. Baker, the United States of America Secretary for War, on the question of automatic control of aeroplanes.

Major-Gen. SEELY : I regret that I am not in a position to do so at the moment. I will have further investigation made and communicate with my hon. and gallant friend.

MARRIED QUARTERS.

Major-Gen. SEELY, replying to Major Lloyd-Greame, said : I realise that married officers and other ranks of the Royal Air Force are probably finding difficulties in obtaining suitable accommodation near aerodromes. Married quarters will eventually be provided at permanent stations, and in the meantime the possibility of making temporary use of suitable hutting accommodation where available is being investigated.

WOMEN'S CORPS (RAILWAY WARRANTS).

Major-Gen. SEELY, replying to Mr. F. C. Thomson, said that, although concessions were made to the Army and Air Force with regard to leave being a public charge, they were not extended to the women's corps because of the difference in their conditions of service. The question of making similar concessions to the women's corps is now under consideration

* * *

The following oral answers were given on July 3rd :—

FLYING-BOAT CONTRACTS.

Mr. MACQUISTEN asked the Secretary to the Admiralty whether, at the outbreak of war, the Admiralty purchased a flying-boat of new and successful design, by Mr. Norman Thompson, built by Messrs. White and Thompson (subsequently renamed the Norman Thompson Flight Company in 1915), a pioneer firm, established in 1909; whether in 1915 the Admiralty placed an order with the Norman Thompson Flight Company for 10 flying-boats of such size that the firm were compelled to lay out considerable money in additional buildings to their existing works; whether for 12 months after these extensions were completed in May, 1916, the Government were aware that the firm were only able to work at about one-third full output owing to constant changes in design ordered by the Admiralty and shortage of orders, and, if so, whether he will explain why in the autumn of 1916 the Admiralty refused to allow the War Office to place orders with the firm.

Dr. MACNAMARA : With my hon. friend's permission I will circulate the answer in the "Official Report."

The following is the reply referred to :—

In August, 1914, the Admiralty requisitioned a seaplane from Messrs. White and Thompson. The seaplane was an improved form of the "Curtiss" single-engined flying-boat, of which Messrs. White and Thompson were sole concessionaires.

Trials of this machine were successful, and as a result of the trials the machine was purchased and six further machines were ordered. A further order for 10 "America" type seaplanes, to be fitted with engines to be supplied by the Admiralty, was placed with the firm in July, 1915, tender price being finally accepted Dec. 28th, 1915. An advance of 25 per cent. of the contract price was made with the acceptance of tender at firm's request, the firm stating that the greater part of the profits they might derive from the contract would be spent on new factory extensions and land which they were making arrangements to purchase. The firm did not state that such extensions were necessary on account of the size of the flying-boats.

Shortly after the order was placed it was decided to fit 140 horse-power instead of 100 horse-power engines in order to improve the performances of the machines. At this time the firm had in hand 18 S.38 type school aeroplanes; delivery of the last of these was made on June 7th, 1916. In July, 1916, an order for 20 F.B.A. flying-boats was placed with the firm. Various orders for spare parts were also in hand. In August, 1916, the War Office asked the Admiralty whether there was any objection to the firm's resources being utilised for supply of spare parts.

The 10 "America" and 20 F.B.A. flying-boats were then under construction, and it was under consideration to place an order for small flying-boats of the firm's own design, in which circumstances the War Office was informed that the Admiralty's orders would absorb the firm's whole output for some time.

Mr. MACQUISTEN asked the Parliamentary Secretary to the Ministry of Munitions whether a design of flying-boat by the Norman Thompson Flight Company, known as type N.T. 2 B, and officially adopted by the Air Ministry in April, 1918, as a standard naval instruction machine, was ordered in repetition from them and from other firms; whether, in June, 1917, the Air Board required the firm to increase their works for the production of one of their designs of flying-boats, type N.T. 4 A, and subsequently agreed to advance £20,000 for new buildings; whether, after placing considerable orders in the autumn of 1917 for N.T. 4 A flying-boats, the Air Board cancelled those orders in January, 1918, and gave no new orders until May, 1918, after the appointment of a receiver for the debenture holders; whether the Aircraft Finance Department of the Ministry of Munitions in October, 1918, refused the recommendation of the Lubbock Committee of the Treasury to pay off the debentures issued to Messrs. Cox and Company as security for advances and revest the control of the company in the directors; and, if so, whether he proposes to take any action in the matter?

The FINANCIAL SECRETARY TO THE MINISTRY OF MUNITIONS (Mr. James Hope) : The answer to the first three parts of this question is in the affirmative. No such recommendation was ever made by the Lubbock Committee as is suggested in the fourth part of the question, and the fifth part does not accordingly arise.

Mr. MACQUISTEN : Will the hon. gentleman make an investigation into the whole transaction of the Admiralty with this particular company, and allow Mr. Thompson to appear before him?

Mr. HOPE : Not on the information I have at present. If my hon. and learned friend will give me any more information, I shall be delighted to act upon it, but at present his premises, I think, are wrong.

Mr. MACQUISTEN : As the hon. gentleman's information is so meagre, will he take the steps I suggest, so as to get the necessary information?

Mr. HOPE : I take it that it is for my hon. and learned friend to supply me with premises on which I can reasonably act.

ROYAL AIR FORCE.—TECHNICAL OFFICERS.

Sir F. HALL asked the Under Secretary of State to the Air Ministry if he can state what amount of technical pay, if any, it has been decided to award to technical officers in Class A of the Royal Air Force: whether the same is to be retrospective from Sept. 1st, 1918, and will include technical officers demobilised before the decision has been arrived at, and, if so, whether an officer who would thus be entitled to additional pay can claim the same together with gratuity based on the larger amount of pay?

The UNDER SECRETARY OF STATE FOR AIR (Major-Gen. Seely) : The whole question of pay is now under consideration, and I hope to be able to give further information in a short time. Perhaps the hon. and gallant gentleman will put down a question next week.

ATLANTIC FLIGHT (AIRSHIP R.34)

Captain W. BENN asked the Under Secretary of State to the Air Ministry whether he can make a statement about the Atlantic trip of the airship R 34

Major-Gen. SEELY : His Majesty's airship R.34 left East Fortune, near Edinburgh, at 2.48 yesterday morning on an experimental cruise across the Atlantic. She is equipped with every known form of scientific instrument which it was considered would be of value for the trip. We are sure that much valuable information will be obtained as to the possibilities of air traffic across the Atlantic

All being well she will drop messages at Newfoundland and Halifax, and proceed to New York. I should like to acknowledge the great assistance given by the Admiralty in every respect to the Air Ministry, who are responsible for the flight.

His Majesty's ships "Tiger" and "Renown" are in the Atlantic sending and receiving wireless messages. At six o'clock this morning the airship was reported to be about 1,030 miles on her course, and 885 miles from St. John's. The weather reports are very favourable, and it is hoped that she will soon get a following wind.

I may add that what weighed with us most in deciding to attempt this flight was the hope of thereby making still closer the ties between this country and America

* * *

The following written answers were given on July 3rd :—

ROYAL AIR FORCE (BADGES).

Lieut.-Colonel ARCHER-SHEE asked the Secretary of State for War whether officers who have qualified as pilots or observers during the war, and have served in that capacity at the front, are entitled to wear wings on their uniform if since transferred to a line regiment.

Mr. CHURCHILL : Badges of the Royal Air Force may not be worn by Army officers after return to Army duty with their units. A notification to this effect was issued in Army Council Instruction 1,110, of 1918.

CELLULOSE ACETATE.

Lieut.-Colonel THORNE asked (1) the Secretary of State for War the names of the firms referred to on page 5 of the Fifth Report of the Select Committee on National Expenditure who were invited to tender in July, 1915, for supplies of cellulose acetate and what was the reason for refusing to send a tender form to the Cellon Company, of London, and who was the person responsible, and his name, who thus refused permission to an English company and invited tenders from a firm of neutrals adjacent to enemy territory, the Cellonit Gesellschaft Dreyfus, of Basle, who were advertising their wares in the enemy Press; and was the Department aware of this firm's advertisements in the "Chemiker Zeitung" when they invited them to tender; and (2) the Parliamentary Secretary to the Ministry of Munitions the reason why in March, 1918, his Department made an Order forbidding the importation of cellulose acetate as indicated in the Fifth Report of the Select Committee on National Expenditure, in view of the fact that all that which was being produced in this country was pronounced to be defective; will he state the names of the contractors who carried out the erection and extension of the British Cellulose Company's work at Spondon, Derby; and whether this was a contract between the Ministry of Munitions and the builders or the British Cellulose Company and the builders?

Mr. KELLAWAY : I will reply to these questions at the same time. A Committee appointed by the Government is examining this question, and, as was stated by the Leader of the House on July 1st, it is hoped that their report will be ready by the end of the month. In these circumstances I do not think it would be desirable to make any statement at present.

* * *

The following oral answer was given on July 7th :—

NAVY, ARMY AND AIR FORCES (ESTIMATES).

Sir DONALD MACLEAN asked the Lord Privy Seal when he proposes to re-introduce the Estimates for the Navy, Army, and Air Forces in accordance with his promise?

Mr. BONAR LAW : My right hon. friend is mistaken in saying that I gave any promise that new Estimates would be introduced, though I said that the suggestion would be considered. I did say, however, that I thought there ought to be a discussion of the whole subject in the House when we revert to a peace footing, but I do not think that the time has yet come when it would be useful to have that discussion.

* * *

The following written answer was given on July 7th.

IRELAND, MILITARY AND AIR FORCES.

Mr. MACPHERSON, the Chief Secretary for Ireland, replying to Lieut.-Col. Malone, said that it is not proposed to withdraw the Army of Occupation from Ireland.

Mr. CHURCHILL (the Secretary of State for War), replying to Lieut.-Col. Malone said that there were 59,520 Army and 1,789 Air Force officers and other ranks now stationed in Ireland.

* * *

The following oral answer was given on July 8th :—

CANTEEN FUNDS (DISTRIBUTION).

Mr. FORSTER (the Financial Secretary to the War Office), replying to Major Glyn, said that the details of the grants from canteens funds are too lengthy to be given in answer to a question, but he would arrange for them to be published in the Official Report

According to the Official Report, a grant of £2,000 was made by the Central Regimental Fund to the Hospital for Officers, Royal Air Force, in 1917.

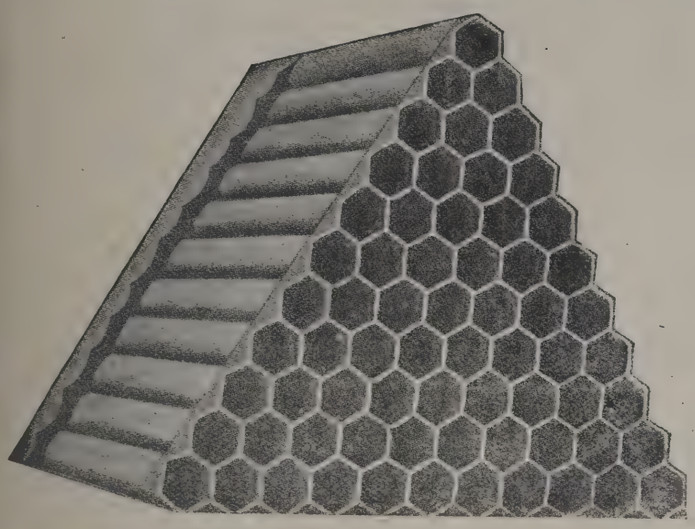
* * *

The following oral answers were given on July 9th :—

RIGID AIRSHIPS.

Lieut.-Commander KENWORTHY asked the First Lord of the Admiralty what will be the total cost of the six rigid airships of an improved type now under construction for the Navy; whether the signature of Peace will enable the building of some or all of these expensive airships to be postponed; and, if not, why is there no difference between the War and Peace airship programme.

Mr. LONG : The estimated total cost of the six rigid airships is £2,200,000. The rigid airship programme was thoroughly revised shortly after the Armistice was signed, and was reduced as far as is consistent with the Peace requirements of the Navy, and with the necessary development of the Airship service. No further reduction is at present contemplated. It should be noted that the six airships are not, as implied in the question, of a single type, but of several types, representing successive stages of development.



Captain WEDGWOOD BENN : Is it proposed to hand over the construction of the lighter-than-air-craft to the Air Ministry; and, if so, when?

Mr. LONG : That does not arise on this question at all.

Lieut.-Commander KENWORTHY : Is it not to be taken into consideration, in the interests of scientific experiment, at any rate, to postpone this building and the expenditure of this money until a later date, and until we have had more experience of this kind of vessel?

Mr. LONG : Those questions have already been taken into consideration by the Board of Admiralty in arriving at their decision.

A PILOT IN THE DOCK. *-(continued.)*

By "THE LINCOLN IMP."

This article was begun as long ago as May 21st, but the Air Regulations have taken up so much of the Imp's time that the sequel has been postponed until now. It is therefore necessary to refresh your memories by "harking back" to the definitions previously laid down.

Culpable Homicide.

Homicide is the killing of one man by another. Unless evidence is given that such killing was justifiable or excusable it is culpable homicide. Culpable homicide done by malice aforethought is murder; if done without malice it is manslaughter. "Malice" has here a technical meaning, and since the Indictments Act, 1915, need not even be alleged in the indictment, but to establish murder it is still necessary to prove that the killing was the result of an act done wilfully and without lawful excuse, the known or obvious consequence of which was the injury of another.

Manslaughter.

Manslaughter is a culpable homicide not done of malice aforethought. Thus a pilot who dived on a crowd for sport or to frighten the people in the erroneous belief that he could avoid all hurt to any of them would be guilty of manslaughter. And, moreover, "if a person whilst doing or attempting to do another act undesignedly kills a man—if the act intended or attempted were a felony, the killing is murder; if unlawful, but not amounting to felony, the killing is manslaughter; if lawful, homicide by misadventure merely." (Archbold, 25th ed., p. 852.)

The Sleaford Case.

In the case recently tried before Shearman, J., at the Lincoln Assizes, the undisputed facts were that two officers being driven in a trap on the high road were killed by an aeroplane piloted by the accused, who was before the Court on a charge of manslaughter.

It was not suggested that the pilot intentionally dived at the trap; much less that the pilot had any intention of doing any injury to anyone, in which case the charge would have been murder; the charge of manslaughter was based on the contention that the pilot was doing an unlawful act in flying low over the high road in breach of the R.A.F. regulations, or, alternatively, that he was culpably negligent in doing the lawful act of flying. By the way, no one seems to have suggested that the *usque ad cœlum* doctrine applied and made him a trespasser on the highway! The jury acquitted the accused.

Importance of the Case.

The Imp has as yet seen no technical report of the case, but from the newspaper account it would seem that there was no evidence tendered of negligent piloting, and the jury rightly acquitted on this head. The breach of R.A.F. regulations would seem to have been admittedly proved, so that the finding of the jury necessarily involves that the R.A.F. regulation against low flying is not part and parcel of the ordinary law of the land.

If it is law, its breach was unlawful but not felonious, and in committing the breach the pilot had *un*designedly killed a man and had therefore committed manslaughter according to Archbold's definition which the Imp has just quoted. There are good grounds for the jury's finding inasmuch as Service Regulations are not always drafted with such skill and care that their wording can safely be allowed to make a criminal out of a pilot who but for that wording would be innocent of crime, though guilty of a breach of Service Regulations.

The Air Regulations.

The Air Regulations, 1919, it will be remembered, are made by order of the Secretary of State under the express authority of Parliament. They are therefore part and parcel of the law of the land. Under the heading "General Safety Provisions" Regulation 5 (2) provides: "No person in any aircraft shall . . . (c) carry out any flying which by reason of low altitude or proximity to persons is dangerous to public safety." Suppose, then, that on the trial for manslaughter of a pilot who had undesignedly killed a man by low flying the jury found that (a) he was not negligent in flying low, but (b) he had contravened Regulation 5 (2) (c).

As matter of law, is this a finding of manslaughter? "Yes," you say, "if it is right that contravention of the regulation is an unlawful act in the doing of which the pilot undesignedly killed the man. This falls within the exact wording of the definition of manslaughter you have quoted." True, but wait a bit. A penalty is laid down for contravention of the Regulations—six months' imprisonment or a £200 fine or both. Surely (it will some day be argued) the draftsman did not intend to incorporate by implication the penalty for manslaughter as well? Surely the statutory penalty is the only one?

See the absurdity of any other construction. A pilot's engine cuts out. He has to fly low over a crowd to land on the far side and without negligence he kills one of them. This is a contravention of Reg. 5 (2) (c), and according to your contention is also an unlawful fact. To any proceedings for contravention it will be a good defence to prove that the contravention was due to the engine cutting out as its unavoidable cause (Reg. 10 (1)). But according to your argument, though defensible, it is still an unlawful act and consequently manslaughter! This is one of the endless questions of interpretation which the Regulations are destined to raise in the future.

THE COMPANIES (CONSOLIDATION) ACTS, 1908—1917.

IN THE MATTER OF

The Norman Thompson Flight Company, Limited.

(In Voluntary Liquidation.)

Pursuant to Section 188 of the Companies (Consolidation) Act, 1908, Notice is hereby given that a meeting of the creditors of the above named Company will be held at the Hall of the Institute of Chartered Accountants, Moorgate Place, Moorgate Street, London, E.C.2, at 2.30 p.m., on Monday, the 28th July, 1919.

Notice is also hereby given that the creditors of the above named Company are required, on or before the 22nd July, 1919, to send in their names and addresses and particulars of their debts and claims to W. R. Clemens of Aldermans' House, Aldermans' Walk, Bishopsgate, London, E.C.2., one of the Liquidators of the Company, and, if so required by notice in writing from the said Liquidator, are, by their solicitors or personally, to come in and prove their debts or claims, at such time and place as shall be specified in such notice, or in default thereof they will be excluded from the benefit of any distribution made before such debts are proved.

Dated this 15th day of July, 1919.

H. J. MORLAND, F.C.A.
W. R. CLEMENS, A.C.A.
Joint Liquidators of the Company.

GREAT BRITAIN.

FROM THE COURT CIRCULAR.

BUCKINGHAM PALACE, July 10th.

The following officer was introduced into the presence of the King, when His Majesty invested him with the Insignia of the Most Honourable Order of the Bath (Companion, Military Division) :—Major-Gen. Tom Webb-Bowen, R.A.F.

His Majesty then conferred decorations as follows :—

THE MILITARY CROSS.—Capt. Charles Banks, R.A.F.; Capt Erroll Mauduit, K.R.R.C., attd. R.A.F.; Capt. Ronald Mauduit, Dragoon Gds., attd. R.A.F.; Lt. Albert Robertson, Aust. F.C.

BUCKINGHAM PALACE, July 12th.

The following were severally introduced into the presence of the King, when His Majesty invested them with the Insignia of the respective Divisions of the Orders into which they have been admitted :—

THE MOST DISTINGUISHED ORDER OF SAINT MICHAEL AND SAINT GEORGE.—Companion.—Lt.-Col. Henry Smyth-Osbourne, R.A.F.

THE DISTINGUISHED SERVICE ORDER.—Maj. Francis Feeney, R.A.F.

THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE.—Officers (Military Division).—Lt.-Col. Reuben Farley, R.A.F.; Lt.-Col. John Rubie, R.A.F.; and Maj. Charles Bell, R.A.F.

Member (Military Division).—Capt. William Bowring, R.A.F.

NAVAL.

ADMIRALTY, July 12th.

The King has been pleased to approve of the award of the following decoration to the following officer :—

DISTINGUISHED SERVICE CROSS.

Paymr. Lt. (now actg. Paymr. Lt.-Comdr.) H. G. Badger, R.N.—For distinguished services as observer in one of the seaplanes employed on spotting duties during the attack on the German cruiser "Königsberg" on July 6th and 11th, 1915.

ADMIRALTY APPOINTMENTS.

The following appointments have been made :—

JULY 11th.—Eng. Comdr.—W. W. Newton, to "Argus," July 10th.

JULY 14th.—Comdr.—C. V. Robinson, to "Empress," in command, July 12th.

R.N.R.—Paymr. Sub-Lt. (temp.).—H. G. Swanwick, to "Empress," June 28th.

* * *

On July 11th two Naval F.5 flying-boats (two 350 h.p. Rolls-Royce engines) left Felixstowe for Dundee, this being the first stage of a nine days' flight to Scandinavia and back. The boats belong to No. 4 Communication Squadron, and each one carries a crew of five, including a wireless operator.

Owing to thick fog one of the boats was forced to land at Orford Bay, Suffolk, on July 11th, but proceeded to Dundee the following day.

The route will be *via* Dundee to Christiansand, Christiania, Copenhagen, Stockholm *via* the Baltic Coast, Goteborg (direct route *via* Lydkoping and Nonkoping), Esbjerg, and so back to Felixstowe, covering a total distance of 2,380 miles.

The meteorological authorities in the three countries concerned have arranged to forward to the stopping points daily reports and forecasts of weather conditions.

* * *

On July 7th H.M.A. R.33 started from Pulham, Norfolk, on a flight of 900 miles. During the flight she passed over Nottingham, Grantham, Peterborough, and Norwich, and returned to Pulham on July 8th, the flight having been accomplished in 31 hours.

H.M.A. R.33 will shortly fly from the Naval Airship Station at Howden, East Yorks, to India. The journey will take from 15 to 20 days, and stops will be made at towns (unnamed) in France and Switzerland, and at Rome and Cairo.

Twenty-two tons of petrol will be carried, the distance being roughly estimated at 6,000 miles. The gunner's seat in the tail of the airship will be used for meteorological work and for observation.

The ship is expected to leave Pulham shortly for Howden.

* * *

The officers and crew of Seaplane 8663 claimed in the Prize Court on July 14th for prize bounty for the destruction of U.C.36. Mr. Wilfred Lewis appeared on behalf of the claimants.

In this case it appeared from the affidavit of Captain Henry George Boswell, D.S.C., R.A.F., that on May 20th, 1917, he was in command, jointly with Captain Charles Reginald Morrish, D.S.C., R.A.F., of H.M. Seaplane 8663, and he sighted an enemy submarine 20 miles E.N.E. of the North Hinder Lightship in the North Sea.

The seaplane attacked the submarine with bombs, two of which struck her, and she sank by the stern. There were no survivors. The submarine had been ascertained to be the U.C.36, manned by 25 hands.

Mr. T. H. T. Case, on behalf of the Procurator-General, said that the claims were not opposed.

The President granted declarations that the following amount of prize bounty was payable to the Seaplane 8663, namely, £125.

* * *

The following communiqué was issued by the War Office on July 7th :—

Tsaritsin-Saratov Front.—Tsaritsin was taken on June 30th by Denikin after fierce fighting; tanks and aeroplanes co-operated.

The following communiqué was issued at Simla on July 8th :—

Aeroplanes from Chaman report a certain amount of movement among Abdul Qudo's troops and tribesmen within the Afghan limits, who are concentrating west of the Bogra Pass, probably on account of the water there.

The following communiqué was issued at Simla on July 9th :—

A letter from the Amir of Afghanistan dated June 29th was received at Simla yesterday, in which he enters into a long dissertation on the one-sided character of the Armistice terms and the impossibility of their literal observance.

He also considers it advisable that we should forgo the free movement of aeroplanes over Afghan territory, which, he states, will inevitably provoke the Afghans to fire upon them, in spite of strict prohibition, which would result in our retaliation, leading to a breach of the Armistice.

* * *

It was reported from Chaman that on July 9th British aeroplanes bombed some tribesmen near the Bogra Pass.

* * *

Apropos the photograph which appeared in THE AEROPLANE recently of a Bristol monoplane crossing the Andes, a correspondent writes saying that the sight of the machine recalls happy memories of Bolo muddling. Apparently, 12 of these Bristol monoplanes were sent to Chile as part payment for a battleship. It is alleged that these particular machines were stored in the Royal Enclosure at Ascot for many months until the Authorities decided that something ought to be done with them. One day instructions arrived that they were to be stripped of all useful accessories prior to "reduction to produce." Consequently, Vickers guns, pressure pumps, instruments and so forth were removed. Six months later still nothing had happened and the fuselages were hidden by cobwebs and dust.

Then one day instructions were issued for six of the machines to be sent to the School of Aerial Gunnery at Marske and the others to Montrose. The various accessories which had been removed were replaced hastily and the machines were dispatched. A few days afterwards they were returned to Ascot, and the only explanation given was that the pilots at this Station at the time did not like monoplanes, though, as a matter of fact, the Bristol had been proved to be an extraordinarily fine fighting machine.

Later, again, the machines were sent for another and equally futile journey, and, finally, it was decided to send them to Chile, after adapting them to take 110 h.p. Le Rhône engines.

It would be interesting to know whether the machines which actually got to Chile were those which showed such curious

homing proclivities. Should they be so, one would be surprised to learn that two of the machines succeeded in crossing the Andes after thus being bandied about in England if one did not know the excellence of the design and workmanship of the Bristol firm. If, in fact, the Chilian machines are actually the Ascot machines we have here another splendid testimonial to the Bristol Company.

* * *

The following highly coloured story was issued recently by the Air Ministry. THE AEROPLANE disclaims all responsibility :—

A remarkable tribute to the stability of the British aeroplane comes from India in the form of a story of an airman's race from Amballa to Simla against heavy dust and thunder storms. Major H. A. Tweedie, Australian Flying Corps, flying a Sopwith "Camel," left Amballa for Simla. Visibility was so poor, that at a height of only 6,000 feet it was impossible to see a spot five miles distant, and more extraordinary still no hills were visible. Flying by compass, Major Tweedie bore north-east into the clouds at 7,500 feet and again climbing failed to get above the clouds.

He then made up his mind that it was practically useless to carry on, but looking around he found nothing could be seen ; a dense fog and ominous indications of a severe duststorm were creeping up behind. Climbing still higher Major Tweedie observed that the storm was getting nearer and nearer. He says he could not make up his mind which would reach Simla first. Hoping against hope that he could race the storm he climbed his machine to 10,000 feet, and was relieved to see the Simla hills in front of him.

In order to approach the aerodrome it was necessary to come down into a cup in the hills. The moment he throttled down, however, the machine became unmanageable owing to the bumps due to the thunderstorm overhead. Eventually, compelled to approach the ground "down wind" owing to the storm, he was lucky enough to make the dangerous approach of about 300 feet deep and only accessible from one end. Jumping a wall between trees fifteen feet higher the pilot made the landing just as the storm broke. So severe was it that within a quarter of an hour there were over twenty holes in the fabric of the planes caused by hailstones larger than pigeons' eggs.

The arrival of the machine at Simla created a great impression, particularly amongst the natives, who saw an aeroplane for the first time.

* * *

Messrs. Robinson and Cleaver have put in a claim to the Royal Commission on Awards to Inventors in respect of suits for aviators. The claim was heard on July 14th, and the Commission reserved their decision.

AIR FORCE.

FROM THE "LONDON GAZETTE."

AIR MINISTRY, July 8th.

R.A.F.—The following temp. appts. are made at the Air Ministry :—Staff Officers, 3rd Class (Air).—Capt. R. G. Parry, D.S.O., July 4th, 1918 (substituted for notification in "Gazette," Oct. 18th, 1918)

Staff Officers, 4th Class (T.).—Lt. S. J. Furse, Sept. 14th, 1918.

The notification in "Gazette," June 20th, concerning Capt. W. A. A. Chauncy is cancelled.

FLYING BRANCH.—Maj. F. W. Lucas, O.B.E., to be actg. Lt.-Col. (A'ship) while specially empld., May 26th.

Capt. W. H. Mackenzie to be actg. Maj. while empld. as Maj. (A. and S.), May 1st.

Sec. Lt. C. W. Sutcliffe to be Sec. Lt. (A.), from (Ad.), April 8th.

P.F.O. G. L. Barrett (late R.N.A.S.) is granted a temp. commn. as Sec. Lt. (K.B.), May 16th, 1918 (substituted for notification in "Gazette," July 9th, 1918).

D. J. Stewart (temp. Sec. Lt., R.E.) is granted a temp. commn. as Sec. Lt. (O.), April 24th, 1918.

Sec. Lt. G. A. Lynch (Sec. Lt., Yorks L.I.) is granted a temp. commn. as Sec. Lt. (O.), Aug. 8th, 1918.

The following relinquish their commns. on ceasing to be empld. :—Sec. Lt. R. Smith, Oct. 9th, 1918, and is granted hon. rank of Sec. Lt. (substituted for notification in "Gazette," Oct. 18th, 1918); Lt. D. Leeson (Capt., Brit. Col. R.), Nov. 19th, 1918; Lt. F. J. Simpson (Lt., Brit. Col. R.), Dec. 18th, 1918 (substituted for notification in "Gazette" June 6th); Sec. Lt. (Hon. Lt.) A. L. G. Price (Somerset L.I.), Jan. 25th; Lt. A. Gibson (Lt., Sask R.), Feb 19th; Sec. Lt. W. R. Hudson (Lt., Manitoba R.), March 10th; Lt. G. E. Leishman (Lt., Cent. Ont. R.), March 31st; Sec. Lt. A. E. White, M.C. (Lt., Can. Rly. Servs.), April 8th; Lt. J. P. Francis (Lt., Can. Hrs.), April 14th; Sec. Lt. (Hon. Lt.) G. W. Drowne (Lt., Manitoba R.), April 22nd; Lt. W. J. Gillespie (Lt., E. Ont. R.), April 30th; Lt. G. E. Lucas (Lt., W. Ont. R.), Lt. D. R. Smith (Lt., Quebec R.), May 4th; Lt. D. R. McLaren, D.S.O., M.C., D.F.C., May 14th; Lt. J. E. Price (Lt., Sask. R.), May 16th; Sec. Lt. (Hon. Lt.) H. Symons (Lt., Herts R., T.F.), May 23rd; Lt.-Col. A. C. Critchley, C.M.G., D.S.O. (Lt.-Col., temp. Brig.-Gen., Lord Strathcona's Horse), May 31st; Lt. H. F. Moore (Lt., Manitoba R.), June 10th; Capt. R. T. Van-Der-Byl (Lt., temp. Capt., Brit. Col. R.), June 23rd; Lt. R. H. Luxton (Lt., Can. F. Art.), June 27th; Lt. A. H. Hinton (Lt., Can. F. Art.), June 28th.

Transfd. to unempld. list :—Sec. Lt. J. MacDonald, Feb. 6th; Capt. J. H. N. Drope, Feb. 11th; Sec. Lt. J. L. Brown, Feb. 15th; Sec. Lt. R. I. Palmer, Feb 19th; Sec. Lt. F. D. Sec. Lt. J. W. Thompson (late Gen. List, R.F.C., on prob.) is confirmed in rank as Sec. Lt., Dec. 10th, 1918.

The following are granted temp. commns. as Sec. Lts.:—F. G. L. Heyes, June 24th; W. Graham, July 4th; E. C. A. Clarke, W. Macpherson, C. S. Roads, July 7th.

The following relinquish their commns on ceasing to be empld.:—Capt. H. B. S. Stephenson (Capt., R. Mun. Fus.), Nov. 25th, 1918; Sec. Lt. (Hon. Lt.) F. H. Sibley (Capt., R.F.A.), June 13th; Lt. J. T. Wright (Lt., R.N.), June 25th.

Transferred to unempld. list:—Lt. (Hon. Capt.) H. P. G. Branston (Sher. For.), Feb. 8th; Sec. Lt. N. H. Midgley, Feb. 12th; Lt. M. J. Penwick, March 14th; Sec. Lt. (actg. Lt.) W. L. Roblou, March 19th (substituted for notification in "Gazette" of July 4th); Lt. D. Miller, Sec. Lt. C. E. Thorpe, March 21st; Sec. Lt. P. J. Holmes, April 16th; Lt. T. B. Duncan, M.C. (Scott. Rif.), April 19th; Lt. J. McK. Hooper, April 25th; Lt. J. T. Denman, April 27th; Lt. L. S. Thompson (R. Dev. Yeo., T.F.), May 6th; Lt. A. S. Hibbs, May 8th; Sec. Lt. B. M. Hickman, May 14th; Lt. E. S. C. Sen, May 23rd; Sec. Lt. R. G. Ashby, May 24th; Sec. Lt. H. G. Arnold, Lt. F. Bagot, May 29th; Lt. J. D. P. Sowbury, June 1st; Lt. F. H. Barratt, Sec. Lt. R. F. Pyke, June 2nd; Sec. Lt. S. V. Daley, June 6th; Lt. J. C. G. Sibley, June 7th; Lt. V. C. Baker, June 9th; Lt. R. W. G. Morrison, June 11th; Lt. L. Taylor, June 12th; Lt. J. H. Clive (Lt., Lond. R., T.F.), Capt. C. W. Small, June 14th; Capt. E. H. T. Atkinson, June 17th; Sec. Lt. E. H. Sherman, M.C., June 18th; Sec. Lt. (Hon. Capt.) G. H. Blake, D.C.M., June 19th; Sec. Lt. V. Brimacombe, June 20th; Sec. Lt. J. Ferguson, June 21st; Lt. C. F. Palmer, June 24th; Sec. Lt. E. N. Allott, Sec. Lt. W. C. Snowdon, Capt. J. W. Culme-Seymour, June 25th; Sec. Lt. W. E. Doran, June 26th; Capt. H. Sherwood, Maj. J. B. Handley-Seymour, June 27th; Sec. Lt. W. Fillery, June 29th; Lt. H. S. Nicholls, July 1st; Lt. W. J. McLean, July 3rd.

Lt. L. G. Hall relinquishes his commn. on account of ill-health contracted on active service, and is granted the rank of Capt., June 12th.

Lt. L. D. Brown relinquishes his commn. on account of ill-health contracted on active service, and is permitted to retain his rank, June 30th.

Sec. Lt. H. T. Wellard relinquishes his commn. on account of ill-health, and is permitted to retain his rank, July 3rd.

The rank of Lt. F. R. T. Pearson is as now described, and not Sec. Lt. as stated in the "Gazette" of March 21st.

The notification in the "Gazette" of June 10th concerning Sec. Lt. R. C. E. Vernede is cancelled.

Technical Branch.—Capt. A. C. Baker to be actg. Maj. whilst empld. as Maj., Grade (A.), from April 1st, 1918, to March 12th.

Lt. H. E. Hazlehurst to be actg. Capt. whilst empld. as Capt., Grade (A.), Sept. 16th, 1918 (substituted for notification in the "Gazette" of Nov. 29th, 1918).

Lt. H. E. Hazlehurst to be actg. Capt. whilst empld. as Capt., Grade (A.), from (A.), from Dec. 11th, 1918, to April 30th.

Sec. Lts. to be graded for purposes of pay and allces. of Capts. whilst empld. as Capts., Grade (A.):—(Hon. Lt.) J. Drew, (Hon. Capt.) R. C. Fowler, T. E. Morton, May 1st.

Sec. Lts. to be graded for purposes of pay and allces. as Lts. whilst empld. as Lts., Grade (A.):—G. J. C. W. Fitzwilliam, L. T. Bulmer, May 1st.

Sec. Lt. J. R. Hovenden to be Lt., without pay and allces, of that rank, Aug. 28th, 1918.

Sec. Lt. C. R. Booth to be Sec. Lt., Grade (A.), from (Ad.), Feb. 22nd.

Sec. Lt. F. S. Read to be Sec. Lt., Grade (B.), from (Ad.), Oct. 1st, 1918.

Sec. Lt. (Hon. Lt.) C. O. Wright (Lt., King's Own R. Lancs. R.) relinquishes his commn. on ceasing to be empld., June 10th.

Transferred to unempld. list:—Maj. (actg. Lt. Col.) A. S. Hellawell, O.B.E., March 27th (substituted for notifications in the "Gazettes" of April 4th and June 27th); Sec. Lt. J. W. Davis, April 1st; Lt. D. N. Stewart, April 2nd; Lt. R. Hopkin, Sec. Lt. W. H. Hildreth, April 17th; Lt. C. E. Devas, April 18th; Lt. L. H. Scott, April 20th; Sec. Lt. C. F. Hodges, April 30th; Sec. Lt. J. E. Kocford, May 2nd; Sec. Lt. H. D.

Dall, May 6th; Capt. H. K. Hitchcock, May 12th; Sec. Lt. H G Smith, May 19th; Sec. Lt. M. Bateson, Sec. Lt. E. G. Doyland, May 21st; Lt. W. D. Hogarth, May 24th; Lt. J. Hooper, May 26th; Sec. Lt. E. A. Sullivan, Sec. Lt. (Hon. Lt.) R. J. Wallace (R. Scots, T.F.), May 28th; Capt. R. Bissett, Sec. Lt. (Hon. Lt.) S. O. Savillec, May 29th; Sec. Lt. H. Hilsdon, Capt D. Cameron-Swan, May 30th; Capt. F. W. Strong, May 31st; Lt. (Hon. Capt.) A. D. S. Barr, Capt. H. E. Shaw, Maj. D. B. Sanders, June 1st, Sec. Lt. R. O. Street, June 3rd; Sec. Lt. J. L. Baring, June 6th; Capt. J. G. Dothie, Sec. Lt. W. A. Hill, June 7th; Sec. Lt. H. Archer, June 8th; Sec. Lt. J. F. Farquharson, June 10th; Sec. Lt. S. W. Bennett, June 11th; Capt. H. S. Slade, June 12th; Lt. T. J Boyer, June 14th; Lt. E. H. Hart, Lt. G. F. Wilson, June 17th; Sec. Lt. F. N. Lynch-White, June 19th; Maj. E. Darrell-Huskinson, Sec. Lt. H. S. Smith, Maj. G. L. Wightman, June 23rd; Sec. Lt. H. H. Fanthorpe, Sec. Lt. A. Marr, June 24th; Sec. Lt B. B. Long, Sec. Lt. H. W. Levy, June 25th; Sec. Lt. G. Albert, June 26th; Lt. H. H. Ballard, June 28th; Sec. Lt. W. Massey, June 30th; Sec. Lt. W. E. Dewberry, Maj. H. W. Prance, Capt. P. Swain, July 1st; Sec. Lt. H. A. P. Disney, Maj. E. R. Peal, O.B.E., D.S.C., July 2nd.

Sec. Lt. (Hon. Lt.) F. J Colishaw relinquishes his commn on account of ill-health contracted on active service, and is permitted to retain the rank of Lt., July 3rd.

The notification in "Gazette" of April 25th concerning Sec. Lt. F. B. Miles is cancelled (notification in "Gazette" of April 15th to stand).

The notification in "Gazette" of June 13th concerning Lt. J. W. McKee is cancelled.

MEDICAL BRANCH.—A. G. Graham is granted a temp commn. as Capt., July 18th, 1918 (substituted for notification in "Gazette" of July 19th).

Transferred to unempld. list:—Capt. M. R. Dobson, April 25th; Capt. T. R. F. Kerby, June 29th; Maj. H. F. Horne, July 2nd.

DENTAL BRANCH.—Capt. J. Barratt is transferred to unempld. list, May 29th.

MEMORANDA.—Sec. Lt. J. Keyes to be Lt., May 22nd.

Lt. (Hon. Capt.) E. H. Grant (Capt., Arg. and Suthd. Highrs.) relinquishes his commn. on ceasing to be empld., July 3rd.

Transferred to unempld. list:—Maj. (actg. Col.) C. A. J. Butter, O.B.E. (Sco. Horse, Yeo., T.F.), Feb. 7th (substituted for notification in "Gazette" of Feb. 21st); Sec. Lt. (actg. Capt.) F. C. Payne, from (S.O.), April 10th; Lt. H. Hibbard, from (S.O.), May 2nd; Lt. V. L. Anderson, from (S.O.), May 28th; Capt. A. H. Stuart, from (S.O.), May 29th; Lt.-Col. J A. Houison-Crauford, C.M.G., C.B.E., from (S.O.), June 1st; Lt.-Col. F. H. Cleaver, C.B.E., D.S.O., from (S.O.), June 26th; Capt. G. C Milnes, M.C., from (S.O.), July 2nd.

Sec. Lt. C. W Kerr to take rank and prec. as if his appt as Sec. Lt. bore date May 1st, 1918.

The name and number of the following Oversea Cadet is as now described and not as in "Gazette" of June 13th:—183195 G. E. Glenn.

The notification in "Gazette" of June 6th concerning 177155 Flt Cadet F. W. Carter is cancelled.

In connection with the Victory March through London on July 19th the Royal Air Force will contribute a contingent of 55 officers and 605 men, and the W.R.A.F. four officers and 120 ranks. Nineteen squadrons from the Army of Occupation will be represented, together with personnel from the four Areas and from the 29th and 11th Groups. These numbers will be exclusive of the G.O.C. and Staff.

Major-General Sir J. M. Salmond, K.C.B., C.M.G., C.V.O., D.S.O., commanding the R.A.F. in the field, will be in command of the contingent, with Brigadier-General G. L. Lambe, C.M.G., D.S.O., as his Chief Staff Officer.

* * *

The Air Ministry announces that the R.A.F. Eastern aerodrome at Yatesbury has been closed. All machines landing at Yatesbury should, therefore, use the Western aerodrome.

The aerodrome at Wyton has also been relinquished by the R.A.F.

* * *

An order has been issued by the Air Ministry with regard to the supply and renewal of artificial limbs for disabled airmen.

The procedure followed is precisely the same as that applying to disabled soldiers, i.e., through the Local War Pensions Committee and the Director of Artificial Limb Supplies—Ministry of Pensions.

Thus, if a discharged disabled airman is in need of further surgical treatment, or if his artificial limb requires repair he should apply direct to his Local War Pensions Committee. In the former case the Committee will arrange for his treatment by the nearest Civil, Military, or Air Force hospital available.

The Committee will also defray all travelling expenses necessarily incurred by a discharged airman in connection with the repair or renewal of his artificial limb, and his attendance at the hospital selected.

* * *

Saturday, July 12th, was the last day of the Royal Naval, Military and Air Force Tournament. It was an unqualified success, and it is greatly to be regretted that it was not possible to continue the Tournament for a longer period.

The prizes were presented by H.R.H. the Duchess of Albany.

The following are among the results of the competitions held at the Royal Naval, Military, and Air Force Tournament:—

JULY 8th.—Tug-of-War (110 st.).—The winners of the Navy, Army, and Air Force competitions were 3rd Bn. Leinster Regt., the challenge cup being presented in the arena by Capt. R. C. Dalglish, Royal Navy.

JULY 9th.—Sabre v. Sabre (Championship).—1, Col. R. B. Campbell, D.S.O., Gordon Highrs.; 2, C.P.O. Cassford, Royal Navy; 3, Capt. Walter Palmer, M.C., K.R.R.C.; 4, tie between Serjt.-Maj. H. Grainger, R.A.F., and Comdr. E. W. H. Brookfield, Royal Navy; 5, Major E. G. S. Cooke, 8th Bn. Essex Regt.

July 11th.—Tug-of-War (130 stone).—3rd Battalion Coldstream Guards (Chelsea) beat No. 5 Stores Depot, R.A.F., Earl's Court, by two pulls to nil.

July 12th.—Bayonet v. Bayonet Championship.—Lieut. F. H. Durham, R.M.A., 1; Serjt.-Major H. Grainger, R.A.F., 2; Serjt. H C. Randall, R.M.A., 3.

* * *

On Aug. 15th and 16th a cricket match between teams representing the R.A.F. and the Army will be played at the Oval.

* * *

At Stratford Police Court recently, Serjt. Eric Potter, R.A.F., was sentenced to one month's imprisonment with hard labour, for stealing a number of cricket pads, a quantity of motor cycle fittings, and other articles. It was stated that the prisoner was in charge of the stores at the Woodford Depot of the R.A.F., and that he had sent five cases of goods to his home in Staffordshire.

* * *

By order of the Home Secretary, Captain Walter Raymond Hinchcliffe, D.F.C., R.A.F., who was sentenced on June 28th to six months' imprisonment in the second division for the theft of a motor-cycle and side-car at Skegness, has been released on account of ill-health.

* * *

At Sussex Assizes on July 10th Lieut. Leslie Joseph Holland, R.A.F., was sentenced to five years' penal servitude for assaulting William Farrow, manager of the Shoreham branch of Farrow's Bank, with intent to rob him.

Prisoner, who was a customer of the bank, entered the premises disguised, and, on the pretence of desiring to open an account, enticed the manager from behind the counter, and then struck him on the head with a sandbag containing sand and two shillings' worth of coppers, and threatened him with a revolver A struggle lasting 10 minutes ensued, causing a crowd to assemble outside the bank. Three man broke into the bank, as the door had become unlatched during the struggle, and secured Holland.

The defence was that war service had rendered the prisoner unaccountable for his actions.

FRANCE.

The following has been received from a Paris correspondent:—

Fate, silent, inexorable Fate, has claimed another of her foremost subjects. In the afternoon of the 10th inst. Lieut. Jean Navarre was killed whilst trying to land at Villacoublay. Further reports on the actual accident will be awaited with interest, as it seems that by dexterous navigating, after an apparent misjudgment of distance, he almost landed safely, but, losing flying speed, he sideslipped on the turn and crashed.

Navarre was one of the first Aces of the war early in 1916, and performed prodigies of valour during the Verdun battles, bringing down nine Boches in three following special missions. At this latter work he vied with Védrines in success.—F. T. N.

U.S.A.

The following appeared in the official Air Service news published in the United States of America:—

"The Army Air Service has been chosen by more than forty high school graduates of Greater New York this year as a technical institution of higher learning, in preference to the technical colleges of the country. Of this number more than one-half are financially able to attend regular institutions of learning, but all elected the Army to gain knowledge that will fit them as aeronautical engineers at the end of a three-year course.

"The others are students who would be obliged to work their way through college and have chosen the Army because their status will be exactly the same as the boys of independent means and completion of the course is assured.

"The incident has opened the eyes of Army officials to the new and high regard of the educational value of the Army and the possibilities of securing men of the highest order for the Air Service. Accordingly an energetic campaign is being prepared to present the opportunities for higher education and technical aeronautical instruction to high school graduates in all parts of the country. A number of aviation officers will be detailed for this work, and educational boards will be requested to include such an officer as a speaker in the graduation programme of public schools.

"It is pointed out that the Army instruction is not confined to theory, but combines a minimum of theory with a maximum of practical work which should develop aviation experts of the highest order. The social and athletic features of college life are not lost in the Army. Regular hours, good food, and plenty of exercise will keep the students in the best physical condition, and programmes of sports are followed by the men with the same degree of enthusiasm as in college.

"A feature which particularly appeals to proud parents is that every letter from 'the boy' does not contain an eloquent story of destitution and the crying need of a check, for in the Army he is being paid while he learns. With the signing of the peace treaty soldiers will be allowed to wear civilian clothes, and with liberal

pass privileges the hours of study are practically the same as in college.

"The New York boys have dubbed the aviation school 'Khaki University.' The Army extends a hearty invitation to any high school graduate who wishes to associate himself with the development of the commercial aviation to acquire a technical education at the expense of the Government."

* * *

The first U.S.A. Government peace-time order for aeroplanes has been placed by the Navy Department with the Loening Aero. Eng. Corp., New York, for the immediate delivery of six special Loening monoplanes for shipboard observation use.

With characteristic American modesty it is claimed that this machine, a new type of two-seater fighter, after official tests was found to be the fastest and best performing two-seater fighter in the world.

They are intended to be launched from the deck of a ship, and each is fitted with a 300-h.p. Hispano-Suiza engine.

PERSONAL NOTICES.

NAVAL.

ENGAGEMENT.

CUCKNEY—WILLIAMS.—The engagement is announced between Captain E. J. Cuckney, D.S.C., R.A.F., and Miss L. Williams, of Wimbledon.

MILITARY.

DEATH.

BODDAM-WHETHAM.—Lieut.-Colonel A. C. Boddam-Whetham, D.S.O., 4th Battn. Argyll and Sutherland Highlanders and R.A.F., of Earlscliffe, Folkestone, who was killed in an aeroplane accident in Egypt on June 22nd, was the eldest son of the late J. W. Boddam-Whetham, late of Kirklington Hall, Notts, and Mrs. Boddam-Whetham, and husband of May Grace Boddam-Whetham. He was 35 years of age.

ENGAGEMENT.

MAUDUIT—BROOKSBANK.—A marriage has been arranged, and will shortly take place, between Captain Mauduit, 7th Dragoon Guards and R.A.F., eldest son of Lieut.-Colonel Mauduit, of 57, Sloane Street, and Mrs. Mauduit, and Irene, daughter of the late Captain A. H. Brooksbank, 19th Hussars, and Mrs. Brooksbank, of Middleton Hall, Yorkshire.

AIR FORCE

DEATHS.

HALL, SUMNER, VANCE and JAFFE.—On July 9th the military postal aeroplane, No. 41,591, crashed near Pourriers (Var). As a result of the accident the petrol tank exploded and the machine caught fire. The four occupants were killed. They were Lieuts. Hall, Sumner, and Vance, and Cpl. Jaffé.

Lieut. Francis Cyril Sumner, R.A.F., was the eldest son of Mrs. Sumner, "Inversnaid," Bromley, Kent, and of the late Frank Sumner, Engineer to the City Corporation. He was 20 years of age.

HERBERT, HILEY, and BIZION.—Two pilots and a mechanic were killed at Farnborough on July 14th as the result of a collison in the air. One of the machines concerned was a two-seater Avro, of which the pilot was Lieut. Herbert, R.A.F., attached to the Royal Aircraft Establishment, and Air Mechanic C. Hiley. The other was an S.E. Fighter piloted by Lieut. Bizion, R.A.F.

KNIGHT.—Lieut. C. R. Wentworth Knight, R.A.F., who was killed in action on June 21st at Topsa, on the Archangel Front, was the only son of Mr. and Mrs. W. H. Knight, of Towns End House, Limington, Ilchester. He was 21 years of age, and had served continuously in France and elsewhere since January, 1915.

MATURIN.—An inquest was held on July 10th on the body of Lieut. William Henry Maturin, R.A.F., an American, aged 28, who shot himself while drowning in Langstone Harbour. It was stated that Mr. Maturin had been invalided out of the R.A.F. and he had been unable to obtain work. A verdict of suicide while temporarily insane was returned.

ENGAGEMENT.

TAYLOR—LOCOCK.—The engagement is announced of Capt. Bernard A. Taylor, R.A.F., only son of Mr. and Mrs. A. E. Taylor, of Crawley, Sussex, and Kitty, third daughter of the late Capt. H. F. Leicester Locock and Mrs. Leicester Locock, of Pook's Hill, of Angmering, Sussex.

MARRIAGES.

BARTON—LEE.—On July 5th, at Woodton Parish Church, Lieut. Charles Frederic Barton, R.A.F., of Toronto, Canada, was married to Mary Letitia Driffield Lee, younger daughter of the Rev. Frederick and Mrs. Lee, of Woodton Rectory, Bungay, by the Rector, the father of the bride.

EVAMY—HANNAFORD.—On July 9th, at St. Matthias Church, Torquay, Capt. H. S. Evamy, R.A.F., was married to Dorothy Jeanette, eldest daughter of Mr. and Mrs. C. J. Hannaford, of Chulmleigh and Torquay, Devon, by the Rev. W. P. Alford.

TOLFREE—NASH.—On June 26th, at Kas-er-Nil Garrison Church, Cairo, Lieut. W. M. N. Tolfree, R.A.F., youngest son of Mr. and Mrs. W. H. Tolfree, of Winsford, Cheshire, was married to Frances Winifred, only daughter of Mr. and Mrs. F. R. Nash, of Guildford, Surrey, by the Rev. E. L. Millen, C.F., assisted by the Rev. H. Valentine, C.F.

BIRTHS.

CUMMINGS.—On July 8th, at Streatham Manor, the wife of Lieut. Philip H. Cummings, D.F.C., R.A.F.—a daughter.

HELLYAR.—On July 12th, 1919, at 27, Bonham Road, Brixton Hill, S.W.2, to Captain (late R.A.F.) and Mrs. William F. Hellyar—a daughter.

HUMFRESS.—On July 5th, at 61, Rusholme Road, Putney Heath, the wife of Capt. H. T. Humfress, R.A.F., of a daughter.

LINDEMAN.—On July 8th, at 12, Walpole Gardnes, Gunnersbury, the wife of Capt. Gerald N. Lindeman, R.A.F.—a son.

MAXTON.—On July 18th, at the Firs, Westgate-on-Sea, Ruby Beatrice (née Holmes), wife of Captain L. G. Maxton, R.A.F.—a son (Geoffrey).

ROBERTSON.—On July 6th, at Rempstone, Cheriton Road, Winchester, the wife of Capt. Norman Robertson, R.A.F., of a son.

SMITH.—On July 10th, at 20, Ladbroke Gardens, to Olive Merle (née Nickson), the wife of Capt. W. E. Smith, late R.A.F.—a son.

STAMMERS.—On July 8th, at the Nursing Home, Gerrards Cross, to Muriel, the wife of Capt. S. R. Stammers, A.F.C., late R.A.F., of a daughter.

STRICKLAND.—On June 30th, at Dublin, the wife (née Bentham) of Harley, Lieut. C. W. Strickland, R.A.F., of a daughter.

SOME THOUGHTS ON REORGANISATION.

One wonders why it is that in England everything appears to come too late. In whatever light one regards the late war one is sure to come upon something that might have happened earlier—that, indeed, should have happened earlier—to be really appreciated. Although, in some cases, it would have been better had it never happened at all. The Armistice was one of these latter things.

Take the signing of the Peace terms, which, it is stated, fell so adventitiously upon the very day (five years later) that the Archduke Franz Ferdinand of Austria was assassinated, that it seems to indicate some very clever arranging upon the part of the politicians.

"Playing to the Gallery" that sort of thing is called, but the Gallery is tired of the Play. It has had so many occasions for celebrating already that it scarcely knows what to do with July 19th. Besides, one cannot well celebrate any Peace properly while enduring a shortage of alcohol. And the thought of a Ministry of Health to look after one and tell one what not to do is enough to spoil anybody's pleasure.

But Peace Celebrations have little to do with reorganisation in the R.A.F., excepting always the fact that the R.A.F. will need a lot of reorganising after the Peace Celebrations. One does not really see why it should, but that seems the right kind of thing to say of the R.A.F.

Of course, reorganisation in the middle of a war is recognised by everybody as being bad. But one wonders if it is really so bad as no organisation at all. Or if it is as bad as forming a new Service on nearing the end of a war, just when Britain is about to start winning her last battle, having—in the good old way—lost most of the foregoing ones.

One has only to think of the R.N.A.S. to remember how badly in need of reorganisation it was. If only the Government could have been original for once and said—with the fashionable folk—"Oh! damn convention"—or some such thing—and reorganised that. One feels sure it would have paid in the long run.

Naturally, the pukka Navy people would have felt a little injured at first, because nobody likes to own one's poor and unconventional relations. But there seems no reason against a pilot becoming serious as he grows older. Personally, one rather doubts if he will.

One calls to mind a certain pilot, who, some few hours after one's first meeting with him, fused all the electric lights in the building so that one sat in darkness for a week.

Still, reorganisation is good even when it comes too late to save what might have been a very useful branch of His Majesty's Senior Service.—S. F. BENDA.

JULY 23, 1919.

THE AEROPLANE

VOL. XVII. No. 4.

The Editorial and Advertising Offices of "The Aeroplane" are at 166, Piccadilly Lond n. W.1.
Telegraphic Address: "Aileron, London." Telephone: Mayfair, 5407.
Accounts, and all correspondence relating thereto, should be sent to the Registered Offices of The Aeroplane and General Publishing Co., Ltd., Union Bank Chambers, 61, Carey Str et, London, W.C.2
Subscription Rates, post free: Home, 3 months, 7s. 6d.; 6 months, 15s.; 12 months, 30s.

U.S.A., 1 Year, $8.50c.

ON PREPARING FOR WAR.

Last week I endeavoured to show that there must be a next war, and prophesied that the great war will be one waged by all the Teuton tribes, such as Franks, Burgundians, Anglo-Saxons, Belgicæ, Jutes, and Germans, against the whole Slav Race. I propose now, purely as a matter of personal opinion and not in an impersonal editorial capacity, to hazard a few prophecies as to the manner of coming of the real World War, and as to the part which the Air Force will play therein.

Recently Major-General Sir Frederick Maurice, a very gallant soldier who threw up a splendid military career because he had the courage of his convictions, made the astonishing statement that, though he had been brought up to believe that preparation for war was the surest guarantee of peace, he now believed that "if you prepared for war you got war." The natural inference is that in his opinion if you do not prepare for war you do not get war.

That may be literally true, for the good and sufficient reason that if you do not prepare for war you get conquest. One still believes firmly that the only way in which the lamb can lie down peacefully with the lion is with the lamb inside. Surely General Maurice would not have us believe that the big strapping athletic man in the pink of condition is more likely to be assaulted in the street than is a little ill-conditioned chap, especially if the big man behaves like a gentleman and the little chap behaves like a cad. Yet that is precisely the difference between a big nation prepared for war and a little nation unprepared.

Let him remember that it was the impudent behaviour of Servia to Austria over the assassination of the Arch-Duke Franz-Ferdinand by a Servian at Sarajevo, as the result of a plot hatched in Servia, which was the small cause from which the long-avoided European tribe-fight began. And it was the bullying and blustering of unprepared Russia which actually began the war.

If Russia had been fully prepared Germany would not have fought when she did. And by the time the war did begin France and Great Britain might have been better prepared for it, and it might have been over quicker. But then again it might not. In any case it is foolish to argue that either man or nation must not train for fighting because if they do they will get into a fight. It seems so obvious that if they do not train they will merely be consistently bullied and assaulted by those who have the sense to go into training.

Therefore, whether we see a war coming or not it is our duty to keep in training—that is to say, to prepare for war. In our particular case the coming war can be seen quite plainly with the naked eye, though it is impossible to judge with any hope of accuracy when it is likely to arrive.

The war must evidently be with the Slav Race, for the Slavs are a very young and undeveloped people compared with the older civilisations of the West, and it is a law of history that the young races develop towards the West and in time replace the older races. Always the replacement is done by peaceful penetration in the end, for though waves of invasion from the East may have temporary success they are always beaten back, and leave only a trace behind.

Let us then consider how this war with the Slavs may arise.

History Repeating Itself.

Up to the present moment the course of the rebellion against the government of His Imperial Majesty the Tsar follows curiously along the lines of the French rebellion of 1789, which ultimately became known as the French Revolution and produced the first French Republic and the first French Empire.

The first outbreak followed closely the lines of the declaration of the States-General in France. The feeble but intense Kerensky resembled the "sea-green incorruptible" Robespierre, except that he lacked Robespierre's strength in dealing with his enemies and Robespierre's courage in dying for his opinions.

The two arch-criminals of the Bolshevik misrule, Lenin and Trotsky, seem to resemble Marat and Danton, or possibly Carnot and Barras, without the solidity of character of the Frenchmen, though it is said by those who ought to know that Lenin is an honest fanatic.

The Bolshevik "Red" Armies, with their People's Commissaries and their Soldiers' Councils, are like those which under the States-General defended the frontiers of France against the Germans, Austrians, and English. The fighting in Northern Russia and near Petersburg may be taken as a parallel to the battles of the period of Fleurus, and the fighting against Koltchak and Denikin is a close parallel to the campaigns of Kléber and Hoche against the loyalist Chouans in La Vendée in 1793 and against the Prince de Condé in the north.

It is to be hoped that Koltchak and Denikin will do better than did La Rochejacquelin, Stofflet, La Ville-Beaugé, and Vaugiraud at that period. They certainly have better backing from their Allies, but, being Russians themselves, their followers may fail in the moment of victory just because of that lack of intensity of purpose and that childish characteristic of losing heart or losing interest at the critical moment which stamps the Slav as the savage which he is, no matter what veneer of culture he may have acquired during a sojourn in a more civilised country, or in a school under the management of a civilised foreigner.

The Departure from the Parallel.

The parallel with the French Revolution fails in the fact that France was one single nation, whereas the Slav situation is complicated by the number of small "self-determined" Republics which have set themselves up, and keep upsetting themselves and everybody else. None can follow with any clearness of idea the squabbles of the Letts, Balts, Esthonians, Ruthenians, Finns, Karelians, Ukrainians, and so forth on the West and North of what used to be the Russian Empire.

Nor is the Polish position any clearer, seeing that the present Polish Government claims bits of Germany and Austria, as well as Gdansk (better known to the civilised world as Danzig), bits of Ruthenia, part of the Ukraine, and some of Hungary. The Polish propagandist people in Paris have recently been kind enough to send me a number of interesting pamphlets, which lead ultimately to the conclusion that at one time or another in its lurid history Poland has conquered most of Central Europe.

These conquests seem to have been made whenever a warlike Polish prince has prepared for war, and they seem to have been lost through unpreparedness for war. Which unpreparedness has always been due to the Slav's constitutional inability to stick to one object and make a job of it. The one perfectly clear fact which emerges from all the pamphlets is that German Poland has always been more prosperous than any other country inhabited by Poles. As, for example, the statement that in 1906-1910 Lithuania and White-Ruthenia (under Russian government) produced 6 quintals of rye per hectare, "Congress" Poland produced 10 quintals, and the German Polish province of Posen produced 15.6 quintals.

Delaying the Big War.

The natural inference is that the Slav, whether pure Russian, Pole, Lett, Ruthenian, or anything else, will only work when he has a master to make him work. So long as all these Slav tribes keep on squabbling among themselves the rest of Europe may exist in comparative peace and safety. Therefore it seems very sound policy to keep them all fighting. It prevents them from coming under the leadership of one great man, and incidentally it keeps the Slav population from increasing too rapidly.

But, and here is the key to the whole situation, if and when the Slav Napoleon arises, then the Slav peoples will be made to settle down to work. They will pile up wealth (for Russia is by nature the wealthiest portion of the world), they will pile up population, and then they will overflow, by the Law of Nature, to the West.

Where Is the Leader?

None can guess where that great Slav leader is to-day. Perhaps he is not yet born. Perhaps he is a boy soldier in a Bolshevik regiment. Perhaps he is an ambitious young officer of the old régime. It is well to remember that Napoleon, who was a mere youth when the French rebellion first began, was trained as a child in the old Royalist military academy; and similarly a young Russian officer whose personal ambition is greater than his loyalty to the Tsar may make himself master of the Slav peoples.

He will have no difficulty in finding supporters in the Bolshevik armies, for here the parallel to France of 1790 to 1800 is very close. The popular belief is that Napoleon's famous Marshals and Generals all rose from the ranks, and were men of the people. So far as one remembers, Lefebvre and Jourdan were the only Marshals who rose from the ranks, though several minor Generals did so. All the other Marshals and most of the Generals (who were as a rule older men than Napoleon himself) were trained at the old Ecole de Guerre, founded by M. le Duc de Choiseul in 1761, which preceded the Saint Cyr of to-day.

Hardly any, if any, of Napoleon's officers were of the Higher Nobility, but many were of the well-to-do Bourgeoisie or of the Minor Noblesse. When the utter chaos of the first years of the Revolution settled down under the Directory and the Consulates, and something like law and order was restored, the decent people who were still left in France felt it to be their duty to help in defending the Country against foreign invaders. Some of them even approved the Revolution in principle, though not as practised by the "Red" revolutionaries. And so they set to work and helped in restoring order and discipline in the Army, realising that even a Republican government was better than no government at all. And when Napoleon rose to power they supported him as a great leader who would do more for France than would any government composed of middle-class nonentities elected by the people. Wherein they were perfectly right.

The Parallel Again.

Something very similar is already happening in Russia to-day. Lenin and Company, who are the equivalent of the Directory, have already gone far towards abolishing Liberty—as understood by the mob. Their rule is "No work, no food." Their system of compulsory education is said to be excellent. I am told that it is modelled on the American system, modified and improved to suit their own purposes and the Russian mentality. They are hammering into the heads of their people the doctrine of obedience. And it is well to remember that, despite the Bolshevik outbreak of savagery, the Russian is by nature inclined to be obedient.

The survivors of the *bourgeoisie* in Russia are supporting these efforts to bring the populace into a proper state of subjection, for it is their only hope of self-preservation. The professional soldiers, having lost everything they ever possessed in the world except their military knowledge, are helping to put the Bolshevik troops into a proper state of discipline, for they know that without discipline they cannot even feed the troops and themselves.

The power of the Commissaries of the People in the Bolshevik armies is decaying—just as it decayed in the French Revolutionary Armies—and the power of the Directory over the troops and people is growing. As the Central Government's power grows, so the possibilities of mob-rule in the Provinces decreases. And so something like an established Government is coming into being. Such a Government will bring the mob properly to heel and Central Russia will become consolidated.

Meantime all the little Slav Republics round her borders will go on fighting with one another, becoming more and more poverty-stricken and depopulated. The result must be that when the great Russian leader arises—a new Peter the Great or Ivan the Terrible—these enfeebled States will fall easy victims to his well-fed and well-equipped armies.

Some day Lenin will be assassinated, or will commit suicide, or perhaps will die a natural death. He will probably be succeeded by weaker or less honestly fanatical or less able men, and then will come the opportunity of the great leader.

Or, as a possible alternative, Admiral Koltchak and General Denikin, either or both, may defeat the Bolsheviks utterly and establish a military government in Central Russia, under a Military Directory, in place of the Bolshevik Directory. In this case also the proletariat will be brought to heel, and a settled government will strengthen Central Russia while the outlying Slav tribes are hammering one another into a state of exhaustion and preparing themselves to be conquered.

The March of Conquest.

In either case the great leader will find his opportunity waiting for him. One by one the petty republics will be brought under his thumb. The Esthonians will seek his protection against the Letts, or *vice versa*, and he will help the one to conquer the other, so that ultimately he will absorb both. Similarly he will help the Servians to conquer the Bulgars, or *vice versa*. And he will help Jugo-Slavs to conquer the Poles or the Czecho-Slovaks, or the Roumanians, or the other way round.

It will not matter in the least to him which tribe he helps to conquer the other, because ultimately he will rake the lot into his great Russian Empire. And when he has done all that he will find himself up against the Teutonic and Latin races of Western Europe.

The Slavs will be flushed with conquest and will think that they can go on conquering Westward as easily as they absorbed all the little Slav republics. They will be met by the Germans in the North, by the Bavarians and Austrians in the Centre, and by the Swiss and Italians in the South.

How far that march of conquest will progress will depend on two or three factors. Firstly on how much strength Germany can raise to stop the Slav advance. Secondly on how much support France will give to Switzerland and Italy. And thirdly on how much help Great Britain will provide by sea, land, and air to Teutons and Latins alike. And it is precisely at this point that Britain's Air Power becomes the decisive factor.

The New World's Affairs.

So far I have purposely omitted any consideration of America's share in this coming war, because it seems quite possible that America will be very busy about her own affairs. At the present moment those who are in power in Japan are our loyal and gallant allies, and are therefore without doubt equally attached to our friends in the United States. But it is quite within the bounds of possibility that in time an ambitious Japanese leader may arise who may induce his people to attack America.

It is said that already individual Japanese are acquiring great interests in Mexico, and that among those interests is a great factory in Mexico City for the production of explosives. Doubtless those explosives are for use in Mexican mines, but the factory might, in time of Mexican civil war, be put to other uses. The United States also has great interests in Mexico, and it is conceivable that those interests might clash with Japanese interests while at the same time Japanese and American interests in Manchuria and Korea gave rise to quarrels.

Thus it might come about that, despite the best endeavours of our present friends in Japan, a war might break out between Japan and the United States. The Japanese Fleet might clear the U.S. Navy off the seas before Mr. Secretary Daniels' proposed "greatest fleet in the world" becomes a fleet in being. And then Japan could land troops unhindered in Mexico, whence they could attack the United States over open country without having to surmount the Pacific Slope and cross the barrier of the Rocky Mountains.

Thanks to America's intervention towards the end of the Anglo-Franco-German war, the United States have a large partially-trained Army which has within it a nucleus of officers and men who have seen several months of active service and have been in several serious battles. For the same reason they have a large number of young men who know how to fly, and many firms which can build aeroplanes and aero-engines, together with several dozens of active-service aviators and several firms which now know how to build aeroplanes-of-war, though none of the said aeroplanes were actually used on active service. Thus the States are ready to-day to meet quite a considerable enemy force.

Japan, though her Army and Navy never participated actively in the European war, made use of the Siege of Tsing-Tao to put a number of divisions successively under fire, thus using the siege as a kind of advanced training school for troops. And so Japan also has a nucleus of men with war experience.

A Discouraging Experience.

I hope very sincerely that this mutual experience of war will tend towards peace between our friends in America and in Japan. But, judging from all past history, a slight taste of war increases the appetite for war, and a long peace is only produced either by conquest or by mutual exhaustion.

One would have thought that as East Prussia, Poland, Galicia, and Hungary have been the cockpits of some of the fiercest fighting in the recent war the inhabitants of those countries would have had their bellyful of fighting for a generation. Yet we see them still fighting as amiably as ever. It hardly seems likely therefore that as neither the Japanese nor the Americans have seen any fighting at all on their own territory for over fifty years the people themselves will be deeply opposed to further wars.

Therefore, while hoping that a Japanese-American war may not occur, it would be very unwise to assume that it can not occur. And so it would be still more unwise to reckon on any substantial help from America when the war between the Slavs and the civilised races of Europe actually breaks out upon us. Let us return therefore to the purely European outlook.

Time Estimates.

As I have said, none can even guess at the time when this race-war will begin. There was a period of six years between the outbreak of the French Revolution and the first rise to a prominent position of Napoleon, and even then he was only an Army-Commander under the Republic. So that if the Russian Napoleon is following a career exactly similar to that of his great predecessor he may still three years hence be only a young commander of a Bolshevik army whose name is unknown

A Zeppelin Product: A twin-tractor Friedrichshafen Bomber, Type F.F.62 (2-260 h.p. Mercédès).

to us in the West. For, be it remembered, we have never yet heard the name of any one of the Bolshevik leaders in the field, though from the recent defeats of Koltchak and Denikin it is obvious that the Bolsheviks must have some very good soldiers among them.

[Since these notes were written it has been reported that the C.-in-C. of the Bolshevik armies is a certain Kemeneff, formerly Colonel on the General Staff of the Tsar's Army.]

Can anyone say who in their armies corresponds to Kellermann, Jourdan, or Pichegru, of the armies of the French Republic? To those who wish to get a fairly correct view of the Russian situation I recommend strongly the reading of those volumes of MM. Erckmann and Chatrian, entitled "The Story of a Peasant," which cover the whole period of the French Revolution. The parallel to Russian affairs is seen therein as being much closer than any study of Carlyle would lead one to believe.

The introduction of railways, motor-cars, aircraft, and telegraphy (wireless and otherwise) might lead one to imagine that the rise of the Russian Napoleon will be quicker than that of the French Emperor. A similar line of argument led some people to think that these aids to rapid transport and communication would shorten future wars.

As a matter of fact they increased the length of this recent war because aeroplane scouts enabled the British Army to escape after Mons, and later enabled our Army Commanders to judge exactly where a big attack was coming, and to concentrate forces in defence by means of the other means of rapid transport. But for these aids the war would have been over, so far as the West Front was concerned, in the first six weeks. We might have carried on a Naval war, but it is much more likely that Messrs. Asquith and Co. would have made a reasonable peace and that Germany would have been left free to hammer Russia and so delay the Slav irruption for another ten years or so.

All for the Best.

Nevertheless, things may have worked out for the best after all. Despite the heavy losses of the Western races in this war, we have learnt a vast amount about modern war material which the Slavs have not. We have built up huge factories and masses of machinery which can be turned again to produce war material, which the Slavs have not. Our bitter experiences may be made of good account in preparing for the next war.

As in all previous irruptions of barbarians from the East, Western science and organisation will be pitted against mere masses of humanity. French quickness of mind and scientific attainments, plus British solidity of purpose and sound practical ability, plus German power of organisation, ought to be able to stave off any Slav invasion of Europe, albeit the effort required will be much greater and much more prolonged than that which was needed to finish this recent scrap of four years and a bit.

And because we shall need all the strength we can collect it is merely silly to talk about crushing Germany out of existence. As I said last week, Germany divided into her natural component parts will be a very valuable barrier. Germany crushed out of existence (if such a thing were possible, which it is not) would be merely a roadway over which the Slav could march into France. On which point it is well to remember that the much advertised German atrocities in France and Belgium were a mere game of kiss-in-the-ring compared with atrocities committed by Slav troops in East Prussia, Poland, and Galicia, and by Servo-Slav troops against Italians, and by Bulgars against Servians and *vice versa*. The mere Teuton is an infant in comparison with the Oriental when it comes to atrocitising. I only hope that my esteemed friend Captain Alan Bott, M.C. (better known as "Contact"), who is telling his Eastern experiences so well in "Blackwood" at present, will tell in the coming instalments some of the stories of Bolshevik atrocities which he collected while in Odessa and elsewhere after escaping from Turkey. He will help materially to prepare us for the next war if he does so.

A Matter of Longitude.

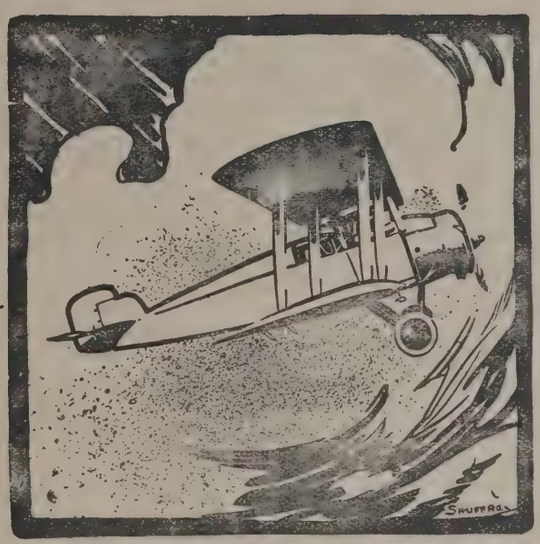
The German is by no means the savage which our yellow press would have us believe. (And be it here noted that in a few years or a few months' time the same yellow press will be telling us what a fine chap the German is—when our Jew financiers want us to begin trading with Germany for their benefit.) Witness for example how the Kaiser's sons, and the aged Field-Marshal von Hindenberg and the ex-Chancellor von Bethmann-Holweg all came forward and accepted responsibility when the ridiculous Peace Conferenciers proposed to try the Emperor for the sins of his subjects.

Supposing that the war had gone the other way and that the Central Powers had proposed to try King George for England's perfidiousness. Can you imagine Mr. Lloyd George offering himself in his master's stead, as von Bethman-Holweg did? I do not say for a moment that Mr. George would not gladly die, or serve a life sentence, in his King's place. But, can you mentally see him doing it? And whether you can or not, does not von Bethmann-Holweg's offer show him to be a loyal gentleman?

Whether we like him or not we have got to live in the same world as the German, so we may as well make the best of him. According to the Army of the Rhine, the German is not at all a bad neighbour, and he knows more about building a handsome and pleasant city than we are ever likely to learn.

The fact of the matter is that in whatever country you choose to make investigations you can find people who will commit outrages and atrocities. The only material difference is that the farther East you go the greater will be the percentage of atrocities in proportion to the population. A conscript army includes all the criminals as well as all the saints of the population. Even a British volunteer army will commit a certain small number of atrocities, as anyone who served in South Africa knows. A British conscript army of the same size will commit more. A German conscript army will commit a still higher percentage in proportion to its size. And a Slav conscript army will be worse again.

It is purely a matter of longitude. The farther East you go the nearer you get to absolute savagery and total absence of all morals. The low-water mark is reached in Russia, for when you get past Russia you arrive in China, where there is an ancient civilisation, and where there is an old aristocracy. Even the Chinese are fairly expert torturers, but that is part of their system of civilisation, and is not mere wanton beastliness as in the case of the Slav.



The Task Before Us.

When once the British nation has made up its mind that the Western Nations have to prepare for this race-war with the Slavs it will be easy to induce people to see the need for a big Air Force. Meantime, we who are intimately concerned with aircraft have upon us the burden of preaching the Gospel of Aeronautics henceforth until the war begins.

We ourselves can visualise our fleets of tanks, guided by their attendant air scouts, ploughing through and through the Slav hordes. We can see our great bombing fleets destroying Slav cities in a way that has never been

CIVIL FLYING

WITH

attempted in this war. We can imagine our reconnaissance machines searching over the great forests of Central Europe for the tracks of the Slav armies, just as the splendid pre-war German machines did just five years ago. But we cannot get the stupid British Public to see it, nor can we get the self-interested British newspapers to make them see it.

Therefore all that we aeronautical people can do is to go on preaching aircraft and the use of aircraft, for on us will depend most of the air work of the war, as it did in this war. Under the Peace Treaty, the Germanic States may not maintain a military Air Force, and their magnificent aircraft factories will have to be shut down. Already the Rumpler Works, one of the oldest aircraft concerns in the world, are in liquidation, and others are following while they still have money to save.

So it will devolve upon us to supply the Western Nations with aircraft in the really Great War which is coming. That will certainly be a fine thing for the British Aircraft Industry, but it will not be possible unless we can maintain an Industry and an Air Force in the years which are immediately ahead.

Commercial aeronautics will not develop into real business for some years to come. How then shall we retain our British Air Power in the immediate future?

The answer is, very simply, by doing everything possible to make flying a gentleman's sport, and not a mere vulgar circus show, and by combining sport and duty in building up a huge Territorial Air Force. The sporting aviator will join such a Force, and it, as it grows, will give work to the Aircraft Industry, and will maintain our supply of skilled mechanics. And so we may at least do something to prepare for that great Race War which may come upon us in the next five years, but may not break in its full fury for fifty years or more.

C. G. G.

ON THE WRITING ON THE WALL.

Among that excellent series of mnemonic rhymes on Hebrew history from which one has quoted samples in this paper from time to time is one which runs:—

"At the writing on the wall all the Magi stood appalled,
Till somebody suggested that Daniel should be called.
So Daniel *was* called, but merely remarked in passin':
'Ah! *Mene, mene, tekel upharsin!*'"

If one recollects rightly, the weird words in the last line being interpreted mean, "Thou hast been weighed in the balance and found wanting." And, as the Oriental Potentate to whom they referred refused to pay attention to the warning, his Empire (one cannot remember whether it was Babylon, Nineveh, or Assyria) expired shortly afterwards.

A Fair Warning.

We have just had a very similar warning in the form of that wonderful non-stop flight from Rome to London by Lieutenant Brack-Papa, of the Italian Army, on a S.I.A.-Fiat biplane, at a speed of over 160 miles per hour.

Are we going to heed the warning or are we not? The question is addressed equally to the British Aircraft Industry and to the Air Ministry.

For the last year we have patted ourselves on the back and prided ourselves on the fact that we held the Command of the Air—despite General Henderson's expressed opinion that such a command was impossible. And we had every right to do so, for the Germans were beaten out of the air, the French had no fighting aeroplanes worth mentioning, the first-class Italian machines were few and far between, and America had achieved the distinction of producing quantity devoid of quality. Great Britain at the end of the war stood alone as the leader of the world's aircraft design.

Since the war we have produced many excellent aircraft, and we have put up one or two fine performances, *but* we no longer lead as we did. As General Brancker said at the R.A.F. City Luncheon Club on Thursday last, other nations are overtaking us in the production of aircraft. The very performances on which we pride ourselves most have been beaten in one way or another.

Where We Are Beaten.

A British aeroplane was the first to cross the Atlantic without a stop, it is true. All honour to Sir John Alcock and Sir Arthur Brown. But their speed, despite a favouring wind, was far below that of Signor Brack-Papa's Fiat, which had no wind to help it, and in fact had the wind against it for much of the journey.

Also their time in the air—some 16 hours—was beaten before the war by Herr Rudolf Böhm on a Mercédès-engined Rumpler biplane, who flew for 24 hours 12 minutes without a stop.

To the Vickers-Rolls-Royce combination belongs the distinction of having covered the longest distance without a stop. Even allowing for the favouring wind that is at any rate a record of practical value, and not of purely sentimental interest, as is the crossing of the Atlantic *per se*.

It is of interest to note that the Fiat's journey was made with a single engine of 700 h.p. To this the phenomenal speed of the machine, and its capacity for carrying a big load at the same time, may be attributed. We in this country have not got a single engine of 700 h.p. When we want to carry a big load we have to sprinkle engines all over our machines in very inefficient positions, and so we are beaten on speed. Our tandem air-screw arrangement is about as bad as can be, despite the arguments of Technical Department "experts," but it cannot be avoided.

And though we have had designs for engines of 700 h.p. and more being hawked about the country for years, we have not got the engines. The Italians *have* got them. Hence our defeat in this exposition of high speed and long distance.

Similarly we pride ourselves on having produced the first airship to cross the Atlantic, and the first to go there and back. But the Zeppelin of 1917 did a longer and faster journey from Bulgaria to Central Africa and back. So, apart from a sentimental triumph, what on earth or in the air have we got to cheer about?

Who Is to Blame?

Readers may well ask, who is to blame for our losing our lead, and for this—the first and one hopes the last—of our defeats by our Allies in the air? Primarily, of course, the fault lies with the officials of the Air Ministry's Supply and Research Department as it is to-day, or Technical Department as it was, who cramp and crab private enterprise to-day as they did during the war.

Signor Brack-Papa has the honour of being the first to demonstrate publicly that an aeroplane can travel at 160 miles an hour. It is entirely the fault of the Air Ministry that the British Aircraft Industry was prevented from demonstrating in the Aerial Derby that we have several machines which can travel at speeds somewhere between 155 and 165 miles an hour.

This paper has constantly published accounts of the high speeds developed by the new French machines, such as the de Marçay and the Spad-Herbemont, and the new Italian machines, such as the S.I.A. and S.V.A., but the Air Ministry refused to permit the Bristol, Bat, Martinsyde, Nieuport, and Sopwith firms to prove that they were in the same or a superior class. We have not

heard the last of this Air Ministry imbecility, one hopes, but the harm is done. The Fiat people have shown the world that they have something better than we have, so far as public performance is concerned.

Where the Industry Fails.

Personally one believes that the British firms mentioned hereinbefore can beat our esteemed Allies if given a fair chance, but it would be foolish to put all the blame on the Air Ministry because they have not already done so. Surely the past five or six or seven years ought to have taught the British Aircraft Industry that it is not enough to beat the World in aircraft and aero-engine design and construction. That is comparatively easy. The real difficulty is to beat the various Government Departments which hinder progress and hamper business.

If after three years of neglect, four and a half years of war, and six or seven months of a devastating peace, the Industry has not learnt the gentle art of wangling, then it is quite time for it to look around for new business managers. Surely if the Industry desired keenly to prove the superiority of British speed machines it could combine to defeat the officials of the Air Ministry, who are in reality intensely stupid, as their actions and arguments over the Aerial Derby affair have proved.

If the Society of British Aircraft Constructors and the Royal Aero Club (which homologates all British records) combined to demonstrate and advertise to the world at large the wonderful performances of British aeroplanes the Air Ministry would be completely beaten. It may be true that the Industry cannot exist without orders from the Air Ministry. One doubts it, because there is plenty of business to be got abroad by any enterprising firm that goes the right way to work. But it is perfectly true that the Air Ministry cannot exist without the Aircraft Industry.

The war proved that Trade designs could always beat Official designs, and if the S.B.A.C. struck against the imbecilities of the Technical and Supply Departments the Society would have all the practical and active-service people in the R.A.F. in its favour. The question is whether the members of the S.B.A.C. trust one another. There seem to be doubts on the subject. But if the S.B.A.C. is a solid body, without any members who will sell the Trade in order to curry favour with the Air Ministry, then it can beat the Air Ministry every time.

Precedents to be Avoided.

One has only to recall how before the war the motor trade, the cycle trade, and other British trades were beaten by foreign competition to realise how grave is the danger to our Aircraft Industry to-day. We must avoid at all costs that foolish British custom of sitting down and saying to ourselves: "British stuff is the best stuff. Let the foreigner come and fetch it."

We have got to go and fetch the foreigner to look at our stuff. We have got to take our stuff for the foreigner to look at. We have got to demonstrate at home and abroad that our stuff is the best. We have got to force the Air Ministry to let us demonstrate that our stuff is the best. We have got to "git up and git"—to use the expressive American phrase. We have got to get over the habit of doping ourselves with self-satisfaction. We have got to get busy. We have got to prevent ourselves from being beaten in the race for Commercial supremacy in the air by Germany, France, Italy, and even by America.—C. G. G.

THE TROOPS' DAY.

The following was issued by the Air Ministry on July 16th:—

"In response to inquiries received, the Air Ministry makes it known that during Peace Celebrations there will be no relaxation of the General Safety Provisions (Para. 5, Air Navigation Regulations) in regard to flying over town areas or populous districts, either for the purpose of taking photographs or for any other purpose.

"On Saturday, July 19th, the date of the Procession, no flying whatever will be permitted over London within a circle of four miles radius from Charing Cross."

It is seldom that one has cause to disagree with Major C. C. Turner, late R.A.F., and with those excellent articles which he contributes to the "Observer." But for once one feels it necessary to do so.

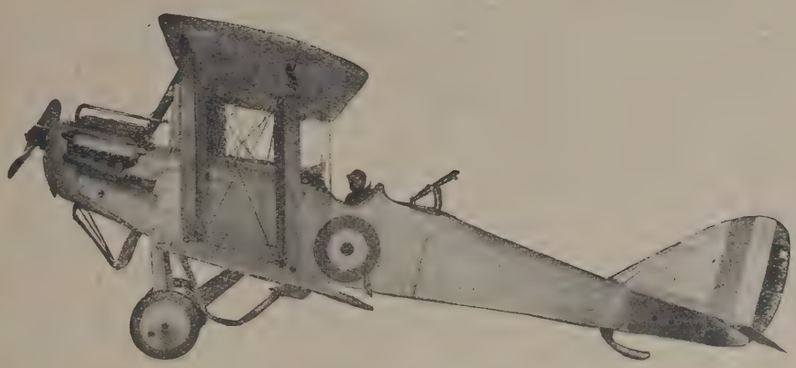
On July 20th he delivered himself of a strongly worded and richly deserved attack on the maladministration of Civil Aviation in this country, and showed clearly that civilian flying is suffering from "control amounting to oppression." But in the course of that attack at one point he confuses civil administration with military affairs and the public welfare, for he says:—"The prohibition of flying over London yesterday is a good instance of the state of the official mind. . . . It is not suggested that flying over London should be always permitted; there are good reasons why the prohibition should remain in force in normal times. But surely on Peace Day, when everything that can be done to signalise the greatest event in our history should be done, a few aeroplanes in the London sky (strictly ordered to maintain a safe altitude) would have been a fitting reminder and climax of the splendid work of the R.A.F. in the great conflict. But no: some pettifogging official had it in his power and had the meanness of spirit to cut it out."

It does not seem to have occurred to Major Turner, and to those who think as he does, that Saturday was essentially the Troops' Day. The British Army and the Allied troops, who were represented in the pageant, won the war. A detachment of the Royal Air Force represented the Naval and Military sections of the R.A.F. in the procession.

It would have been a breach of Service courtesy for R.A.F. aeroplanes to have flown overhead and to have diverted to themselves any of that attention which belonged by right to the troops on the ground. And if civilian aeroplanes had done so it would have been a gross impertinence.

Furthermore, on the minor point of public welfare, no altitude at which an aeroplane would be visible could have been safe on such a day. Every open space around London was filled with people making holiday, and an engine failure would have meant a descent either into the river or into a crowd.

Yet another good reason for prohibiting flying over London is that the occasion was not one on which it was seemly that officers of the King's Armed Forces should provide light entertainment for the mob. It is a regrettable fact that when portions of our victorious Army marched through London some weeks ago certain pilots so far forgot their positions as officers and gentlemen as to perform like circus clowns in the vicinity of Trafalgar Square and the Strand. With the R.A.F. in its present state the only guarantee against a repetition of such antics seems to be the total prohibition of flying. Doubtless when the R.A.F. contains only officers with permanent commissions, or with temporary commissions which they hope may become permanent, such safeguards will be unnecessary.



Some day perhaps the Royal Air Force may, in its reorganised state, provide for the people a pageant of its own at some great aerodrome where the populace may see it in its proper element and under seemly conditions. But the Troops' Day over London did not provide the time nor the place for a demonstration by the Royal Air Force.—C. G. G.

A REAL AID TO AVIATION.

£10,000 FOR RELIABILITY FLIGHTS.

"DAILY EXPRESS" OFFER.

AERIAL TESTS TO THE ENDS OF THE EMPIRE.

TO CARRY CARGO.

New Methods for Empire Commerce.

Now that the Atlantic has been bridged by air in both heavier-than-air and lighter-than-air craft, the next step is to prove the practicability of commercial flying within the Empire. With this object in view, the "Daily Express" offers a prize of £10,000 not only to prove the feasibility of commercial flying within the Empire, but also to bring the outlying portions of the Empire into infinitely closer touch with the Mother Country. Australia has offered a similar prize to the first aircraft to fly there from the United Kingdom. There remains, therefore, the task of establishing aerial communication on a commercial basis with South Africa and India. This task the "Daily Express" proposes to carry out.

CONDITIONS.

In general, the terms and conditions of this £10,000 competition may be outlined as follows:—

(*a*) All types of aircraft are eligible for entry.

(*b*) *The competition is open to all the world, except late enemy countries.*

(*c*) All aircraft entered must carry a useful load of at least a ton both on the outward and homeward flights.

(*d*) Each entrant must produce one aircraft for the flight to and from South Africa, and one aircraft of a similar type for the flight to and from India.

(*e*) The factors considered in the award will be:—

Average reliability.

Airworthiness and general conduct of aircraft entered.

Average gain in speed over the established means of transport.

(*f*) As it is aimed that each aircraft shall carry a useful load of saleable or exchangeable commodities or raw materials, it will be to the advantage of competitors to study the commercial situation as affecting this interchange.

(*g*) Particulars of entries will be announced within the next few days.

(*h*) Competitors may undertake the flights at any date between the closing of the entries list, which will be announced later, and June 1st, 1920. Priority in completion will not prejudice the success of later but obviously more efficient performances.

(*i*) One complete failure by a competitor will involve disqualification for the award.

EMPIRE UNITY.

Further instructions as to the particulars and conditions of the competition will be announced later.

In making the preliminary announcement, however, it is in order to point out the importance to the Empire and to commerce of these unique reliability trials. In the first place, they will demonstrate the fact that aircraft is capable of bringing South Africa into as close touch with the heart of the Empire as Canada is with the fastest traffic by sea. These trials will demonstrate also that India is only a week away from London instead of a month, and this for sustained traffic, not for sporadic "stunts."

The political consequences of this achievement will be enormous. It is no exaggeration to state that the carrying out of the "Daily Express" £10,000 competition will lead at once to a new and great link of Empire. But it is not only from sentimental and patriotic reasons that these trials are pregnant with possibilities. With a world shortage of shipping that must persist for some years, and with the existence of great facilities for aircraft production, once the commercial value of air transport over great distances is established, an enormous step will have been taken in solving the admittedly difficult international economic situation which is a legacy of the world war.

At last a big prize has been put up for competition which will be a real incentive to aeronautical progress. Hitherto, with the exception of the Mortimer Singer and Michelin prizes, such prizes as have been offered have been more spectacular than useful. Thanks to assiduous booming, the "Daily Mail" prizes have roused the populace to a brief intense interest in specific "stunts," but the interest has been fleeting, and personally one has never been able to see that any permanent benefit has been conferred on British aviation by these semi-hysterical outbursts.

When the "Circuit of Britain" competition was the centre of sensation in 1911 one pointed out that the prize-money might have been offered in a manner more advantageous to aeronautical progress, but it was explained to one that the idea was to work up a big boom and then get it all over before public interest flagged. The policy seemed sound from the donors' point of view. One cannot scream at the top of one's voice for more than a limited period, and one bows to the "Daily Mail's" experience of mob psychology.

Now, however, British aeronautics has been offered a prize which is a real encouragement to enterprise. On July 16th the "Daily Express" announced that it offers a prize of £10,000 for a series of flights from England to India and England to South Africa and back.

The offer is made by the "Daily Express," a paper which from the earliest days has taken a sane and intelligent interest in aviation. It has never been hysterical over successes, and it has never been depressing over failures. It has not boomed fatal accidents, nor buried good performances. It has treated aviation as a coming method of transport and as an important factor in war.

Before the war the "Express" gave strong support to the needs of the Flying Services, and during the war it did great work in supporting agitations for the good of the Services. Mr. Blumenfeld, the Editor-in-Chief, and Mr. Wilson, the News Editor, have been for years keenly interested in flying, and have dealt with the subject in a sound and sensible way which should have been an example to the rest of the daily Press. To-day they are dealing with the giving of this handsome prize in an equally sound and sensible way.

One confesses to lamentable ignorance as to the precise period at which Lord Beaverbrook, better known as Max Aitken (and in Canada, one is told, as "the cement pier"), became a prevailing influence in the "Express," but it is generally supposed that he is practically the "owner," and such being the case it is only fair to attribute to his personal generosity and foresight a large share of the credit for this handsome gift to aeronautics and for the ideas which are behind it. Lord Beaverbrook has his enemies, as have all successful men, but even his enemies acknowledge his cleverness, and others who are neither his enemies nor personal friends say that he has one of the most brilliant brains of the century.

There is, it is true, nothing particularly brilliant in the idea of offering a £10,000 prize for aeronautics. It has been done before. But, and here is the real point, there is something brilliant in taking an old idea and getting out of it something far more useful than anything it has produced before. Lord Beaverbrook and his colleagues in this scheme deserve well of the people of the Empire.

One's only regret is that aircraft of recently inimical countries are barred. Such elimination of dangerous competitors seems rather a confession of weakness, for surely, if our aircraft are as good as we believe, we need not fear German competition.

Here is the announcement of the prize as published in the "Daily Express" on July 16th:—

On July 17th the "Express" published the following supplementary notes:—

INDIA.

Peculiar importance is attached to the flight to India for these reasons:—

(*a*) The vast potential possibilities of India commercially to the Empire.

(*b*) The delay in both sea and cable routes to India, which has been greatly aggravated by the war. This delay will continue for years to come, to the detriment of both the United Kingdom and India.

(*c*) The fact that it is now established that the defence of

the Indian frontiers in the future will rest chiefly in the air. The establishment of commercial air routes to and from India will have an enormous moral effect throughout the East, and may well eliminate the possibility of hostile incursions such as that recently undertaken by the Amir of Afghanistan.

SOUTH AFRICA.

South Africa also is keenly alive to the great mutual benefits, both material and sentimental, which will accrue from regular aerial transport to and from the Mother Country.

It is gratifying to note the sympathy shown to the project by prominent Canadian officials in London, despite the omission of Canada from the routes suggested. As stated in the preliminary announcement, this omission was due to the fact that the utility of trans-Atlantic traffic has already been demonstrated. Mr. Lloyd Harris, chairman of the Canadian Mission in London, writes to the "Daily Express":—

"I desire warmly to congratulate the 'Daily Express' on its vision and enterprise in seeking by so generous a prize to encourage aerial intercourse within the Empire. I have just returned from Canada to my work in London, and I feel that my countrymen will welcome the plans announced this morning in the 'Daily Express.' The swifter and more complete the means by which each part of this existing League of Nations known as the British Empire may know each other, the greater will be the future prosperity of all."

One gathers from other paragraphs in the "Express" of the 17th that the Royal Aero Club, by way of its Secretary, Mr. Harold Perrin, approves of the prize. In the nature of things the R.Ae.C. will have the regulation of the competition. It is to be hoped that it will handle it with greater intelligence and enterprise than it has shown in the matter of the Australian £10,000 prize or the Schneider Cup competition.

Meantime, one commends the "Express" competition to the Aircraft Industry. At first sight the rules appear to favour airships. Perhaps they do. But, after all, aerial communication will fall into the hands of those best fitted to deal with it. If the aeroplane cannot beat the airship in this competition, then it proves that the airship is the best aircraft for the job. If so, then good luck to it.

In any case the proprietors and the management of the "Daily Express" deserve the cordial thanks of all concerned with aeronautics, not only for having put up one of the biggest prizes offered, but also for arranging a competition which will be quite the most useful to the development of aerial navigation.—C. G. G.

THE DEATH OF LIEUT.-COL. POLLOCK.

Those who have long been concerned with aeronautics and many of the younger airship officers will learn with deep regret of the death of Lieut.-Col. C. F. Pollock, O.B.E., A.F.C., on July 17th.

Colonel Pollock was one of the keenest amateur balloonists of his generation, and almost certainly held the record for the number of trips across the English Channel in free balloons. His first crossing was made in October, 1897, and, according to that excellent early book on lighter-than-air craft "The Boys' Book of Airships" by Harry DelaCombe (now Lieut.-Col. R.A.F.), he had crossed the Channel by balloon eleven times before M. Blériot made his famous crossing by aeroplane.

As soon after the outbreak of war as the Navy began training airship personnel, Mr. Pollock (as he then was) offered his services as an instructor in the handling of free balloons in the air, a very necessary preliminary to the navigating of airships. He was appointed Flight Lieut. R.N.A.S. Later he became Squadron Commander R.N.A.S., and ultimately Lieut.-Col. R.A.F.

Though by no means a young man, he made constant journeys in R.N.A.S. balloons, taking with him classes of aspirant airship officers, on occasion having as many as six pupils in the car at a time. Thanks to his able and sympathetic instruction, in the art of which he was an acknowledged master, a number of young men were thus taught the essentials of a branch of the King's Services which has done most valuable work in assuring the safety of seaborne supplies during the war. And nobody has better deserved the promotions and decorations conferred upon him than did the late Colonel Pollock.

After several years of this strenuous work Colonel Pollock's health became seriously affected, and of late he has suffered from rapid creeping paralysis. He realised recently that he had but a few months at most to live, and that towards the end he would be quite paralysed. Therefore on July 17th he took his own life.

Doubtless the verdict will be the conventional one of suicide while temporarily insane. It would seem more reasonable to regard Colonel Pollock's death as that of a brave man who preferred to leave this life quickly and in full command of his faculties rather than to remain a little while longer as a burden to himself and to those dear to him. None can doubt his courage or nerve. His Service career has proved both. His manner of ending his life was the supreme proof of those qualities.

As to the cause of his breakdown in health, it seems that here is a case for study by the R.A.F. Medical Service. Much has been heard of the effect of constant flying at great altitudes by aeroplane pilots, and it has been said that a species of temporary paralysis is caused by an excessive amount of such work. One has ventured to suggest on previous occasions that there may be some analogy between this effect and "caisson disease" from which divers suffer owing to the rapid changes of air pressure which they experience in the course of their work. It seems possible that in the case of a man of Colonel Pollock's age the lesser altitudes reached by the balloons used for training might have even greater effect than the immense altitudes reached by active-service aviators would have on a younger man. Also, it seems probable that effects which would be merely transitory in the cases of younger men possessing youthfully elastic tissues would be permanent in an older man who had passed the age when physical recuperation is possible.

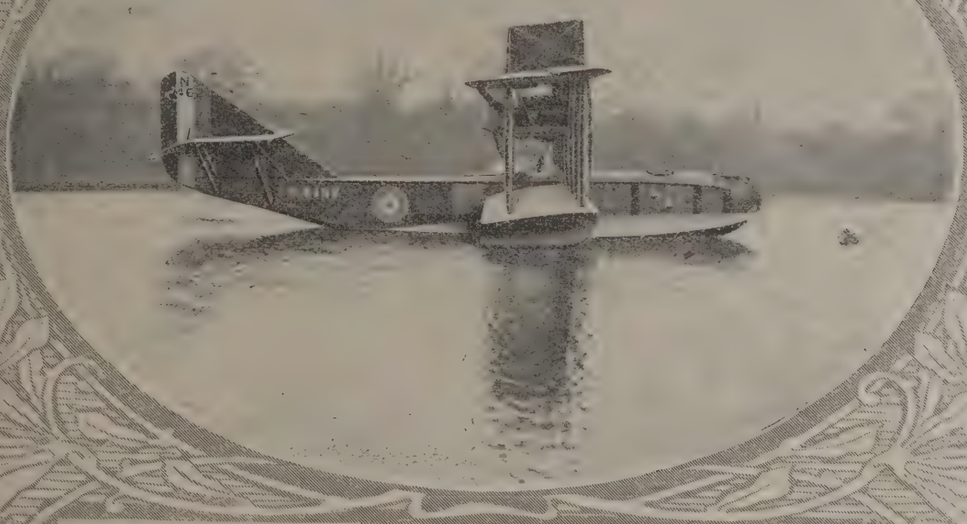
The older members of the Royal Aero Club will ever remember Colonel Pollock as a good friend, as a pioneer of British aeronautics, and as a sportsman of nerve, resource, and determination. The Airship Service will revere his memory as of a kindly and diligent instructor of youth who has deserved well of his King and Country. May he rest in that peace which he went to seek.

C. G. G.

PAY IN THE ROYAL AIR FORCE.

The Air Ministry announcement concerning the pay of R.A.F. officers under the reorganisation scheme appears in its proper place in the Naval and Military section of this paper, on page 370. Therein it will be found that in future R.A.F. officers will, as promised by General Trenchard, be able to live on their pay.

An interesting point is also disclosed in General Seely's statement on page 364, where he states that flying pay, as such, is abolished, as all officers in the future will be flying officers—which is as it should be. On the whole, the pay scheme seems very satisfactory, especially for junior officers.



FLYING BETWEEN LONDON AND PARIS.

The following announcement was received from the Air Ministry too late for publication in the last issue:—

The instructions issued on 12th instant relating to the opening of civil communication by air between London and Paris from July 13th-20th inclusive are now modified by arrangement with the French Government in the following respect:—

During the stated period British pilots and passengers will not require to be provided with passports, and His Majesty's Government have arranged to give the same facilities in regard to French pilots and passengers.

EAST COWES, I.O.W.

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS SBAC

The WORLD of AERONAUTICS

NEWS OF THE WEEK FROM ALL QUARTERS

A Visit from the King of the Belgians.

On July 16th H.M. the King of the Belgians flew from Brussels to Hounslow, en route for Eton College. The visit was unofficial, the object being a visit to Prince Leopold. King Albert returned to Belgium by aeroplane the following day.

Purring over Parliament.

The Glasgow "Evening Times" is disturbed over the possibility of our legislators being disturbed from their slumbers. One of this news-sheet's contributors has written :—

"It would not be surprising, I think, if the Speaker, or whoever the authority be, were to issue an order prohibiting aircraft flying over the Houses of Parliament. Speakers in either Chamber are never interrupted by the noise of outside traffic, not a murmur of which penetrates the sacred precincts, but it happens occasionally nowadays that an aeroplane purrs directly overhead, causing momentary interruptions."

One certainly agrees that the practice of flying over the "sacred precincts" should cease. The profane purr of an aeroplane might remind our legislators that, in spite of all their efforts, they have not yet succeeded in killing civil aviation, and further repressive measures might be taken. Commercial aeroplanes should purr quietly like Pussyfoot if they are to escape further attention from Parliament.

Truthful.

An ex-pilot who had applied for a civil flying job was having his knowledge of aeronautical matters tested by the manager of the firm. When asked to describe the method of lubrication of a certain well-known engine he replied : "Drip feed onto the pilot's right foot." He obtained the vacant post.

A Journalistic Break.

The "Evening Standard" announced on July 16th that Lieut. Madon would carry the French Air Service flag in the Victory March. The newspaper favoured its readers with the following priceless information :—

Lieut. Madon in August last had 40 air victories to his credit. One of his most thrilling exploits was an enforced landing behind the enemy lines in 1917, when he was attacked by a German patrol of twenty men. He leaped into his seat, loosened the brakes with his feet and one hand, adjusted his machine-gun with the other, and charged the patrol at ever-increasing speed. After mowing them down he headed for the French lines in safety.

One would have liked further information about the brakes which he loosened with his feet and one hand. It is true that the old Voisins had hand brakes on the hubs of the landing wheels, but why were feet necessary to release them?

The Flying Coach.

A writer in the "Oxford Chronicle" is responsible for the following :—

"The prospect opens up new vistas of Eights Weeks and Commemorations. The flower-laden barges and the parasols and the brilliant dresses will still stand out in clumps; the canoes will be dexterously manœuvred amid the heavier river-craft, and the forest of punt-poles will sway and wave as the course is cleared for the eights; the perspiring rowers will still swing to and fro, and the banks will still have their sweltering runners, causing the air to reverberate with their yells and their rattles and their bells and their pistols.

"But the coach will have come into his own. Comfortably flying above his boat, his megaphoned instructions will be conveyed to his crew, and above the din stroke will be told to quicken or to lengthen out; and the heavy man at 'six' will hear again the phrases he is so tired of hearing about 'pulling his weight'; and the cox who has just missed his bump will be able to complain that the moment for that twitch at the rudder which spoilt everything was not the moment of his own choosing."

There are, however, obvious difficulties. The sight of aeroplanes flying sufficiently close to the boats to enable the crews to hear megaphoned instructions above the roar of the exhaust would be exciting, but one fears that there might be some unintentional bumps. Also, there might be some difficulty in inducing the aeroplanes to fly at the very low speed required.

If the writer of the article really wishes to see brighter rowing, he should suggest that the eights should tow behind them small kite-balloons carrying the coaches.

When the Divers Dove.

According to the American "Aerial Age," "the 'Guardian Angel' parachute, officially adopted by the British Royal Air Force as the most certain aerial life preserver yet invented, was demonstrated at the Atlantic City Airport on June 19th by Major Ordo Loos, R.A.F., and Miss Sylvia Boyden, of England (*sic*).

"They ascended to a height of one thousand feet in an aeroplane piloted by Eddie Stinson. After circling for a moment both Major Loose and Miss Boyden dove head first from the machine."

After they had "dove" they controve to make good descents and arrove safely on the aerodrome. "Major Ordo Loos," afterwards referred to as "Major Loose," appears to have had a slight accident to his name during the descent, but has recovered sufficiently to identify himself as Major Orde Lees.

The Engines in R.34.

One was amused last week to see in the public newsheets large advertisements of the particular brand of chewing gum that was used to stop a small leakage from one of the water-jackets of the Sunbeam-Coatalen "Maori" engine on the starboard wing car of the R.34 during the historic Atlantic flight.

As is the custom with advertisements in which self-praise is a recommendation, it is stated that the chewing gum in question proved a big factor in the success of what are inaccurately described as the "world's greatest airship flights."

This suggests some appalling advertising possibilities in the future, and we may live to read claims that the success of the first flight from Britain to Australia was entirely due to the superb quality of the scented toilet soap with which a member of the crew cured a minute leakage of petrol, and that the accomplishment of the first aerial circumnavigation of the globe was made possible by the resilient qualities of Dobb's Doughnuts, which were used to replace some broken shock-absorber elastic.

The true story of the much-advertised chewing gum incident has been told by Mr. J. T. Irving, of the Sunbeam Motor Car Co., Ltd., who writes :—

"On my arrival at Pulham, I immediately examined the starboard wing car expecting to find the engine covered by pounds of chewing gum which had been thoroughly chewed previously by the crew before application. To my surprise I could not find a piece of chewing gum anywhere, and, at my request, the mechanic in charge of the engine showed me where this remarkable repair had been effected.

"The water-jackets on the 'Maori' engine are largely composed of flat aluminium plates which are held onto the cylinder by means of a large number of small set screws. It seems that one of these screws was also used to carry a clip supporting a copper pipe, and that in flight it was noticed that this clip was loose. When the mechanic tightened up the screw he twisted off the head of the bolt. This allowed a very small leakage of water —this leakage being in the nature of one drop of water per minute. As the mechanic had so little to do, owing to the steady running of the engine, he set to work and fitted a small plate over this, the plate being secured under the heads of the two adjacent screws, and, just before tightening the screws, he had a brain-w[illegible], and took the piece of chewing gum out of his mouth and slipped it under the plate. Evidently, General Maitland did not see this repair before making his famous log entry, which was probably based on some remark of Lieut. Shotter's.

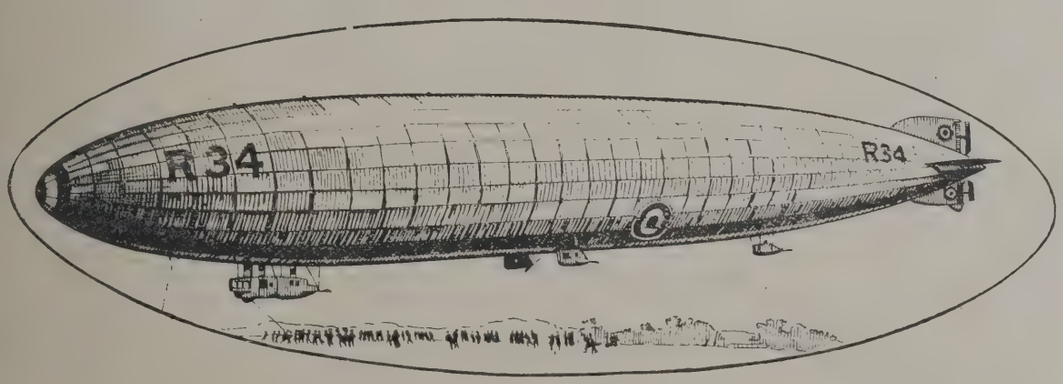
"The five engines between them have put up a total of approximately 900 hours' running, on this trip only, to which must be added over 600 hours' previous running."

With regard to the failure of one of the engines in the rear car, Mr. Irving writes :—

"The failure of the studs in the big-end bearings of the connecting rod was caused by allowing the engine to run after the white-metal had run out of the bearing. This, of course, renders a failure of this description inevitable.

"The reasons for the white metal 'running' at present are somewhat obscure, as the crew state that the oil pressure was correct at the time of the breakdown, but a point which may have some bearing on the failure is that previous to the actual breakdown of the engine, the engine was caused to race to a high speed owing to an accidental declutching. It is probable that this cracked the white metal in the bearing, and it would, of course, only be a matter of time before this broken metal was hammered out. Up to the time of this mishap the engine had run somewhere near 300 hours."

"IT'S A WALK OVER!"



That's the only way to describe the superiority of

The WORLD of AERONAUTICS (continued)

The Trans-Atlantic Martinsyde.

Mr. Raynham and his navigator, Lieut. Biddlecombe, made another attempt to start on the Atlantic flight on July 17th. The attempt ended as the previous attempts have done.

The Martinsyde rose to a height of 40 ft., then sagged down and crashed, completely wrecking the machine. The axle of the under-carriage snapped and both wheels wrenched off. The air-screw was splintered, the radiator torn out, the aluminium tanks split, and the lower planes shattered at their junction with the fuselage; the latter is also badly damaged. The aviators were unhurt.

The cause would appear to be failure to lift the weight of fuel required for the voyage.

Mr. Raynham has now decided not to attempt the flight. The Martinsyde is now being packed up preparatory to sailing for England. The voyage will be made in s.s. "Grampian."

The Dramatic Instinct.

There is something indescribably ludicrous about an airship, her ungainly bulk, her clumsy manœuvring, and crab-wise progress in a breeze, making her a fit subject for the often ponderous wit of ignorant observers. The aeroplane, on the other hand, conveys an impression of speed in flight and venom in war, inseparable from the noise of the engine. There is a thrill in the crossing of the Atlantic by an aeroplane which is unaccountably absent in the accomplishment of the same feat by an airship, although there can be no question which is the more valuable performance for the immediate future of aerial transport.

Notwithstanding the air of aloofness assumed by technical people, public interest and a good "Press" must play a big part in the development of commercial aviation, and the only way to attract that necessary vulgar attention is by providing material for thrilling headlines, either intentionally or otherwise.

The Air Ministry are to be congratulated upon the extraordinary concatenation of circumstances brought about by a kindly Fate, which have served to raise the magnificent scientific feat of the R.34 from the level of a technical experiment to the giddy pinnacle of fame represented by "scare" headlines in the evening papers. A stowaway, electric storms, distress signals, and a final berthing on the last (almost) drop of petrol, "sweeping the bunkers," as a seaman would say, all made excellent material for the lay Press.

Without such good fortune, the "swinish multitude" might have remembered the voyage of L.59 last year into the heart of Africa, and made, in its ignorance, derogatory comparisons. The quite unintentional publicity might, however, have been augmented by a little deliberate forethought, and this suggestion is worthy of note by other aviation concerns who have sinned in the same manner recently. The week-end is a "dead" time from the newspaper point of view, and should be avoided. Very few people see the Sunday evening papers, and by Monday morning the news tends to become stale.

It is most surprising that the Air Ministry should have overlooked this point, because, under the present régime of Business Government, it has hitherto shown a keen appreciation of the great uses of advertisement. Its skill in appropriating much of the credit of Mr. Hawker's sensational failure, after repudiating all responsibility with indecent haste when things looked black, was a stroke of business which would have delighted the heart of a shady company promoter.

That the dramatic instinct is not dead is obvious, but it is to be hoped, both in the interests of journalists and the Ministry's reputation, that the week-ends will be avoided as times for the provision of good "copy."—EX-PILOT.

Trans-Pacific Flight Prize.

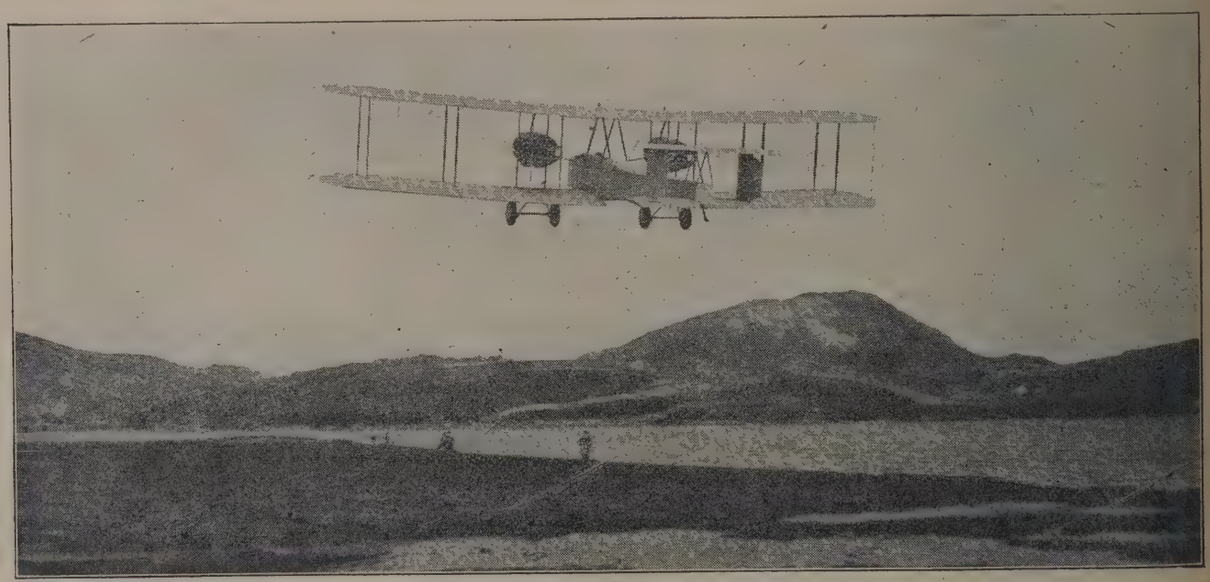
A prize of £10,000 has been offered by Mr. Thomas H. Ince, of Los Angeles, California, for the first trans-Pacific aeroplane flight by an aviator of any nationality. If the attempt is made from the east, Venice, California, must be the starting point, and the landing must be on the mainland of Australia, Japan, or Asia. If made from the west, a start may be made from any of the latter places, and a landing on the mainland of the United States.

The contest will be open from next September to February, 1920. The flight must be completed in 12 days.

Aeroplanes and Forest Fires.

It is reported from the United States of America that after some preliminary reports concerning the possibility of using aeroplanes as an auxiliary in the work of protecting forests by fire, it is now definitely announced by the U.S. Forest Service that the Air Service and the Forest Service will co-operate in work of this character during the coming summer in portions of the national forests of California, Arizona, New Mexico, and other states. Army aerodromes and bases will be used for the undertaking, which will be largely experimental during the coming season. Besides supplementing the work of the forest rangers in locating forest fires, attempts will be made to utilise aircraft in connection with fire-fighting. One plan to be tried is the use of bombs filled with suitable chemicals as a means of extinguishing fires from the air. It is also suggested that fire-fighters may be carried to the vicinity of fires in dirigibles, and lowered to the ground by means of ladders. Aeroplanes will use wireless for reporting the location of fires.

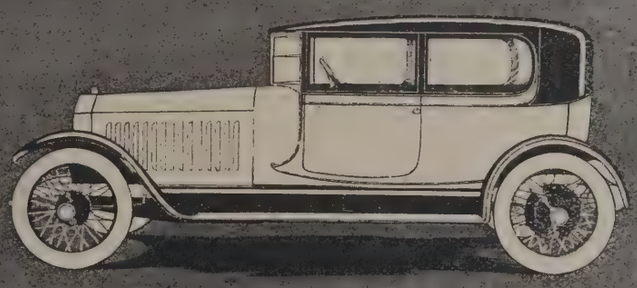
A Warning.



Apropos tennis at Wimbledon, an ex-R.A.F. officer, who is also a keen tennis-player, writes:—

"The Air Force greatly distinguished itself there. During the final of the all-comers single between Kingscote and Patterson, a Bristol Fighter (I think it was) came and stunted round the centre court at about 200 feet to such an extent that play had to be stopped, and then, to crown things, it dropped Victory Loan leaflets, some of which actually fell on the court! Kingscote, who, of course, was an 'Archie' gunner, looked as though he would have given half his kingdom for an 'Archie' at that moment."

The Airship Officers' Club Dinner.



The Airship Officers' Club is giving a dinner at 7.45 p.m. on July 26th at the Connaught Rooms, Great Queen Street, W.C.2. General Maitland, President, and Major Scott and Major Cooke and the other officers of R.34 will be present.

Anybody desiring information should write to Captain C. P. Herron, Hon. Sec., Airship Officers' Club, 4, Dean Stanley Street, S.W.1.

The WORLD of AERONAUTICS (continued)

The R.A.F. City Luncheon Club.

The members of the ex-R.A.F. Officers' City Luncheon Club held a special Victory Luncheon Party on July 17th to celebrate the part played by the R.A.F. in the war.

Major Modin, the chairman and founder of the Club, in proposing the success of British Aviation, said that this was the Club's first official function, and that they had met to celebrate that victory to which each had contributed in his own sphere.

Major-General Sir Sefton Brancker, replying, reminded those present that Great Britain held the paramount position in the air. This country had led the world in its air policy, first of all in giving aircraft the position warranted by its effect during the war, and later by being the first nation to create an Air Ministry and an Air Force, though he added in an aside, "Some of them might think this a doubtful blessing." Great Britain had followed up her success in the war by success in peace, in that a British aeroplane was the first to cross the Atlantic without a stop, and that a British airship was the first to cross the Atlantic and the first to do the journey across the Atlantic and back. He further said that we owed our success to the courage and initiative of our pilots, and he believed that in commercial aviation British pilots would lead the way in the air as British sailors had done at sea. Not only were we good at organising schemes in this country, but we were good at executing them, and the life-blood of commercial aviation would be organisation. Our success in the war was due to our policy of constantly changing our designs. [One may perhaps interpolate the remark that, if the official people had had their way, designs would hardly have been changed at all, and our rapidity in changing designs was largely due to continual agitation.]

General Brancker remarked that the situation to-day was extremely difficult. Much preparation was needed before the world's air routes could operate. The Air Ministry was torn between the demands of those who believed in aviation and the Treasury, which, as he said, had not yet been bitten by the aviation bug. Much money was needed for the formation of air stations all over the world, and private enterprise could not find that money, therefore the Government must assist. Other countries were waking up and doing their best to overtake us in aircraft affairs. He was certain that the Advisory Committee under Lord Weir, which was recently formed, would be most valuable, and it was up to the various members of Parliament who were present to see that aviation got its due allotment of the public money. He felt sure that this Club would do much to affect the Air Force Reserve whenever it came into being.

Lieut.-Colonel Moore-Brabazon proposed the success of the Club in a very humorous speech, and said that the next time the Club met he hoped that he and other members of Parliament would not be placed above the salt, but would be distributed among the other members of the Club. He thought the Club would be an excellent thing, because now that they were all civilians, senior and junior officers would meet on equal terms for once. He hoped that all members then present would in a year's time have induced at least two ex-R.A.F. officers to join. The essence of the Club was to get as many members as possible and so keep the Air Force people together.

Mr. Leslie Guyer, secretary of the Club, said that the Club was formed because it was thought that it would be advisable for them to have some sort of a reminiscence of the old R.A.F. mess. It would be a good thing to have a nice quiet place where they could lunch in peace as they did in an R.A.F. mess before people thought fit to make peace, instead of having to take part in the mid-day lunch struggle in the City. Another ulterior motive was that they hoped it might be possible in time to provide a certain amount of flying for the members, and he thought that this might well be arranged if the biggest proprietors of secondhand aeroplanes in the country were properly approached.

Among those present, in addition to those already mentioned, were:—Lieut.-Col. L'Estrange Malone, M.P., Mr. A. Baldwin Raper, M.P., Colonel W. D. Beatty, R.A.F., Sir Edward Mountain, Sir Charles Wakefield, Bart., and Mr. W. Joynson-Hicks.

It is earnestly to be hoped that the Club will be keenly supported by all ex-R.A.F. officers now engaged in work in the city. In the first place, it is obviously a good thing that officers of the Air Force should keep together to maintain their old comradeship. In the second place, there can be very few ex-officers who would not be pleased to have such an opportunity of meeting day by day those with whom they served during the war, and it is not every ex-R.A.F. officer who has either the time or the inclination to go to a club in the West End, whereas everybody has to have lunch somewhere, and a lunch-hour spent in congenial company is the best possible break in the day's work. Thirdly, if the Club grows to a sufficient size it will be possible for the members to lunch very much less expensively at such a club than they could possibly do at any restaurant.

Purely as a business proposition any of the large catering firms will give very special terms to members of such a club if a sufficient number of meals per day can be guaranteed, and one imagines that the more enterprising caterers would willingly make a specially-cut price for a club of this sort knowing that even if there are only a few members at the start, the fact that they provide good value will rapidly increase the demand, with the result that it will be possible for members of the Club to have a first-class lunch at a third-class price, seeing that the objection to the third-class lunch is generally the company and not the catering.

Therefore from every point of view it is worth the while of ex-R.A.F. officers in the city to join the Club, and all such are invited to write forthwith to the Secretary, Mr. Leslie Guyer, at the ex-R.A.F. Officers' City Luncheon Club, Mansion House Station Restaurant, E.C.

A Curious Position.

At the Wandsworth County Court, on Monday last, before His Honour Judge Harington, an interesting case was heard under the Workmen's Compensation Act.

The action arose out of an agreement between Whitehead Aircraft (1917) Ltd., aeroplane manufacturers, of Richmond, and Horace John Roberts, a sawyer, formerly in their employ.

An application was made to his honour for an order directing Mr. E. S. Salaman, the company's solicitor, to pay into court forthwith £225, being the amount agreed upon as compensation in respect of an accident sustained by the applicant while in the company's employment. Mr. Roberts' left hand was practically rendered useless through being caught in a circular saw. Afterwards the company agreed to pay £175 as compensation. The Registrar of the Wandsworth County Court (Mr. Willoughby), however, did not think that this sum was adequate, and recommended that £225 should be paid in settlement. An agreement to this effect was filed, and a request had since been made by the applicant that this sum should be paid into court. That had not been done, and the judge was now asked to direct that the money should be paid into court forthwith.

Mr. Hartley read an affidavit by Mr. Salaman stating that he (Mr. Salaman) had received a sum of £225 in banknotes from the Whitehead Aircraft Company for payment. In view of the financial position of the company, Mr. Salaman was of the opinion that he ought not to part with the money, as it might be considered a fraudulent preference. On June 26th a receiver and manager of the business of the company was appointed on behalf of the trustee for first mortgage debenture holders, and Mr. Salaman's firm now acted for the receiver and manager appointed under the order of the Court. He (Mr. Salaman) had since received instructions from the receiver and manager not to part with the £225 without the directions of the High Court.

His Honour said that it certainly seemed very hard on the workman that this money had not been brought into court. There was, however, no suggestion of contempt, as there had been no order. What authority had he to order Mr. Salaman to pay over this money?

Mr. Hartley: Your honour is entitled to make an order on the ground that Mr. Salaman received this money before the receiver and manager was appointed by the High Court. If the company had paid the money into court, this position would not have arisen.

His Honour: It is a pity that they did not do so. It will be grievously hard on the workman if he cannot get the money. As the case was to come before the High Court, the matter was allowed to stand over to see what was done.

Congratulations.

FLANDERS.—On June 30th, at 27, York Gardens, Clifton, Bristol, to the wife of Mr. L. Howard Flanders, a son.

Coming Events.

JULY.

Saturday, July 26th.—July Meeting at Hendon.

Saturday, July 26th.—The Airship Officers' Club Dinner at the Connaught Rooms.

AUGUST.

Friday, August 1st.—Amsterdam Aircraft Exhibition opens.

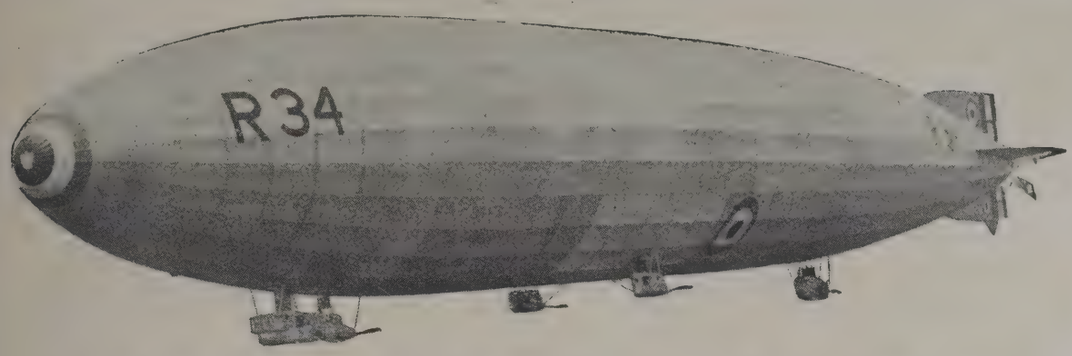
Saturday, August 2nd, Sunday, August 3rd and Monday, August 4th.—Tenth London Aviation Meeting at Hendon.

Tuesday, August 5th.—Handley Page Social and Athletic Club's Sports. Starting at 12 midday at Cricklewood Lane.

Thursday, August 21st.—R.A.F. Annual Athletic Meeting at Stamford Bridge.

Sunday, August 24th to Sunday, August 31st.—The "Avenir's" Tour de France Aérien.

SEPTEMBER.



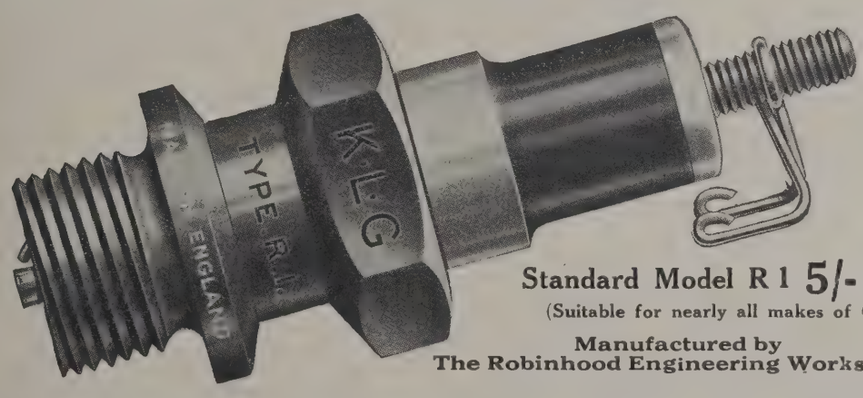
Wednesday, September 10th.—Schneider Cup Competition, Bournemouth.

DATES TO BE ANNOUNCED LATER.

Hendon—Birmingham—Manchester Air Race.

Hendon—Paris—Hendon Air Race.

Hendon—Brighton—Hendon Air Race.



ANOTHER GREAT TRIUMPH for K.L.G. Plugs

Fitted on the "Sunbeam-Coatalen" engines of the R.34 in her great Victory flight over the Atlantic, "K.L.G." Plugs gave every possible satisfaction and largely contributed to the success of the voyage out and home.

It is a noteworthy fact that "K.L.G." Plugs were used on all British Machines flying the Atlantic – first on the Sopwith (Hawker-Grieve) machine, then on the Vickers-Vimy (Alcock-Brown) Machine and on the British Airship R.34

All were available, "K.L.G." were chosen.

Standard Model R 1 5/- each
(Suitable for nearly all makes of Cars)
Manufactured by
The Robinhood Engineering Works, Ltd.

K.L.G. Plugs are the proved efficient Plugs for all makes and types of engines for Motor Cars, Motor Cycles, Commercial Vehicles, Aeroplanes and Airships.

MORE AIRCRAFT AT THE ACADEMY.

No. 286. "A British Aeroplane Being Pursued by German Machines after Photographing their Positions, August, 1917." Lent by the Imperial War Museum. Captain Louis Weirter. I deny the title as a fact, and I dispute it as a statement. Something will have to be done about this. I must be serious. It is no laughing matter. Well, yes, perhaps it is. I do not know anything about this picture, but I will say of it, as my Lord Macaulay said of Mr. Montgomery's poems, that it "exceeds all human compositions." Honestly I never saw anything like it. Nor, I will wager, did Captain Weirter. But he is a braver man than I. This is a large canvas, and every bit is covered with paint. By rolling over to an angle of 45 degrees a large something (assumed to be a British aeroplane) is got within the confines of the frame. "The light that never was on land or sea" is present. It casts what appears to be shadows on the lower wings of a lurid biplane. But there is some doubt as to this, as closer inspection reveals the fact that there appears to be a similar deposit of dirt at each wing tip. The estimated dimensions of the aeroplane (no wonder the pilot looks worried) are—span, 180 ft.; chord, 12 ft.; length of fuselage, 10 ft. Longitudinal stability is not marked, but very large empennage surfaces are fitted, and to simplify control the rudder is in one piece with the fin. Screw, 10 ft. diameter, revolving in what may be described as an extra geometrical figure. Aeroplane being severely Archied by shells which discharge large consignments of dirty cotton wool which has, one supposes, got through the leaky blockade. Bracing, 1½ in. steel rods. And it is wanted, too. Several shells have transfixed the planes; the fabric has erupted, and its ragged edges are *sticking up*. There's verisimilitude for you! There's proof conclusive that there is a vacuum on the top of the planes! Section of the latter appears to be very nearly truly semicircular. The machine has no landing gear. This, in common with similar fittings on all the other planes in this picture, has been shot away. A feature of the design is that the right lower wing has an overhang of about 25 ft. Left ditto has none. This is considered to be very good for coasting round mountains. The pilot has crushed himself close up against an engine which is in imminent danger of melting and running out of the fuselage!

IS IT A GERMAN TOAST RACK?

He may well try to efface himself, for what is this villainous object that presses on his heels? A German toast rack? Perish the thought! It is a super-Albafokkerstadtschafen driven by—heavens, not our stolen Rolls-Royce! No! It is driven by a pulmonary rotoscope! Realising his awful position, the British pilot urges his machine forward! In order to save weight he hurls his perspective overboard, and attaches his tail plane to the trailing edge of his upper wing. Alas, too late! The Boche has also jettisoned his perspective, which falls with a horrible crash on an uprising consignment of cotton waste. By this manœuvre he gains tremendously! He is enabled to cock his engine up at a sharp angle, and by very clever work he fires his fixed gun sideways through his screw. Has he hit? No, no, no! British pilot tucks his tail even closer in, and sits on the magneto! All will yet be well! The attacking machines are all aerodynamically inefficient. The nearest one has a span about 15 times the gap and the strain is beginning to tell on it. The German pilot has already discarded his tail. But nothing can avail him! Another two inches and he will have to swerve to avoid a solid lump of compressed Manchester goods. England wins! Floreat Etona! God save Ireland!

But what of the other side of the picture? Gawd knows. But I warrant it isn't half as amusing as the front.

No. 326. "Ronald Morgan, 2nd Lieut., South Wales Borderers, 55th Squadron R.F.C." Solomon J. Solomon, R.A. A fine portrait and a good impression of an aeroplane on the ground. This machine would fly after the riggers had put in new struts and a yard or two of bracing wire.

No. 325. "The German Fleet after Surrender, Firth of Forth, November 21st, 1918." James Paterson. No you don't, James! You have put in a nice solid Blimp, envelope encloses a lump of cast lead, but your aeroplanes won't pass. "They shall not pass." Why not read THE AEROPLANE? You would then realise that machines designed in about 1893 are no longer regarded as serviceable.

No. 324. "British Tank Attacking German Strong Point." Lieut. F. Leist. Two enormous (unrecognisable) aeroplanes securely secured to the sky. I would attack them, but they are not the artist's strong point. Leist said, soonest mended. They need mending.

A BASSETT-LOWKE BADLY GAMAGED.

No. 353. "Cavalry of the Air." W. B. Wollen. Inscription: "Our low-flying machines attacked enemy troops and transport. . . ."—*Official Dispatch.* Our low-flying machines missed the Huns in the picture by, according to my estimate, one mile. Our low-flying machines are not full-sized aeroplanes. They are models. I presume them to be Bassett-Lowke Fighters—one of them badly Gamaged. They are neatly fixed in the air by invisible rafwires. Nothing doing, Mr. Wollen. I refrain from the pun. But the Boche would never be worsted by your planes.

No. 364. "Help from U.S. Destroyer." Bernard F. Gribble. Positively a genuine oleomargarineograph. Colour as per Christmas supplement. Turgid, muddy, house-decorator colouring. And no wonder the machine came down in the sea. Look at the bracing, man!

No. 388. "Mobile Veterinary Dressing Station near Bullecourt." Algernon Talmage. Dear old long-faces! In background two very untidy kite balloons, calculated to drive any spinster frenzied. They do so want mothering. And the smallest aeroplane in the whole of the R.A. The dinkiest, weeest little thing. You could wear it on your watch-chain. The only drawback to its picturesqueness is that it stands out about a foot in front of the sky!

No. 756. "H.M.A. R.34." W. Russell Flint. JOLLY GOOD! A real painting by a real artist, who has got a pair of real eyes. If the Royal Aero Club wants something good, here it is. As R. L. S., the only R. L. S., says in "Treasure Island," p. 115:

"Ah!" cried another voice, that of the youngest hand on board, and evidently full of admiration, "he was the flower of the flock, was Flint!"

And he is!

There are several other pictures with aeroplanes in them. No. 733 (Charles Dixon), usual seascape; No. 621 (W. L. Wyllie, R.A.), all the "guts" taken out of the machine, and the details carefully shirked, etc.

But, after seeing No. 756, I got bored stiff with them and packed up.—W. G. ASTON.

THE GUNNER OFFICER'S OUTLOOK.

People who have served in the Air Force may or may not have a working knowledge of the point of view of the people who went through the war on the ground. Those who pertain to the people in the Air Force, such as admiring relatives or interested friends, would do well to acquire a knowledge of the kind of thing that the Air Force has escaped. Hence one recommends both to Air Force people and their belongings a small book called "Plain Impressions," written by one A. S. G. Butler, some time Lieutenant, Royal Field Artillery.

Mr. Butler's book consists of twelve short sketches of the work of an artillery officer, in turn as Forward Observation Officer and as Brigade Staff Officer. These sketches were written at odd times in 1915, 1916, and 1917, and six of them were published in periodicals. They are utterly different in their treatment from the work of the ordinary professional war writer.

Here, for example, is the first paragraph of the book describing existence in an observation post:—

> "5.15 a.m.—I am in a trench with two signallers. It is not in the front line, but a little behind it, and naturally in view of the enemy. There are two dug-outs: one for the signallers from which we observe, and the other for myself. They are about 4½ feet high, and quite dark, except for the doors and the hole to look through. We have been here since yesterday evening. It is not quite light yet. My feet are cold in spite of two socks, a puttee, a thigh boot, and five sandbags on each; but a coat and two blankets have kept the rest of me warm. I am lying on a duckboard with sacks on it about a foot below the roof. Have slept a little like you do in a railway carriage."

Mr. Butler's description of "Shell Shock" in the fifth sketch and his description of "Being Killed" (as he actually was, for a period) in the twelfth are something quite out of the ordinary, and in their grim simplicity remind one of Ambrose Bierce's stories of the American Civil War.

The curious contrast between moods is shown in the final paragraph of a very convincing description of an artillery barrage as seen from behind the guns, and not at the barrage end of them. The barrage apparently had been exceedingly successful. Here is how the mood changes:—

> "It was very soon over. The enemy retaliation was weak; so, after tidying up and mounting guard for the night, we went in to dinner. I enjoyed it after my ride to the waggon-line, and the new port was quite good. Then the letters were brought in, including my yesterday's paper. We looked at the news for a bit, and discussed the murder case that is making rather a stir in London at present. We thought on the whole it was rather a brutal one."

For all our talk about a League of Nations, other wars are still to come, and, for the matter of that, other wars are still going on, though only as a species of side show after what the unthinking journalist is pleased to call "Armageddon." Therefore it is well to read what is really in the minds of the men who do the fighting while they are fighting.

"Plain Impressions" can be had from The Aeroplane and General Publishing Company, Ltd., 61, Carey Street, W.C.2, price 2s. 9d. post free, and one believes that readers of the book will thank one for introducing them to it.

To "Aeroplane" Subscribers.

Since the Armistice, the subscription list of the AEROPLANE has steadily increased: an eminently satisfactory development which we are anxious to encourage.

Of the many books published on the war on the Western front, none conveys a more realistic impression of the work of a particular arm than FLYING COLOURS by Captain H. M. S. Saundby, A.F.C., R.A.F., M.C., published at **£2 2s.** net (Edition de luxe) and **15/-** net (Popular Edition).

Among the art books published in the last year or two, none can claim to be a more faithful reproduction of the artist's colour scheme and that indefinable thing atmosphere.

FLYING COLOURS is a permanent memorial of the life of "the pilot in action," as Major-General C. B. Ashmore calls him. It was very costly to produce, and necessarily the price to the public had to be high.

Many would like to possess it who do not feel disposed to put down Two Guineas for the larger edition or Fifteen Shillings for the smaller.

How to meet their views? We make a special offer to any subscriber for one year to the AEROPLANE: namely to give him the right to purchase either edition at half price.

All he need do is to send us the accompanying order form with cheque for one year's subscription, plus **£1 1s.** or **7s. 6d.** according to the Edition he wishes to have.

In order to be fair to current yearly subscribers we extend the half-price concession to them also. If a subscriber has paid a quarterly or half-yearly subscription, then to secure the right to participate he should send the balance for the year.

Subscribers who have given their orders through the trade, and not direct to the AEROPLANE Office, must sign the form below or a copy thereof, and hand it with the balance on account of the book to their retailer for transmission to the AEROPLANE.

If the subscriber already has a copy of FLYING COLOURS, and would wish to take advantage of this offer, then he may secure McCudden's "Five Years in the R.F.C." **(7s. 6d.)**; Richthofen's "Red Air Fighter" **(3s. 6d.)**, and Gill's "The Aerial Arm" **(6s. 6d.)** at half price, *i.e.* **8s. 9d.** the three, plus the year's subscription to the AEROPLANE.

ORDER FORM.

To THE "AEROPLANE,"
61, Carey Street, W.C.2.

Please send me the "AEROPLANE" for one year post free **(30/- inland; 35/- abroad)** and one copy of the { Edition de luxe / Popular Edition } of FLYING COLOURS at half price { **£1 1s. 0d.** / **7s. 6d.** } for which I enclose remittance value **£ s. d.**

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

Below will be found a first instalment of a series of articles written for THE AEROPLANE by M. L. P. Frantzen and dealing with the work which has been done in France in developing parachutes for use from aeroplanes.

M. Frantzen is well known in France as an authority on this particular subject, and is in a position to give an accurate account of what has been and is being done in that country.

Machines designed and built by Boulton and Paul, Ltd., of Norwich, are described in this week's issue in the series of articles on "Modern British Aeroplanes." Amongst them the twin-engined "Bourges" bomber deserves particular attention on account of the excellent performance and high manœuvring qualities which it possesses.

Mr. T. S. Harvey continues his account of the Taliedo Aero Show in this number.

AERIAL SAFETY AND THE AEROPLANE PARACHUTE.

Written Specially for "THE AEROPLANE" by L. P. FRANTZEN.

The safety of an aeroplane at this present time depends essentially upon the skill and the prudence of its pilot, beyond all question; but for the complete success of Civil Aerial Transport it is necessary to protect both pilots and passengers, one might almost say, quite independently of their own wills.

Aerial travellers, particularly business men and merchants, demand not merely relative but almost absolute safety. Let us therefore begin by giving them each their own parachutes whilst waiting for such time as the aeroplane has itself developed the life-saving qualities of the parachute.

The distrust of the public is due to its attaching vital importance to accidents. The facts—vividly revealed by brutal statistics of aviation accidents—confirm this view.

All aviation experiences leads to the conclusion that accidents throw serious discredit upon every aerial enterprise. Let us therefore impartially admit the facts and draw the logical conclusions thereupon.

An English aeronautical paper states that many people, although themselves believers in the utility of parachutes, would hesitate to throw themselves out of any aerial vessel. To this one would reply that:—

(1) It is essential that one should know how to use the parachute, and

(2) In any aircraft in danger the instinct of self-preservation is such as would prevent anyone from hesitating to use a parachute when one understood its method of use.

That this is the case is shown by the experiences of kite balloon crews during the war, and civilian aerial passengers will not be faced with the doubled risk of machine-gun fire during their descent.

Aeroplane pilots are not as indifferent to the value of parachutes as one might believe, but they are keenly aware that to throw oneself from an aeroplane making 200 kms. per hour is a hurried performance representing a rather more complex problem than that of leaving by parachute a balloon, whether captive, free, or dirigible.

To cast oneself, attached to a parachute, from a kite balloon—which may be considered as a fixed point in space—or even from a free or a dirigible balloon, where there is small risk either of entanglement or of upset caused by the speed of the balloon, has been an almost daily occurrence during the war.

With an aeroplane parachute it is a quite other matter, and that is why aeroplane pilots, knowing the difficulties, will not rely upon parachutes until such time as the parachute complies with all those conditions essential to safety which the author has already laid down. (See "L'Aerophile," March, 1919.)

One may divide into three classes the types of parachute which have so far been tried for use from high-speed aeroplanes:—

(1) Parachutes carried upon the back of the aviator, so that he has merely to leap overboard and then operate a releasing gear which allows the parachute to emerge.

(2) Parachutes which are carried on the machine at some suitable spot and are attached to the aviator's harness by a rope.

(3) Parachute systems in which the aviator is thrown out of the machine by some form of special mechanism.

The French "Conade" system of pre-war days was of this last type, and similar systems have been worked upon in the United States.

The first system is that which the Germans used on all their fast fighting machines during the last few months of the war.

The British "Calthrop" parachute is of the second type.

In France it is the "Robert" type of parachute which has been found most satisfactory.

The idea of using the ordinary Juchmès parachute, as used from balloons, for aeroplane work was considered, but was rejected because it was recognised that the conditions were totally different.

The French Section Technique de l'Aéronautique are engaged upon the design of a special parachute of which they have great hopes, and at some time soon France will have the pleasure of seeing the first official application of a parachute to the aeroplane.

It is well to recall here the pre-war parachute systems which gave promising results. These were the Robert, Hervieu, Jean Ors, Bonnet, Cayat de Castella, Od Kolek, Lommatsch-Kotelnikoff, and Blériot. Alone amongst these many inventors MM. Robert and Jean Ors have continued their efforts to perfect their systems and have produced types of parachutes of rational design. A résumé of the results obtained by Robert parachutes since 1912 will first be given:—

TEST OF ROBERT PARACHUTES.

First Type (1912-14).—Automatic release and certainty of inflation secured by elastic projecting arrangements

Dec. 23rd, 1912.—From the first platform of the Eiffel Tower.

1st Test: Dropped with sandbag of 45 kgs

2nd Test: Dropped with sandbag of 90 kgs.

Tests both satisfactory.

Sept. 21st, 1913.—M. Emil Brodin threw himself from the top of the transporter bridge at Nantes (60 metres). The parachute was released by M. Brodin half-way down in view of ultimate tests by dropping from an aeroplane. Test very successful.

June 10th, 1914.—Concours de la Securité en Aéroplane, at Buc. M. Champel released an 80 kgs. sandbag from less than 50 metres height, with satisfactory results. Awarded a prize of 2,000 francs.

Second Type (1916-1919).—Greatly reduced stowage, automatic release, steerability. Surface variable at will, allowing more or less rapid descent. Shock absorbers. Rapid and certain unfolding.

(4) At Villacoublay. Sapper Lallemand descended from an R.4, piloted by Adjudant Dussot, at a height of 600 m., and made a normal landing.

(5) May 5th, 1918.—At Pulham (Norfolk), under the control of Major Mostyn, this type of parachute was launched from 35 metres under the roof of an airship shed, opened in 15 metres and landed normally.

(6) Sept. and Oct., 1918.—American Aviation Camp at Orly (Seine et Oise). Series of successful tests under the super-

A Robert Parachute after landing.

vision of Lieut. Starcq, of the American Technical Aviation Service. Results: Orders for the manufacture of 1,000 parachutes. Owing to the Armistice only a few were actually delivered and the order was cancelled. A new order has, however, recently been given.

Official Explanation of the Death of Roger Lallemand, July, 1917.

Upon the representations of the French military aviation authorities that the Robert parachute carried on the aviator's back might inconvenience him in certain manœuvres, it was decided to place it in a drum placed in the fuselage below the aviator

This drum was provided with an automatic release operated by the pull on the cord attached to the aviator when he fell.

Twelve preliminary tests with sandbags were made successfully with this arrangement.

Corpl. Lallemand then undertook to descend with this arrangement.

Preparing to leave the aeroplane, he held the suspension cord in his right hand, with his left hand upon the side of the body, and jumped out sideways and backwards, without letting go the suspension cord, thus prematurely pulling out the parachute, and falling into it.

It was concluded therefore that, instead of letting himself fall like a sandbag, as was intended, Lallemand, instead of being in the proper position below the parachute at the end of the suspension rope, was actually above and wrapped up in the parachute like "a stone in a pocket-handkerchief." This has been confirmed by the Adjudant Pilot Dussot and other eye-witnesses.

This last unfortunate adventure of Robert Lallemand with the Robert parachute in no way reduces the value of the system.

Since this accident the inventor has taken steps to prevent the effect of such imprudences on the part of the parachutist.

The accompanying illustration of a Robert parachute landing shows this parachute at the moment the parachutist is releasing himself from his harness.

The shock absorbers E can be seen plainly. These produce two effects. At launching they reduce the stresses on the pilot's back caused by suddenly opening of the parachute, and on landing they similarly absorb the effects of wind gusts and prevent the parachutist being dragged over the ground whilst he is releasing his harness.

(To be continued.)

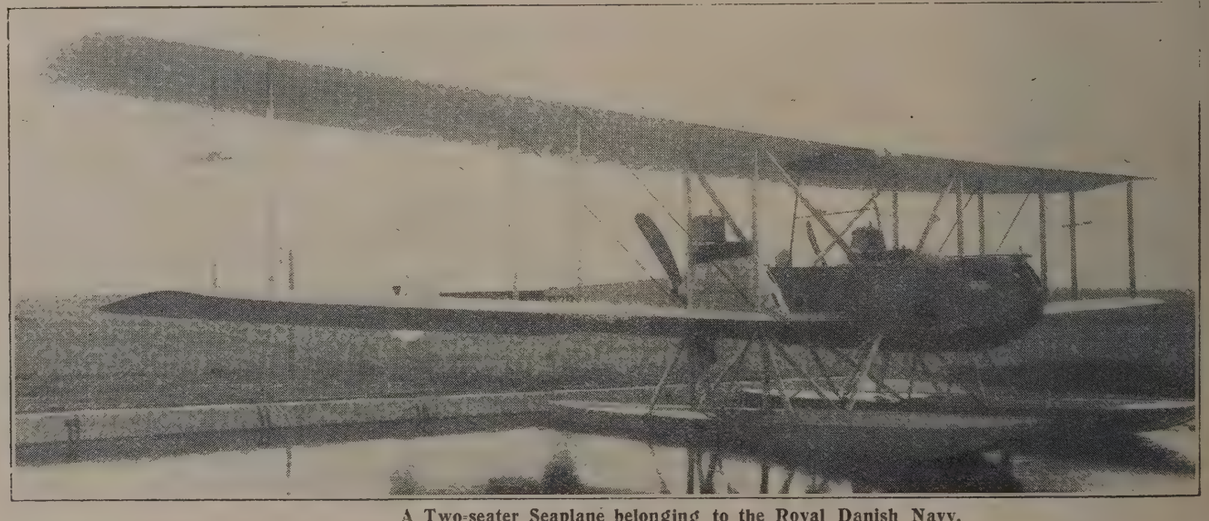
PARACHUTES.

The following letter has been received:—

In a recent most interesting article describing the "Autochute," Lieut.-Col. H. S. Holt, the writer, most pertinently draws attention to the fact that for a parachute to be of substantial service in saving life from aeroplanes it is essential that the apparatus should not be liable to entanglement with the machines, nor should there be any risk of the man falling inside the parachute in the event of an inverted opening caused by the machine falling faster than the man.

Parachutes that require extension of the silk body and rigging (some 40 ft. or 50 ft.) before becoming detached from the aeroplane may be successfully used for exhibition drops or to escape from a burning machine, although even with the aeroplane flying level it is not an uncommon occurrence for the silk body of such parachutes to be torn by the tail of the machine.

But with an aeroplane out of control, additional to the danger of the silk body being sucked into the tail, or of the man falling onto the parachute, there is, in the case of a spinning dive, the risk of the silk body being wrapped round the machine.

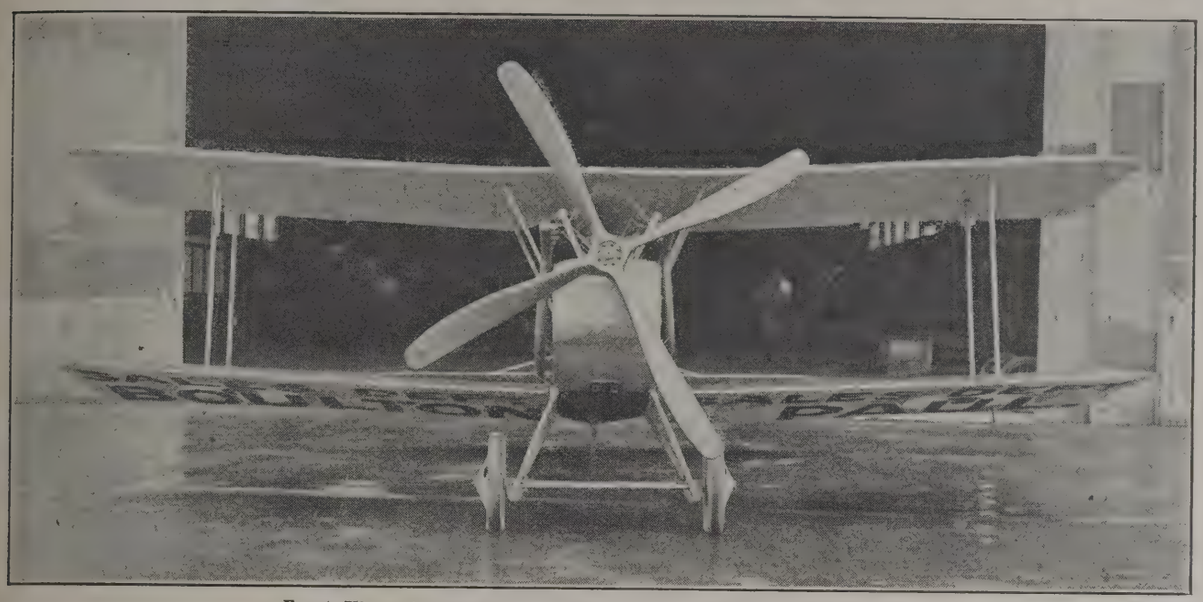


Lieut.-Col. Holt, however, is not correct in his premise that these disadvantages are inherent to all types of single, or simple, parachutes. The "Salvus" Parachute, which we are now manufacturing, is so constructed that at the first tightening of the sling the parachute entirely leaves its case as a compact mass of silk, and only when it is completely detached and several feet away from the aeroplane does the inflation of the silk body begin.

The opening of the parachute is rendered absolutely certain by the mouth of the silk body being held open to a definite area, until its whole length is partially inflated.

When the pull of the "filled out" silk body reaches a pre-determined amount, the lines are extended, and by a simple patented device the initial swing (hitherto experienced with parachutes when launched from aeroplanes) is practically eliminated, and important and carefully made tests have proved the shock of opening to be very slight, so that the weight, complication and expense of special "spring" slings is unnecessary.

One feature which we are sure Lieut.-Col. Holt will appreciate is that the opening of the "Salvus" Parachute is always normal to its line of motion through the air after complete detachment, so that in the case of a machine falling faster than the man, although the detachment from the aeroplane will be upwards relative to the machine, the inflation and subsequent complete opening will be actually downwards, rendering it impossible for the man to fall into the parachute; another point is that the whole apparatus is so simple that without any special gear it can be packed in less than half an hour by any person of average intelligence.



C. G. Spencer and Sons, Ltd.

A Two-seater Seaplane belonging to the Royal Danish Navy.

MODERN BRITISH AEROPLANES.

IX.—Boulton and Paul, Ltd., Norwich.

Front View of a Boulton and Paul "P.6" two-seater (100 h.p. R.A.F. Engine).

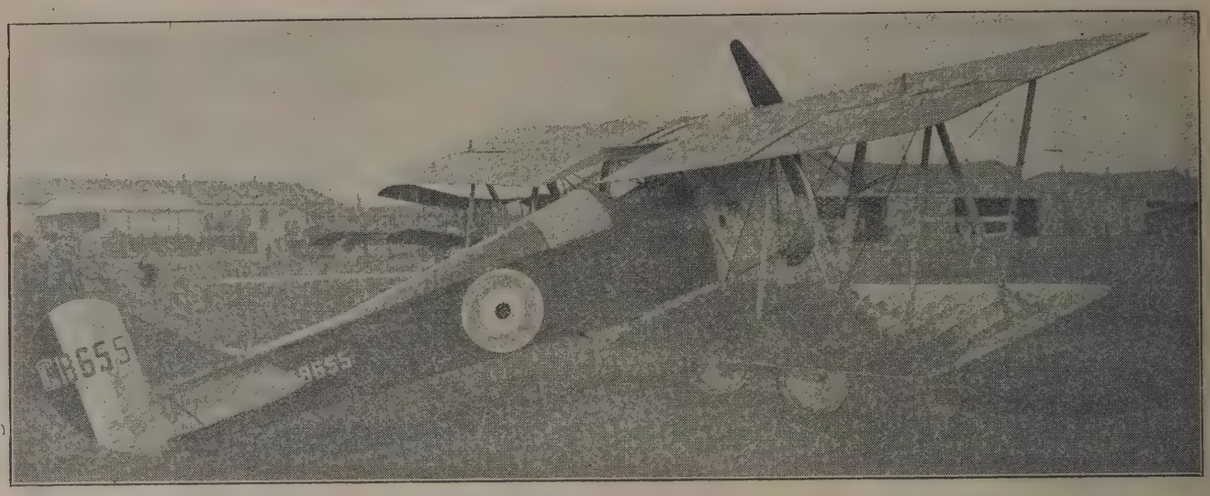
Boulton and Paul, Ltd., are a well-known firm of structural engineers, who took up the manufacture of aircraft during the war and who propose to continue that activity in the future.

They acquired a reputation for excellent work, and were encouraged by their success to undertake experimental design work which has led to the production of the machines hereafter illustrated and described.

Their experimental and design department is in the charge of Mr. J. D. North, whose experience of aircraft design dates back to very early times.

THE BOULTON & PAUL P.6 and P.9.

These two machines are generally very similar, although there are appreciable differences in the overall dimensions.



Both are simple and robust two-seater machines fitted with the 100 h.p. R.A.F. engines, and are suitable for training and touring purposes. The staff of Boulton and Paul, Ltd., have used this type of machine for the purposes of their own business and have found them distinctly useful.

"P.6."—SPECIFICATION.

Type of machine	Tractor biplane
Name or type No. of machine	P 6
Purpose for which intended	Air travel
Span	25 ft.
Gap, maximum and minimum	5 ft.
Overall length	19 ft.
Maximum height	8 ft.
Chord	5 ft.

Three-quarter Rear View of a Boulton and Paul "P.6." As may be seen by the legend upon the fuselage this machine is used for business purposes by Messrs. Boulton and Paul.

Three-quarter Rear View of the Boulton and Paul "Bobolink" (230 h.p. B.R.2 engine).

Total surface of wings	235 sq. ft.
Span of tail	11 ft.
Total area of tail	40 sq. ft.
Area of rudder	9 sq. ft.
Area of fin	2.5 sq. ft.
Area of ailerons	7.5 sq. ft.
Maximum cross section of body	7.8 sq. ft.
Horizontal area of body	27 sq. ft.
Vertical area of body	44 sq. ft.
Engine type and h.p	100 h.p. R.A.F.
Airscrew	9 ft. 3 in. Diam.; 1,000 r.p.m.
Weight of machine empty	1,100 lbs.
Load per sq. ft.	7.35 lbs.
Weight per h.p.	17.25 lbs.
Tank capacity in hours	2.37 hours
Tank capacity in gallons	20.1 gals.
Performance :—	
Speed at 1,000 feet	103 m.p.h.
Landing speed	45 m.p.h.
Climb—	
To 5,000 feet in minutes	9 mins.
Disposable load apart from fuel	400 lbs.
Total weight of machine loaded	1,725 lbs.

THE BOULTON & PAUL "P 9."

SPECIFICATION.

Type of machine	Tractor biplane
Name or type No. of machine	P 9
Purpose for which intended	Air travel
Span	27 ft. 6 in.
Gap, maximum and minimum	5 ft. 6in.
Overall length	25 ft.
Maximum height	10 ft.
Chord	5 ft. 6 in.
Total surface of wings	285 sq. ft.
Span of tail	12 ft.
Total area of tail	40 sq. ft.
Area of rudder	9 sq. ft.
Area of fin	2.8 sq. ft.
Area of ailerons	9.45 sq. ft.
Maximum cross section of body	7.8 sq. ft.
Horizontal area of body	37 sq. ft.
Vertical area of body	56 sq. ft.
Engine type and h.p.	100 h.p. R.A.F.
Airscrew	9 ft. 3 in. Diam.; 1,000 r.p.m.
Weight of machine empty	1,244 lbs.
Load per sq. ft.	6.3 lbs.
Weight per h.p.	17.7 lbs.
Tank capacity in hours	3 hours
Tank capacity in gallons	24 gals.
Performance :—	
Speed at 1,000 feet	104 m.p.h.
Landing speed	42 m.p.h.
Climb—	
To 5,000 feet in minutes	8½ mins.
Disposable load apart from fuel	400 lbs.
Total weight of machine loaded	1,770 lbs.

THE BOULTON & PAUL "BOBOLINK."

A small, high-performance single-seater, designed and built towards the end of the war. Like many other excellent machines of similar date, this was never manufactured in quantity.

The illustrations give a very good idea of the general features of the machine.

SPECIFICATION.

Type of machine	Single-seater biplane
Name or type No. of machine	Bobolink
Purpose for which intended	Fighting Scout
Span	29 ft.

Three-quarter Front View of the B. and P. "Bobolink."

The Boulton and Paul "Bourges" fitted with two 320 h.p. A.B.C. "Dragonfly" Engines.

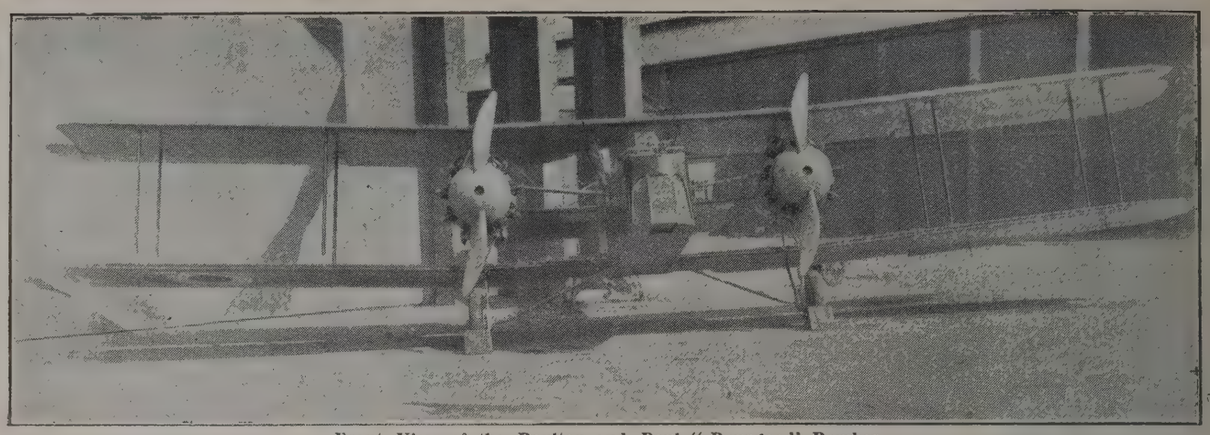
Gap, maximum and minimum	3 ft. 10⅝ in.
Overall length	20 ft.
Maximum height	8 ft. 4 in.
Chord	Top plane, 5 ft. 4½ in.; bottom plane, 4 ft. 1⅛ in.
Total surface of wings	266 sq. ft.
Span of tail	9 ft. 2 in.
Total area of tail	30 sq. ft.
Area of rudder	10 sq. ft.
Area of fin	2 sq. ft.
Area of ailerons	7.5 sq. ft.
Maximum cross section of body	7.5 sq. ft.
Horizontal area of body	30 sq. ft.
Vertical area of body	41 sq. ft.
Engine type and h.p.	230 h.p. B.R.2.
Airscrew, diameter and revs.	9 ft. 0 in. Diam.; 1,350 r.p.m.
Weight of machine empty	1,220 lbs.
Load per sq. ft.	7.25 lbs.
Weight per h.p.	8.35 lbs.
Tank capacity in hours	2.65 hours
Tank capacity in gallons	38 gals.
PERFORMANCE :—	
Speed at 10,000 feet	125 m.p.h.
Speed at 15,000 feet	110 m.p.h.
Landing speed	50 m.p.h.
Climb—	
To 10,000 feet in minutes	9½ mins.
To 15,000 feet in minutes	18 mins.
Disposable load apart from fuel	430 lbs.
Total weight of machine loaded	1,920 lbs.

THE BOULTON & PAUL "BOURGES."

One of the most successful of the twin-engine fighter bomber class yet produced. As twin-engine machines go, the "Bourges" is of quite small dimensions, and of very clean design.

As is more or less standard practice in this class, the accommodation provided is for a front gunner-observer in the nose of the central fuselage, with pilot's seat behind that but in front of the main planes, and a rear gunner's seat just aft of the upper rear spar.

The performance of the "Bourges" approaches that of the single-seater fighter class, and for a large machine the manœuvrability is extraordinary, and the machine can be looped and spun with ease.



Some early specimens of this type were fitted with the B.R.2 engine of 230 h.p., but in the later machines the A.B.C. "Dragonfly" is used.

SPECIFICATION.

Type of machine	Twin-engined biplane
Name or type No. of machine	Boulton & Paul P 7 "Bourges"
Purpose for which intended	Bomber-fighter
Span	54 ft.
Gap, maximum and minimum	6 ft. 6 in.
Overall length	37 ft.
Maximum height	12 ft.
Chord	Top plane, 8ft.; bottom plane, 6 ft. 6 in.
Total surface of wings	738 sq. ft.
Span of tail	16 ft.
Total area of tail	96 sq. ft.
Area of elevators	96 sq. ft.
Area of rudder	21 sq. ft.
Area of fin	14 sq. ft.
Area of ailerons	27 sq. ft.
Maximum cross section of body	5.3 sq. ft.
Horizontal area of body	73 sq. ft.
Vertical area of body	140 sq. ft.
Engine type and h.p.	2—320 h.p. A.B.C. "Dragonfly"
Airscrew, diameter and revs.	9 ft. 6 in. Diam.; 1,650 r.p.m.
Weight of machine empty	3,420 lbs.
Load per sq. ft.	8 lbs
Tank capacity in hours	9.25 hours
Tank capacity in gallons	190 gals.

Three-quarter Front View of the "Bourges" twin-engine Bomber (two 320 h.p. "Dragonfly").

Front View of the Boulton and Paul "Bourges" Bomber.

Performance :—	
Speed at 10,000 feet	124 m.p.h.
Speed at 15,000 feet	118 m.p.h.
Landing speed	50 m.p.h.
Climb—	
To 10,000 feet in minutes	11 mins.
To 15,000 feet in minutes	21 mins.
Disposable load apart from fuel	1,200 lbs.
Total weight of machine loaded	5,920 lbs.

THE BOULTON & PAUL COMMERCIAL TYPE.

Generally speaking, this machine is an enlarged edition of the "Bourges," fitted with engines of greater power and equipped for commercial and passenger-carrying purposes.

As may be seen by the specification, a very high performance is expected from this type. This is an important feature—not because Messrs. Boulton and Paul expect to run commercial services at 149 m.p.h. with this type of machine; but because with this machine it should be possible to run at 120 m.p.h. at, roughly, half full power, and to approach this speed with one engine only.

It should thus be possible to run really high-speed services without keeping engines continually all out, and to maintain schedule times even if one engine fails completely.

SPECIFICATION.

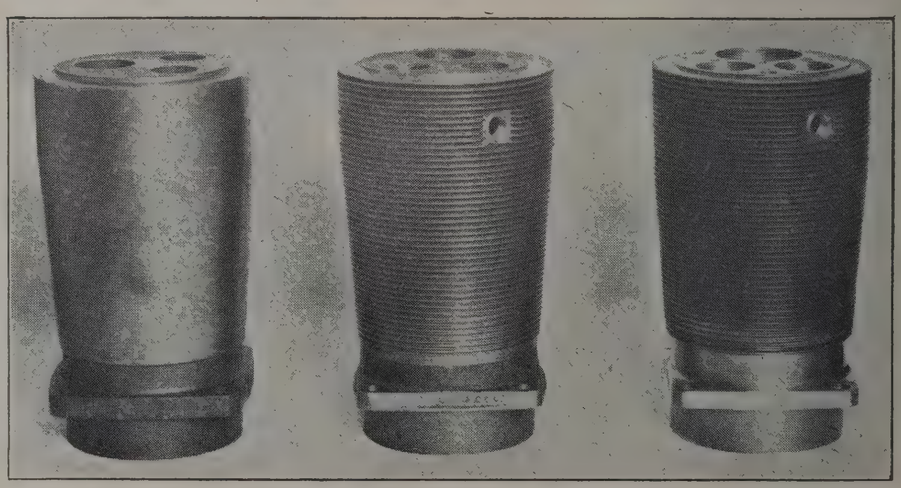
Type of machine	Twin-engined tractor biplane
Name or type No. of machine	Boulton & Paul P 8
Purpose for which intended	Passenger and commercial
Span	59 ft.
Gap, maximum and minimum	6 ft. 6 in.
Overall length	40 ft.
Maximum height	12 ft. 4 in.
Chord	Top plane, 8 ft.; bottom plane, 6 ft. 6 in.
Total surface of wings	770 sq. ft.
Span of tail	16 ft.
Total area of tail	96 sq. ft.
Area of elevators	96 sq. ft.
Area of rudder	21 sq. ft.
Area of fin	14 sq. ft.
Area of ailerons	27 sq. ft.
Maximum cross section of body	22 sq. ft.
Horizontal area of body	108 sq. ft.
Vertical area of body	180 sq. ft.
Engine type and h.p.	2—450 h.p. Napier "Lion"
Airscrew, diameter and revs.	9 ft. 6 in.; 1,450.
Weight of machine empty	4,000 lbs.
Load per sq. ft.	9.75 lbs.
Weight per h.p.	8.34 lbs.
Tank capacity in hours	4 hours
Tank capacity in gallons	210 gals.
Performance :—	
Speed at 10,000 feet	149 m.p.h.
Speed at 15,000 feet	142 m.p.h.
Landing speed	54 m.p.h.
Climb—	
To 10,000 feet in minutes	8 mins.
To 15,000 feet in minutes	15 mins.
Disposable load apart from fuel	2,000 lbs.
Total weight of machine loaded	7,500 lbs.

THE DEATH OF MR. A. VICKERS.

Mr. Albert Vickers, late Chairman of Vickers, Ltd., died on Saturday, July 12th, at Eastbourne, at the age of 80. It was owing to his far-sighted policy that his company was able to meet the immense demands which were put upon it by the war.

The Vickers' business was established by Mr. Vickers' forebears in the eighteenth century, and when he entered the works at the age of 16 it was a comparatively small steel-making concern.

He built up the business, his policy being to centralise the control of factories engaged on making the various parts of one complicated piece of machinery, until the capital reached over eight millions sterling.



Sir Hiram Maxim brought him his idea for a machine-gun in 1883, and it was Mr. Vickers' financial help and energy which enabled the gun to be planned, patented and made. This machine-gun was afterwards improved and known as the Vickers-Maxim.

In 1911 Vickers, Ltd., formed an aviation department under the late Major H. F. Wood, and the department has also been of very great value to the Nation during the war.

AUSTIN WORKMANSHIP.

The accompanying photograph, which was supplied by the Austin Motor Co., Ltd., shows three successive stages in the process of manufacture of a cylinder for an A.B.C. Dragonfly Engine. From left to right the stages are (1) Blank bored and rough turned outside and valve seatings bored out. (2) Fins machined up and sparking plug socket formed and screwed. (3) The complete cylinder with valve seatings and stud holes finished, and with the fins copper-plated.

The manufacture of cylinders of this type calls for the best of materials and workmanship, and the fact that the Austin Motor Co. carried out the whole process from forging the blank to the finished article shows that they are equipped for the highest class of work.

AMONG THE EXHIBITS AT TALIEDO AERO SHOW.

An S.V.A. Seaplane with Guidoni "Palette" Floats, to which reference is made below.

Following on the preliminary notes on the Aero Show at Milan, which was published last week, Mr. T. S. Harvey writes:

Ing. Caproni's Company stage one or more examples of every type of CA still in use, from the "Baby" mono. to the Liberty-engined 1,200 h.p. triplane, with the exception of the seaplane; that is to say, the "Baby," the 300, of '14, the 400, the 600, and the 900, as well as the Pullman-car triplane. The least known of the designer's progeny is the smaller single-engined trench-bombing triplane which was designed for the Fiat 700 h.p. motor and is sulking with a 300 radial engine. The speed was calculated at 220 kilometres, and the machine was to be a terrible scourge to Austrians, entrenched or otherwise.

Perhaps what is most striking in all the Caproni products is the constant progress in detail improvements. It is quite unusual to find two machines of the same type and identical construction in every way.

One will have, say, a new kind of mudguards, another an unexpected bit of streamlining, or something bettered about the landing gear or radiator fittings, which things point to the continuous study and experiment of a mind ever hunting progress.

E.g., onen oted the narrow dumpy body on the level of the lowest plane of the latest 900 triplanes, combining a bracing-up of the lower regions of the machine with a degree of side surface apparently desirable low down. The retractable steps into the Pullman give an impression of completeness not obtained by any amount of fine upholstering and recessed roof lighting. The triplane shown has no forward two-wheeled skid; sixteen wheels instead are to be counted in the central landing gear.

One was assured on next-to-highest authority that the 100 passenger hydro-triplane is well on its way to its first unsticking. The big barges needed for floating such a large thing are not being turned out by the CA works, contrary to the firm's custom. Messrs. Zari, I believe, make the triplane's floats, which are merely the size of your houseboats.

The Ansaldo Company's various types are all over the Show, being present in every section of the exhibition and in the air above it. In fact, they are almost unbecomingly omnipresent! The firm's Balilla, designed, as was not the S.V.A., by their own Ing. Brezzi, and differing from this latter most perceptibly by the absence of the open V struts, is shown, as several other small fast machines are shown, cocked high up in steep banking positions on two misfit posts. Interest naturally centres in the latest Ansaldo machine, up till now unseen and unheard of, at least by the general public. This is a 300 h.p. biplane with ear-shaped balancing areas to the ailerons protruding from the ends of the upper plane in an ugly if distinctive fashion. The streamlining of the double cables has been more carefully attended to than is usual here. The short stumpy four-leaf metal skid is fitted under the tail of this as of all the Ansaldo machines. Unfortunately only the Guidoni-cum-Forlanini-palette floats for the Ansaldo seaplane are exhibited. It is true that these are the machine's most striking feature, being metal cylinders pointed at both ends, the forward of which turns heavenwards, the latter —contrariwise. The four-leaf tail-skid mentioned above as standerd on Ansaldo and Sva machines seems to be responsible in a large degree for their unusually rapid pull-up, which makes them more suitable for passenger work than might be expected. The braking effect of the skid directly weights gets down to it is very noticeable—even to the ear!

The Ansaldo engine in its latest type, No. 4 E 284, is a 12 cylinder V of 60 degrees water-cooled.

The steel cylinders, separately detachable, have a bore of 140 mm. and stroke of 180 mm. The water-jackets are of pressed steel, and each cylinder has four valves. Two double Zenith carburetters, two magnetos, two water and two oil pumps are fitted.

The connecting-rods of the rank of cylinders on one side are specially strengthened to carry the rods from the pistons of the other, which are connected up to them directly. The cylinders are flanged and bolted to the aluminium crankcase, which is unusually long at the propeller end, forming a sump and allowing the propeller to be set well out and on an abnormally long bearing.

The power developed at normal revs., 1,650, is 520 h.p. By "reving" up to 1,800, 570 h.p. has been obtained. Weight per

The Fiat Co.'s (S.I.A.) B.R. Biplane (700 h.p. Fiat Engine).

normal h.p. works out at 0.98 kilograms. Oil consumption per h.p.-hour, 15 grams. Petrol ditto, 220 grams.

Also used by Macchi for seaplanes. The engine is built at S. Giorgio works at Turin

The Fiat Company's great attraction is naturally the BR, on the data from which machine the trans-oceanic space-annihilator is being built. In appearance the BR is not as handsome as it performs handsomely, but is, owing to its enormous single-engine-developed horse-power, in a class by itself. The machine has been loaded with nearly one and a half thousand kilograms instead of the nine hundred for which it is designed, without feeling the load abnormally.

The Fiat A.14 12-cylinder V gives 685 h.p. at 1,559 revs. per minute, and weighs 730 kilos. sans propeller shaft and exhaust piping. Four Dixi magnetoes are fitted and two Fiat carburetters.

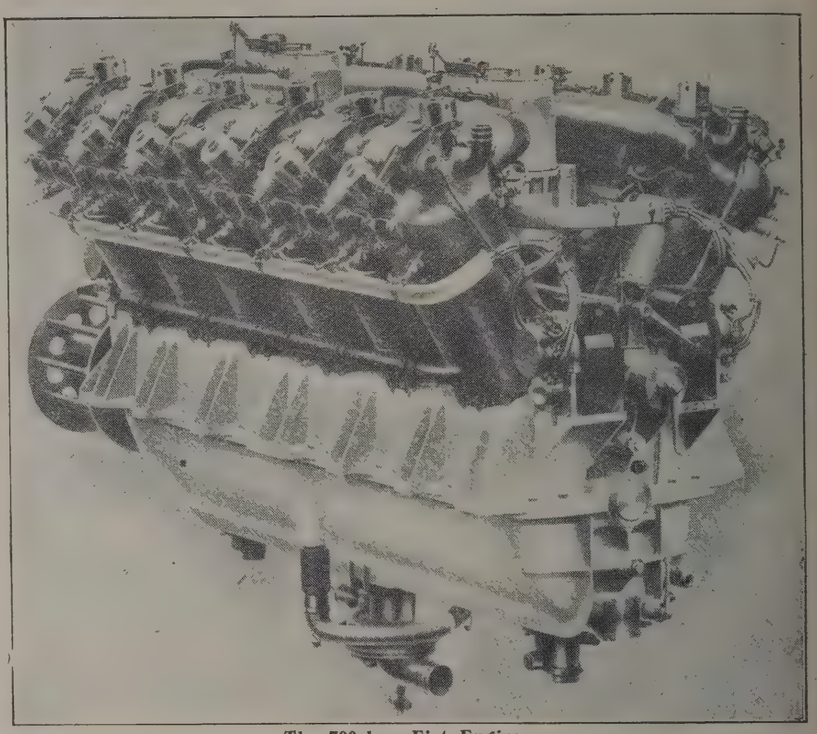
With normal load of 900 kilos. Brach-Papa has got 255 kilometres per hour out of BR, and 261½ with two passengers on a straight course, while the rate of climb is to 3,000 metres in 9 minutes, 4,000 metres in 16 minutes, and 5,000 metres in 25½ minutes.

In her successor metal bulkheads to ensure floating are formed in the central section of the fuselage, which carry reserve fuel supplies and are provided with ripping panels to ensure rapid release when their contents become unnecessary.

Messrs. Nieuport-Macchi present for public study various Nieuports and Hanriots, as well as their very efficient seaplanes, which did excellent work during the last four years in the Adriatic and elsewhere. Nos. M.7, M.8, M.9, M.14, and M.15 are staged, which makes the absence of M.12 even more noticed. The first three are oft-described developments of the earliest Macchi efforts.

M.9, however, is shown with a limousine body, the which covers a multitude of sins nowadays.

M.14 is a small single-seated chaser biplane of about 17 sq. metres surface, doing 188 per hour, with a Le Rhône 110 h.p. engine, and climbing to 5,000 metres in 21 minutes with useful load of 200 kilograms. It is armed with two Vickers guns, and the upper plane is nearly twice the size of the lower, with a very considerable stagger.



M.15 is a large biplane with Fiat 300 motor, with certain good points still being loudly called for when the Armistice upset war aims. The total surface is 42 sq. m., and the planes are directly super-imposed, the upper being nearly double as large as the lower one. Three mitrailleuses are carried which weigh, with ammunition therefor, 70 of the 500 kilos. of useful load.

Pilots are enthusiastic about the narrow flat-topped body giving plenty of standing and moving-about room for the observer and space for all his tackle, and observers like the nearness of the pilot. To all this one can add that the petrol tank is at the centre of gravity, and that both the rear-firing guns may be aimed parallelly to the line of flight of the machine, one being mounted in the floor of the fuselage, which tapers to a horizontal knife-edge at the tail

Apparently the less said of the absent M.12 the better.

The Press here, technical and non-so, are frankly disappointed in the section devoted to the Trophies of War.

This section gives a wonderfully poor idea of Italy's takings in the fight. One writes "wonderful" because one wonders if it is possibly an intentional affront perpetrated by some still unconvinced admirer of the Hun.

The 700 h.p. Fiat Engine.

Allowing for difficulty of transport and the strongly contested terrain in which the crashed enemy craft came to rest, one could reasonably expect to have found Italy's air forces glorified by a more numerous display of captured seaplanes, of which there must be a number intact. Not many more enemy planes are on view than at the 1917 show, and these, though more varied, are in less eyeable and therefore less educational condition.

Of these fragments the enormous K.G. 338 three-seater seaplane tops the exhibit. It is a single cellule construction of 100 sq. m. surface (in itself remarkable), and the struts to which are at a very open angle, and, as is the case with the wing tip floats, very well streamlined and, like them, calculated to add a very perceptible amount of lift to the craft.

In the boat-body is a 12 cyl. V. 350 h.p. A. Daimler, and the total weight is 1,990 kilos. Speed is given as 140 kilometres per hour, and climb to 1,000 in 14 minutes.

Capt. Banfield's hydro-chaser, with Hero 230 h.p., a single pair of interplane struts parallel to the line of flight, a speed of 176 kilometres the hour, climb to 1,000 in four minutes, and weight of 776 kilos, does not impress one exceedingly.

Brumowsky's scout, with Mero 160, is more interetsing, with great wing flexibility and much striving after weight-reduction. If my memory serves me worthily, these machines were highly thought of by fighting men on account of their good climbing and general manœuvring at extreme altitudes.

Facilities for examination of these and the other remains were inexplicably absent nearly a month after the Show was opened.

Among other departed, whose identity could only be guessed at, was a very mangled thing of enormous span, labelled "Gotha," which occupied the horizon line in the dim depths of the shed where the nine enemy trophy machines reposed.—T. S. H.

(To be continued)

INTERNATIONAL METEOROLOGICAL ARRANGEMENTS.

It is understood that the International Hydrographical Conference, which has been sitting under the presidency of Rear-Admiral Sir J. F. Parry for some weeks, has now concluded.

This Conference has been largely concerned with an effort to standardise the form in which meteorological information is supplied to mariners.

The adoption of a uniform system of units has been discussed, and it is understood that the Conference will record a resolution in favour of the use of the metric system.

It is hoped that as a result of this Conference an International organisation for the dissemination and exchange of meteorological information may be established.

It is hoped that the use of aircraft will in the future provide much valuable meteorological data, and that the International Meteorological Bureau, when established, will reciprocate by supplying aircraft with more accurate and more useful weather forecasts than has been the case heretofore.

OLEAGINOUS COURTESY.

American officers deeply appreciated the courtesy shown by Britain in connection with the trans-Atlantic voyage of the R.34. They said that England had given them all information, and even samples of the oil for engine bearings, which they wanted to analyse for their own purposes.

The oil referred to was Wakefield's Castrol R., which was used on the voyage of the R.34 and on the historic flights of Sir John Alcock and Mr. Hawker.

COMMERCIAL AERONAUTICS & CIVIL AERIAL TRANSPORT

"FINE AND WARMER?"

By "MEDWAY."

A week or so ago I took up my morning copy of the "Times" and read, at the head of the column to which I always refer first, the ominous words, "There is a depression over the wash."

Personally, I have been suffering from this depression for the last two or three years. It has been growing more and more severe with every fluctuation of the labour market, and I fear that, when Germany and America have time to import their latest shirt-destroying and collar-lacerating machinery, the thing will reach an acute stage.

I am, however, digressing. What I took at first to be a statement of a mere platitude, well known to every possessor of a dress shirt, I found to be an intimation of an absolutely new state of affairs. The wash referred to was the one in which some early king—I forget who—lost his luggage. The depression was atmospheric and not mental.

The Depression That Failed.

A further statement announced that the depression in question was growing in intensity and was on its way to London. The column was therefore headed, "Rain or Showers. Colder." In point of fact, that particular day was one of the hottest and most oppressive experienced this year. Not a cloud was to be seen, and the English climate did not even turn on its common stunt of producing rain from a chunk of sky containing no clouds whatever.

That morning, no doubt, the weather experts faced the elements with mackintoshes and umbrellas, contemptuously sorry for the mere man who took things as he found them and neglected any particular precautions.

I am not certain, however, that I am right about this. I question whether the expert meteorologist does not still tend to trust his eyes rather than his logical faculties when he comes to consider the weather from a purely personal standpoint. On some occasions he is more or less bound to do so. For instance, the other day, when the forecast summed itself up as "fine and warm," it rained steadily from six in the morning till eight at night.

Before the war the weather expert merely posed as a prophet, but did not attempt to explain on what he based his prophecies. He generally served up his views in the guise of a lady in Grecian drapery being blown to bits, struggling with an umbrella or garbed in a sunny smile. You could take her advice if you liked.

The Realisation of Ignorance.

Now we are told that the experts know a great deal more about the weather than they did five years back. My own idea is that they have reached that stage in learning at which the student realises he knows nothing. If so, they have certainly made an advance. Having reached this stage, they prefer not to prophesy blindly, but to draw a pretty map crossed by a lot of curly lines with figures at the ends. They argue round this map until they have convinced themselves and their audience that it is quite likely that the weather may do what is expected of it. They generally contrive to give you a forecast which is a fairly accurate description of what it was like yesterday. This is all right so long as the weather is settled, but it is not infallible in a climate like ours.

Thus, I notice in to-day's paper that "the optimistic view that was taken of the meteorological situation yesterday proved within a very short time to be ill-founded." There is something confiding about this sort of statement. It is as though the expert said to the reader, "You and I were quite wrong after all."

I am sometimes inclined to go back to the old device which G. P. Huntley ascribed to a "bwainy" friend of his. "You take a piece of board—about so long—and you put the end of it out of the window, then you close the window down on it. Half an hour later you go back and take in the board, and if it is wet you know it has been waining." The device at least has the merit of simplicity.

The Weather and Commercial Aviation.

I am afraid that there is nothing particularly illuminating in these remarks. The majority of readers of THE AEROPLANE have had good reason to know on more that one occasion to what extent they could or could not trust the weather expert. I should, however, like to suggest that any member of the outside public who thinks of going bald-headed into commercial aviation schemes should take a preliminary course of weather instruction from the "Times" or any other morning paper. He will find in the appropriate column quite a lot of good information, but if he follows the thing day by day he will also find that we are as yet very far from being able to forecast the weather even over our own country, much less in the middle of the Atlantic.

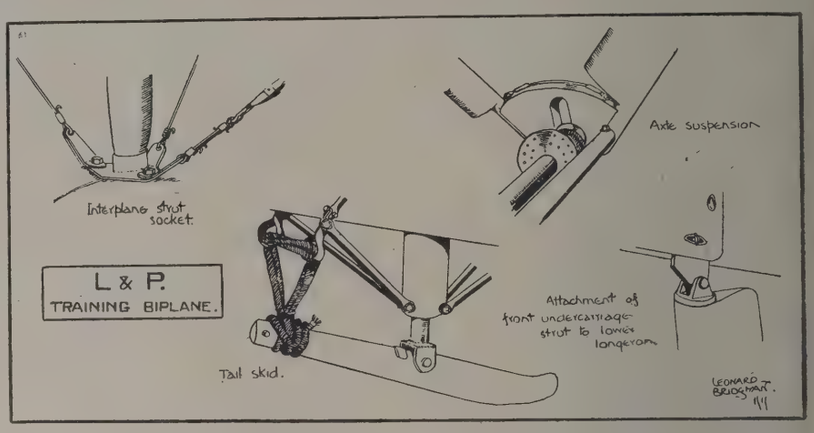
Let him, coupled with this, recognise the fact that a proper understanding of meteorology is almost the first essential to the untrammelled development of long-distance aerial services, and he will see the need for hastening slowly. I do not mean for a moment that things have got to stand still until we know all about the weather, but only that one must be very cautious of accepting vague generalities which would give us falsely to understand that we have already completely solved problems upon which the perfect solution of other problems in course of solution is at least to an extent dependent.

"SURPLUS."

The Director of Publicity, Ministry of Munitions, publishes under the above title and at the price of 3d. a fortnightly descriptive guide to the sales of surplus Government stores.

In many sections fairly comprehensive lists of surplus parts available, together with the fixed prices at which they are to be sold are given.

The publication deals with goods varying from complete rolling mills to articles of domestic furniture, from aerodromes complete to surgical implements, and may reveal a possible source of supply in the most unexpected place to anybody who needs anything.



"Surplus" is published on the 1st and 15th of each month, and can be obtained at all bookstalls.

A MACHINE AND TUITION FOR £400.

Most men who wanted to fly before the war, and who did not, owing to the instability of the machines or the cost, were able to avail themselves of the free instruction offered by the R.F.C. or the R.N.A.S. when the war got going; and nowadays, although many ex-pilots have little desire to "flip" any more, many still wish to continue; but not being able to obtain jobs as civilian pilots and not wishing to stay on in the R.A.F., they slide back into the groundwork of civil life.

It is unfortunate for the Schools of Flying that there are so many pilots on the market, for few people will want to learn to fly now, but in a few years when the present schoolboys have grown up there will be quite a rush, and with the progress of civil aviation many more pilots will be required than are wanted at the present time.

The L. and P. School of Flying was established at Hendon before the war, and built their school aeroplanes in their own workshops, giving the pupils an opportunity of gaining inside knowledge of the machine and engine they were to fly. In the first month one pupil was trained, in May, 1918, 54 pilots gained their certificates, and a total of 550 were trained during the war.

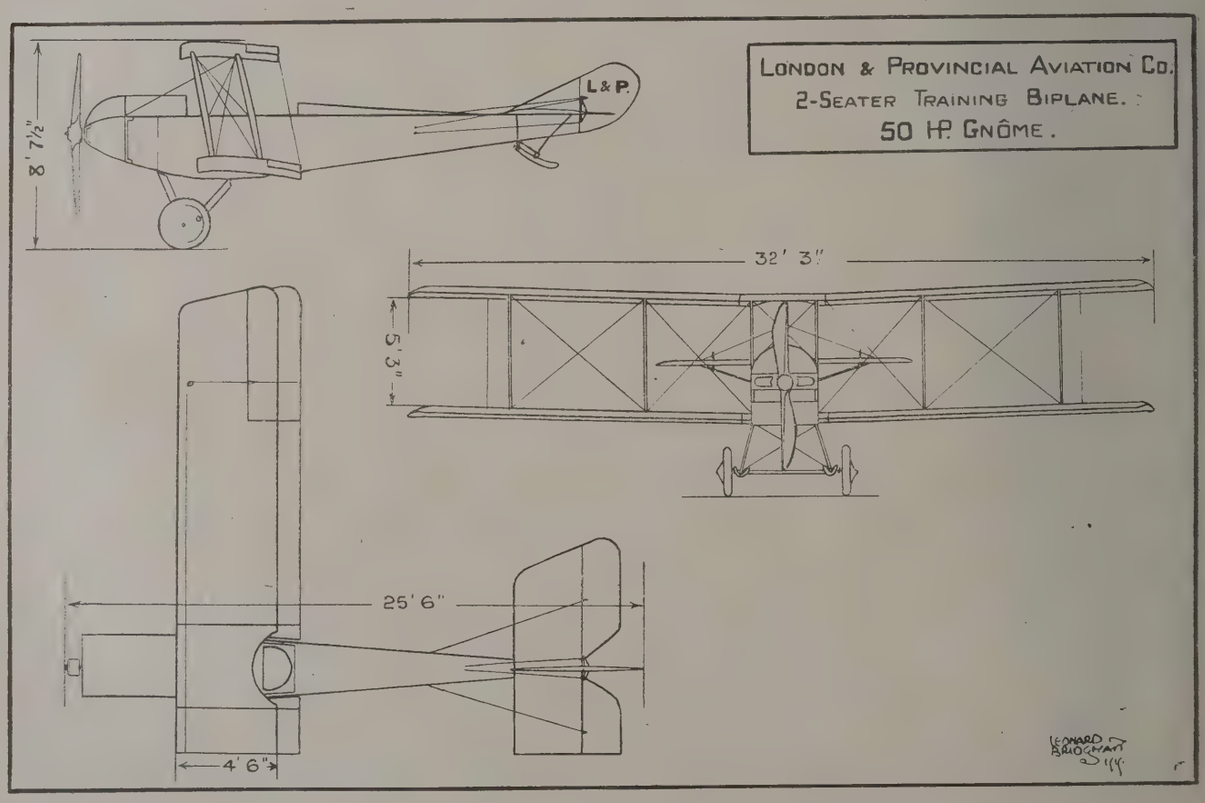
When the Government took over the Hendon aerodrome, a move was made to the present site at Stag Lane, just off the Edgware Road, past Hendon. It is a very good spot for an aerodrome, as there are no tall trees or other obstacles to interfere with landing. It is 120 acres in extent.

Previous to this year, flying was taught on Caudron machines fitted with 50 h.p. Gnôme engines, but now a new two-seater tractor biplane has been designed which can be looped, half-rolled and generally stunted.

This machine was designed primarily as a dual-control training machine, but machines of the same type constructed since then have been used quite a lot as passenger-carriers, and since last Easter they have made about 500 flights without so much as a piece of broken wood or bent metal work.

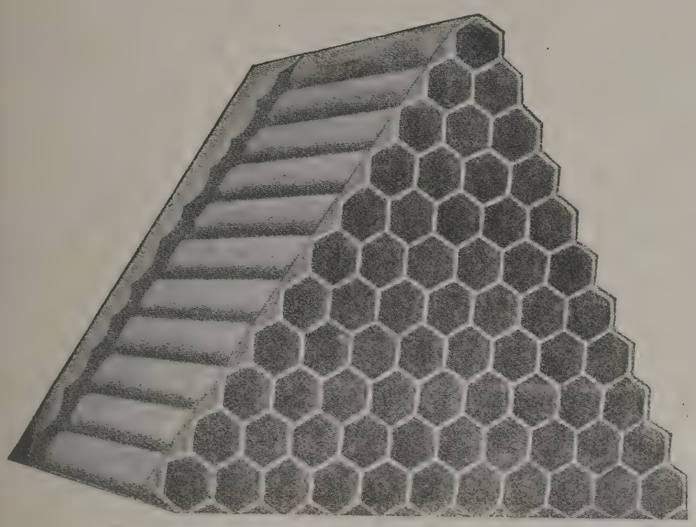
The whole construction of the machine is extremely sturdy and absurdly simple. As a solo machine it has climbed to 9,000 ft., and with two up it has reached 7,000 ft. It has a maximum speed of 65 m.p.h., with a landing speed of something like 30 m.p.h.

The general arrangement of the machine can be seen in the accompanying scale drawings, which also give the principal overall dimensions.



For £400 a pupil is taught to fly, and is then given one of these new machines to take home with him.

The engine is the 50 h.p. Gnôme, and though it cannot be called reliable and wants a mechanic to look after it who has specialised in that engine, and though it must be taken down after every 18 hours' flying, it is nevertheless capable of doing much good work.



If only a little four-cylinder stationary engine were fitted, the pilot, if he was a pretty fair mechanic, could look after it himself. If he had the rigging overhauled when necessary, here is the ideal little machine to keep on your back lawn to fly yourself and your friends for business or pleasure.

The Air Ministry refuse to license this machine with its 50 h.p. engine, except temporarily and under irksome restrictions, as they do not consider its power sufficient to carry two people successfully, shutting their eyes to its actual performance.

A machine is being built which is designed for an 80 h.p. engine.

SERVICE PEOPLE IN CIVIL AVIATION.

It is obviously desirable in every way that firms in the Aircraft Industry should fill up any vacancies which occur in their businesses with people from the Flying Services. In the first place those who have served the King during the war have a greater claim to any jobs that may be going than have those who have merely stayed at home and made money. And, secondly, people who have come straight out of the Air Force naturally know more about the needs of aviators than do the stay-at-homes.

Quite apart from any question of patriotism, or one's duty to people who have served in the war, it certainly does pay any firm to engage ex-R.A.F. people whenever possible, simply because they come out of the Service with the very latest practical knowledge of the care and maintenance of machines and engines, or, if they happen to be pilots, with the latest knowledge of flying under difficult conditions.

R.A.F. Personnel at H.P.'s.

One of the first firms to engage ex-officers and men of the R.A.F. on a large scale was Handley Page, Limited, whose machines have been so largely used by the R.A.F. that one might almost say a special class of Handley Page specialists was developed in the R.A.F. during the last year of the war.

So many former R.A.F. people are employed by the firm that one cannot very well give a complete list of them without more or less giving away the whole of the firm's works and business organisation, but one may perhaps note the names of a certain number who have already been more or less in the eye of the public.

Lieut.-Col. Stedman, who was the first engineer officer of the R.N.A.S. to be detailed specially for work on Handley Page machines, and who flew in the very first Handley Page machine with Squadron Commander, now Major, John Babington, D.S.O., went to Newfoundland in charge of the machine which was to attempt to fly the Atlantic.

Major Brackley, one of the most famous Handley Page pilots in the R.A.F., is the pilot of the said machine.

Major Gran, better known perhaps as Lieut. Trygve of the Norwegian Navy and of the Scott's South Polar Expedition, and later as Capt. Grant, R.F.C., went to Newfoundland as the navigator of this machine.

Among those permanently employed in this country in connection with the flying of Handley Pages is Lieut.-Col. Edwards, late Assistant-Director of Flying Operations in the Air Ministry.

Lieut.-Col. Noel, who will be remembered as having a machine of his own at the Acton Aerodrome with Messrs. Beney and Lascelles in the very early days of aviation somewhere about 1909, is also with the firm.

Among the firm's regular pilots are Lieut.-Col. Sholto Douglas and Major Foot, both of whom were famous as Handley Page pilots in the R.A.F. during the war.

Major Park and Capt. Stewart, who recently flew the Handley Page round Britain, are also with the firm.

Many other R.A.F. officers are either working for the firm in this country or have gone abroad on special missions, and a number of R.A.F. airmen are employed as mechanics on the machines. It certainly seems that the Handley Page firm is doing all in its power to find adequate employment for the demobilised personnel of the R.A.F.

Short Bros. and Service Aviators.

Yet another firm which is giving worthy employment to ex-Service people are Messrs. Short Brothers. The most senior of all their Service aviators is Mr. E. B. Parker—the firm's London representative—who was a flying officer in the Naval Wing, R.F.C., before the R.N.A.S. was founded, and incidentally was one of the finest pilots the Navy ever had. He was invalided out of the Navy some time before the war, and on his recovery from what was considered to be a fatal illness he joined Short Brothers and has done excellent work for the firm ever since.

Another distinguished Naval pilot now with the firm is Major S. V. Sippe, D.S.O., one of the three heroes of the famous raid on Friedrichshafen in 1914. Major Sippe was at the end of the war in command of the Northern Seaplane Acceptance Depot at Brough, and throughout the war has been intimately concerned with R.N.A.S. work.

Another pioneer of British aviation who is now with Short Brothers is Major O. T. Gnosspelius, who is in fact the first man who ever flew an aeroplane off British water, Windermere being the site of his adventure. Major Gnosspelius has been doing valuable technical work in connection with seaplanes during the war and should be of great value to this pioneer firm.

Yet another R.N.A.S. officer now with Short Brothers is Lieut. W. P. Kemp, who has had considerable seaplane service during the war.

A Good Start.

Among the firms who are doing their best to provide employment for ex-R.A.F. people credit must be given to the Central Aircraft Company, which firm, after doing very good work in the way of aircraft production during the war, entirely on machines of other people's design, has now come forth not only as a designing firm, but also as the proprietors of a well-organised flying school at Northolt Aerodrome.

The aerodrome manager of the firm's school is Capt. N. C. Riddell, late R.A.F., and the pilots are Capt. A. H. Gearing and Lieut. F. B. Goodwin Castleman. Capt. W. Brian Long has also been flying the firm's machines with success.

The firm has quite an ambitious programme in the way of producing multiple-engined passenger machines as well as school machines and two-seater sporting machines at a moderate price, and it is to be hoped that the enterprise shown by the Messrs. Cattle, who are the proprietors of the firm, will meet with the reward which it deserves, and will thus enable them to provide considerably more employment ere long for demobilised officers and men.

The Central Aircraft Company have made arrangements with the Air Ministry to have the use of the R.A.F. Aerodrome at Northolt, which is certainly one of the finest in the country as regards its suitability for training work, and has an area of about 350 acres, nearly all of which provides decent landing ground. The firm is already training its pupils at this aerodrome, and commencing from June 28th they are also giving daily passenger flights.

Northolt Aerodrome is very easy to reach, being close to Northolt Junction on the Great Western and Great Central railways. It is within about half-an-hour's railway journey of London, and the aerodrome is only five minutes' walk from the station, so that actually it is probably the easiest to reach of all London aerodromes, therefore the firm should find its passenger trips well patronised.

The Martinsyde Staff.

Another firm which is doing its duty thoroughly well to the R.A.F. in the way of finding employment for ex-officers and men is the firm of Martinsyde, Limited. Among those who have been actually engaged by the firm are the following:—

Major C. W. C. Wheatley, who will be remembered in the early days at Brooklands as an Avro pupil, and who has since been on technical work in the R.A.F.

Capt. R. Nisbet, an R.A.F. pilot, who was second in the Aerial Derby.

Capt. C. W. F. Morgan, R.N.A.S. pilot, who was engaged as Mr. Raynham's navigator.

Messrs. P. Stimpson and R. Reyer, R.N.A.S. pilots; and Messrs. E. F. Gill, H. C. Kirby, J. H. Clarke, J. Refoy, and A. Wells, all R.A.F. pilots.

Mr. W. F. Savage, late Chief Inspector, A.I.D., has also joined the firm in a technical capacity.

The L. and P. Engagements.

It is encouraging thus to find that so many firms are doing their best to give employment to ex-officers and airmen of the R.A.F. One of the first firms to make a move in this direction was the London and Provincial Aviation Company, who run the Stag Lane Aerodrome at Edgware as a school of flying, and also for the purpose of giving exhibition and passenger flights.

The following officers have already been engaged by this firm:—

Capt. Robert Oxspring, M.C., who is the assistant aerodrome manager.

Lieut. W. T. Warren, jun., who, though of junior rank in the Service, is the aerodrome manager, having been engaged in aviation long before the war.

Capt. Leslie Brake and Lieut. T. Neville Stack, who have both had long experience of Service flying.

The firm has also two ex-N.C.Os. from the R.A.F. employed in their works.

The L. and P. Company has always had a high reputation for honest, straightforward work in its machines and for good, sound instruction at its school, and one hopes that with the growth of Civil Aviation, after the Air Ministry has been brought to a proper sense of its duties, this firm, together with all those previously mentioned, will find it necessary to engage many more of the former personnel of the R.A.F.

Super-Mariners.

The Supermarine Aviation Works, Ltd., of Southampton, have also taken on quite a number of officers of the Flying Services, though their Civil Transport Schemes are not actually in operation at the moment. Here is the list of their officer personnel:—

Squadron Commanders James Bird and B. S. Hobbs (late R.N.)

Captains F. J. Bailey, P. Brend, and J. E. A. Hoare (late R.A.F.)

Lieut. H. G. Horsey, late R.A.F.

Sec. Lieut. H. C. Biard, late R.A.F.

All these officers were originally in the Royal Naval Air Service.

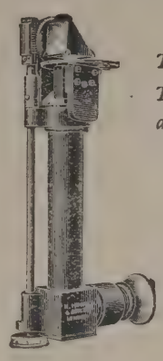
A Big Avro List.

One of the most imposing lists of ex-R.A.F. people now employed in civil aviation is that pertaining to the Civil Aerial Transport firm which is known as "Avro Joyrides" and operates from Hounslow Aerodrome under the direction of Lieut.-Col. G. L. P. Henderson, M.C., A.F.C. The firm is entirely con-

¶ "GRIPOLY" Solid Woven Belting is made from Camel Hair Yarns, with a small percentage of cotton and woven by a patent process which insures the greatest possible strength and evenly consistent wear.

¶ "GRIPOLY" has a triple twisted edge interwoven with the belting which effectively resists fraying caused by guide forks.

¶ "GRIPOLY" Solid Woven Belting is flexible, non-slipping, stretchless, impervious to heat and moisture and variations of temperature. It is the best all round belting.



Let us know your requirements and we will advise you as to the best type of "GRIPOLY" for your needs.

Estab. 1855.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

cerned with running passenger trips in various parts of the country on Avro machines, and it has been extraordinarily successful since it began work, as those who read the weekly reports of civilian aviation in this paper will realise.

Everybody in the firm's employ has been a soldier or sailor, with the exception of a few casual labourers who are merely employed in hauling the machines about, and the pilots are not merely good pilots, but are "A.1 at Gosport" instructors, so that the firm has a very good claim to having the most skilful staff of pilots in the world.

The list of those at present employed is as follows :—

Lieut.-Col. G. L. P. Henderson, M.C., A.F.C., late Wing Commander R.F.C. and R.A.F.—general manager.

Captains R. T. Fagan, D.F.C., A. M. West, and D. I. M. Kennard, late Flight Commanders and R.F.C. and R.A.F. Instructors.

Capt. S. H. Twining, M.B.E., late Wing-Adjutant, R.F.C., and R.A.F.

Lieuts. H. R. Hastings, A.F.C., R. S. Park, A.F.C., E. A. Sullock, A.F.C., A. C. Weeks, and Sparkes, late Flying Officer Instructors R.F.C. and R.A.F.

Airmen R. W. Amey, late W.O., R.F.C. and R.A.F.; A. C. Ayling, late Cpl., R.N.A.S. and R.A.F.; P. Tew, late R.N.A.S. and R.A.F.; A. J. Whittington, late Serjt., R.N.A.S. and R.A.F.; T. A. Badger, late Flt. Serjt., R.F.C. and R.A.F.; E. F. Gordon, late Flt. Serjt, R.F.C. and R.A.F.; H. Rogers, late Serjt., R.F.C. and R.A.F.; H. J. Phillips, 1st Air Mech., R.F.C., and Sec. Lt. R.F.A.; C. F. Lacey, late R.F.C. and R.A.F.; Hughes, late Serjt. R.F.C. and R.A.F.; Field, late 1st Air Mech. R.F.C. and R.A.F.; Sadler, late Flt. Serjt. R.F.C. and R.A.F.; C. V. Jeffreys, late 1st Air Mech. R.F.C. and R.A.F.

Also Miss E S. Smith, late Chief Section Leader, W.R.A.F.

That certainly is a list of which any firm may well be proud.

A. V. ROE & CO.

In addition to the firms already mentioned as having found employment for ex-R.A.F. people, A. V. Roe and Co. have—as might have been expected—done very well in this direction. Here, for example, is the list of those employed by the firm direct, chiefly in connection with the Avro joy-ride undertakings at Blackpool, Manchester, and Hamble :—

BLACKPOOL.

THE AIRCRAFT MANUFACTURING COMPANY'S LIST.

As would be expected, the Aircraft Manufacturing Company includes amongst its staff a large number of ex-R.A.F. officers, and the following list gives an idea of the widespread ramifications of Mr. Holt Thomas's organisation :—

Foreign Representatives :—Major K. E. Clayton-Kennedy, Colonel H. Delacombe, Major S. G. Kingsley, M.C., Lieut. S. B. Bradley, Lieut.-Colonel R. G. Blomfield, D.S.O., Captain H. H. Shorter, Major F. C. Atkinson.

O.C. Flying Operations :—Major C. Patteson, M.C., A.F.C.

Pilots :—Major H. de Havilland, Captain H. J. Saint, D.S.C., Captain W. G. Gathergood, A.F.C., Lieut. H. Shaw, A.F.C., Lieut. E. H. Lawford, A.F.C., Lieut. C. R. McMullin, Captain C. W. Carlton, A.F.C., Captain Carroll.

Business Organisation :—Captain D. M. Greig, O.B.E., Major H. Jones.

O.C. Photographs :—Captain F. R. Logan.

BOULTON AND PAUL'S LIST.

Boulton and Paul, Ltd., give the following long list of their ex-R.A.F. employees, and deserve congratulations thereon.

Major ffiske, London Manager.

Major K. S. Savory, D.S.O., and Captain R. D. Simpson, D.F.C., Special Pilots.

Captain J. H. Woolner, A.F.C., Special Pilot and Navigator.

Captain A. L. Howarth, Wireless Expert.

Lieut. J. E. Jones, Experimental Research Department, Aerodynamics Section.

Experimental Department, Wind Channel :—Lieut. W. H. Sawyer, 1st A.M. H. D. Foulger, and Cpl. L. A. Crickmore.

Experimental Research Department :—Lieut. Mackinolty, Flight Cadet D. Dove, Serjt. R. R. Riley, Capt. E. L. Simonson, 2nd A/M G. E. Morton.

Experimental Workshops :—C/M E. W. Martin, Serjt.-Major Howes, Serjt. Taylor.

C.E. Drawing Office :—2nd A/M G. Pegg.

Production Drawing Office :—2nd A/M R. W. Mallett.

Experimental Research Department, Aerodynamic Section :—A. Zaiman, B.A., Sapper, R.E., attached to Anti-Aircraft Experimental Station at Shoeburyness.

EMPLOYING BY DESTROYING.

In the first report of the Select Committee on National Expenditure, which was issued as a White Paper on June 12th, there is some severe criticism of the Air Ministry. The committee seem to be greatly disturbed by the continuation of the use of high-powered motor cars by officials.

The number of motor cars kept for the use of the Air Ministry at the present time, the committee state, is 48. Of these, 33 are allotted to 33 officials for their own use, and 15 are pooled for the use generally of the staff. Many of the cars are very large and powerfully engined, consuming a quantity of petrol and wearing out many tyres.

Each of the following officials is said to have a car for his own use :—Mr. Churchill (Rolls-Royce limousine), Maj.-Gen. Seely (Rolls-Royce cabriolet), Maj.-Gen. Trenchard (Rolls-Royce landaulette), Maj.-Gen. Sykes (Rolls-Royce cabriolet), Maj.-Gen. Ellington (Rolls-Royce car), Sir A. Duckham (Crossley landaulette), Sir J. Hunter (Crossley landaulette), and Lord Londonderry (Crossley landaulette).

Except that the publication of this list is a very good advertisement for the Rolls-Royce and Crossley firms, one does not see that it serves a useful purpose. There are certain newspapers that cater for the less intelligent section of the community and which during the war found it more profitable to foster distrust between the authorities and the public than to continue their old policy of fanning the flame of class hatred. These will, of course, flaunt the fact that a few Secretaries of State, Cabinet Ministers, and highly-placed officials and such lumber go about their business in cars, while the energetic, highly efficient and virtuous plumber travels in an L.C.C. tram to fetch the tools he leaves behind when he goes to do a job. These journals doubtless would like to see British Secretaries of State, Cabinet Ministers, and distinguished generals riding on the humble pedal cycle or donkey chaise, in order that the resultant loss of time would give further opportunities for criticism.

In spite of all that is said, our highly-placed officials are busy men, and anybody who has any knowledge of affairs is aware that a highly-paid person's time may be worth more than the price of a few gallons of petrol. The commercial world found that out long ago.

One feels that so long as it is kept within reasonable limits the use of motor transport by important chiefs is more than justified, and that it would be more profitable to level criticism at the sinful waste of public money by the scrapping of new aeroplanes of the latest types. Millions have been thrown away in this manner for every few pounds spent on motor cars.

The Select Committee reported that :—

Following the Armistice, the Air Council met and decided to inform the Ministry of Munitions that they required no more aeroplanes. This decision was, however, not adhered to, and in December last they wrote to the Ministry of Munitions stating that they appreciated "that labour and other considerations may prevent the Ministry of Munitions from arranging a complete cessation of further deliveries, and for this reason the Air Council are prepared to continue to accept aircraft and engines of which continued production is required by these considerations."

"Accordingly," proceeds the report, "machines were taken from contractors which were not wanted, and as national factories were also to be kept going, it was necessary to find work for the people there, with the result that machines taken from contractors to keep the people there employed were sent to the national factories to be destroyed to keep the people there employed."

After Christmas, however, steps were taken to cancel contracts, which were brought down from £150,000,000 to £65,000,000. The number of aeroplanes was reduced from 25,000 to 13,432.

So for about two months after the Armistice it would appear that the country was spending money at the rate of £85,000,000 a month on machines which were scrapped as soon as delivered. The idea of keeping contractors busy on the construction of aeroplanes which were "sent to the national factories to be destroyed to keep the people there employed" would be comic if it were not so sad.

It would have been almost as sensible to give the machines to the Germans to encourage them to keep on fighting for the benefit of trade.

THE

LONDON AND PROVINCIAL AVIATION COMPANY,

who have just closed their
Works and Aerodrome,

have the following Aircraft for disposal:

One brand new H. type Avro 2-seater machine (H. 5173) fitted with 110 H.P. Le Rhone Engine and all instruments. Rigged and tested £480

One brand new H. type Avro 2-seater machine (H. 5172) fitted with 110 H.P. Le Rhone Engine and all instruments. Rigged and tested £480

One brand new J. type Avro 3-seater machine (2 passengers and pilot) (J. 5499) fitted with 110 H.P. Le Rhone Engine and all instruments. Will be rigged and tested within a few days £500

All these machines are fitted with streamline wires, and are of the very latest type, built since the Armistice.

CIVIL AERIAL TRANSPORT NOTES.

GREAT BRITAIN.

BIRKDALE AND SOUTHPORT.

The hum of the Avro Air Fleet attracted a huge crowd to the Birkdale Palace Aerodrome, near Southport, last Saturday. Ten thousand people ringed the aerodrome, swarmed on the sand-hills, and thronged the enclosures. The roads approaching the flying ground were blocked with traffic—in fact, no such crowd had been seen at Southport since King Edward VII. visited the city.

The occasion was Lancashire's first aerial fête and gymkhana. Machines came from Morecambe, Manchester, Blackpool, Liverpool, and Preston to compete in the events. Punctually at three o'clock the Avro band, which had flown over from Manchester, struck up a tune as two flights took the air and flew round Southport in formation. The first flight of five machines, led by Capt. E. Maitland Heriot, D.S.C., landed in formation, making a very pretty spectacle.

The next event, a landing competition, in a space of about fifty yards square, gave the spectators some idea of what a modern machine is capable. An imitation fence had been planted in the sand, and competitors had to land as near over it as possible. One or two pilots landed on the near side, and demolished part of the hedge which the officials and judges quickly repaired.

This event was very exciting, both for competitors and spectators, as two or three machines would land side by side within a few seconds of each other.

An acrobatic display followed, all the usual stunts being performed in order, so that the spectators had an opportunity of distinguishing between such manœuvres as a continuous vertical bank, a spiral and a spin.

The big event of the day was a twelve-mile race over the sea and sand. This attracted ten entries, all of whom got off within a few seconds of each other. Lieut. Brown led from start to finish, closely pursued by Lieut. Adams and Capt. Heriot. It was surprising the difference in speed between the machines in view of the fact that they were similar in all respects. The aeroplane "Follow my leader" competition concluded the display, a long string of machines imitating the leader's example in such manœuvres as diving, zooming, turning, and landing.

A silver cup, value 30 guineas, presented by the directors of the Birkdale Palace Hydro, was awarded to Lieut. Brown for the best all-round performance of the day. Fitter Rigby and Rigger Gower, mechanics on the winning machine, were also presented with prizes. Lieut. Adams was judged second, and Capt. Collison third on the day's performance. Major Crossley, R.A.F., and Messrs. C. H. Parr and A. Whittaker, of Birkdale, officiated as judges.

After the event ten machines did passenger flying, and were kept very busy for several hours. The whole exhibition was organised by Major McMinnies, late R.A.F., who is running the "Avro" enterprise in the North of England.

FORMATION OF LANCASHIRE FLYING CLUB.

The first meeting of the Lancashire Flying Club was held at the Birkdale Palace Hydro, Birkdale, Southport, last Saturday after the "Avro" gymkhana. Mr. F. C. L. Young, Lindum Lodge, Bowden, Cheshire, was elected hon. secretary and treasurer. Mr. Young already possesses a machine of his own, and has offered to place it at the disposal of the club's members. It was decided that the subscription for the first fifty members be fixed at ten guineas, without entry fee, and that the club be run primarily for the benefit of ex-service pilots who wish to keep up their flying.

Major McMinnies offered free landings and storage for members' machines at the Avro aerodromes at Windermere, Douglas, Morecambe, Fleetwood, Blackpool, Southport, Liverpool, Preston, Rhyl, etc., and this offer was accepted. It was decided to write to the Air Ministry with a view to obtaining a gift of several machines to the club, with a view to assisting ex-service men to keep up their flying, and it was suggested that the club's machines should be fully insured against all accidents and crashes. All communications should be addressed to the Hon. Secretary, Lancashire Flying Club, at the address given above.

LEEDS.

An aeroplane of unknown make left Leeds on July 18th with two passengers and luggage for Scarborough. Despite the railway strike, they were determined to go on their holiday, and paid £7 10s. per passenger.

LONDON.

HENDON.—Only a few people attended the Victory Meeting on Saturday, July 19th. There were seven entries for the cross-country handicap race of twenty miles, which was won by Capt. H. A. Hammersley on the "Baby Avro." He received the Victory Trophy presented by Percy Edwards and Co. Major R. H. Carr and Captain D. H. Robertson, both on 110 h.p. Le Rhône "Avros," were respectively second and third.

A Grahame-White biplane also took part in the race, and all the machines finished the course, which was five times round Bittacy Hill, and the pylons on the aerodrome.

The first flight to Paris, made possible by the temporary withdrawal of the restrictions, was made on Tuesday, July 15th, from Hendon. Mr. Pilkington, the managing director of Pilkington Brothers, left Hendon, on an "Airco" D.H.9, and arrived at Le Bourget, near Paris, in 2½ hours. The business being completed, a return journey was made on the next day in the same machine.

The first civilian flying certificate issued by the Royal Aero Club since the Armistice has been taken by Private J. Hardy, an Australian soldier, at Hendon.

His Highness the Maharajah of Kashmir and Jamma, with Captain Zuloaga, assistant military attaché of the Argentine Legation, flew from London to Paris on July 13th.

On Friday, July 18th, an Airco D.H.9 carried leaflets required in connection with the North-Eastern Railway strike from Hendon to Durham. This machine then flew to Harrogate, where a D.H.6 arrived on the following day. Both the machines then gave exhibition flights in connection with the Peace celebrations in that town.

CRICKLEWOOD.—A four-engined Handley Page aeroplane piloted by Lieut.-Colonel W. S. Douglas, M.C., D.F.C., left the Aerodrome for Brussels at 7 a.m. on Saturday, July 19th, and arrived there at 10 a.m. Lieut.-Colonel Douglas intends to give a flying display over Brussels, and "Professor" Newell, who accompanied him, will make a descent in a parachute.

MARGATE.

Amongst those taken up in Avros at Manston during the week ending July 19th were three youthful passengers aged fifteen months, four years, and six years. The four-year-old insisted on going up again the same afternoon and was looped.

CANADA.

It has been announced in Toronto that an international air race starting simultaneously from Toronto and New York will be held on August 25th, with the Prince of Wales as starter.

BELGIAN CONGO

According to "La Conquête de l'Air" (Brussels), a seaplane service is to be established upon the Congo.

The service is to provide postal and passenger services, and is also to undertake photographic survey work.

The initial costs are to be defrayed by the Royal funds, and a committee of direction for the organisation of the service has been appointed by Royal decree. This committee consists of Colonel A. E. M. van Crombrugge, Major Paulis, and Commandante Jaamotte.

DENMARK.

Oberleut. Göring, the well-known "jagd" pilot and late chief of the Jagdgerschwader of von Richthofen, represented German aviation at the Copenhagen flying week and exhibition. On May 8th he left Schwerin on a Fokker D.VII with a 185 h.p. Bayer motor, and arrived at Copenhagen (250 km.) in the record time of 1⅛ hour.

According to "Der Motor Wagen" of June 20th, this record and his various exhibition flights made a good impression on the Copenhagen public. The German Aviation Industry can point out with pride the admiration and interest shown for German aerial technique and German Aerial Industry in the first foreign competition in which it enters.

In a report from Copenhagen dated July 17th Reuter states that the Danish Ministry of Justice has issued an order provisionally forbidding flying with passengers, and stipulating that foreign aviators desiring to fly to Denmark must obtain official permission.

A regular air service is intended to be started between Reykjavik, the capital of Iceland, and the eastern ports of the United States.

Two hydro-aeroplanes have already been obtained and will be tested in a flight round Iceland. The route will be from Reykjavik to the southern tip of Greenland, where a station will be established; from thence to Newfoundland, and then on to the United States. The distances of the first and the second stages are roughly 500 nautical miles.

FRANCE.

Captain Marchal left St. Raphael (Var) at 5 a.m. on July 19th on a seaplane, in an attempt to cross the Mediterranean to Bizerta, Tunis, and return on the same day. He followed the Sardinian coast. Five torpedo-boat destroyers were stationed along the route, the total distance of which is about 900 miles. He arrived at Bizerta at 3.30 p.m.

The news given in these notes some weeks since, and afterwards denied in the French Press, was well founded. For personal rea-

Steels of Proved Merit.

When buying a steel, there may be several makers whose claims appear equal. Prices for the same apparent quality may show small differences, but price is not the deciding factor to users of high reputation.

Base your decision on what a steel has DONE.

Two well-known steels have just demonstrated one more argument for their adoption in YOUR engines.

The Rolls-Royce Eagle Engines which won the Atlantic Flight mainly employed these steels.

They proved the reliability of Firth's Nickel Steel for connecting rods, and other important parts, and of Firth's F.C.N.-5 Steel for camshafts, timing wheels and other case-hardened parts.

These and other special steels are at your service NOW, equally carefully made, equally consistent in quality and equally free from defects.

THOS. FIRTH & SONS, LTD.,
SHEFFIELD.

Ever since the R 34 left at frequent intervals the American weather bureau, a most admirable organisation, regarding which you ought to hear the opinions of Mr. Harris, has sent radios giving forecasts based upon more data than are usually available at short notice on your side of the Atlantic. The bureau here works with the utmost personal goodwill, because, to quote its officers, "England has shown the United States remarkable courtesy in allowing an American observer to travel both ways on the first flight, and also given us every information down to samples of the castrol oil for engine-bearings, which we want to analyse for our own purposes."

OVER THERE
R34 in America

THE "DAILY TELEGRAPH" of July 12th contained the cable reproduced here from its correspondent in NEW YORK.

THE LUBRICANT WHICH HAS AROUSED SUCH GRATIFYING INTEREST IS

WAKEFIELD
Castrol
REGD. (R)

which was specially selected for the Sunbeam motors on this famous voyage. THIS IS THE OIL USED BY ALCOCK, HAWKER, AND ALL THE WORLD'S LEADING PILOTS BECAUSE IT IS THE BEST.

C. C. WAKEFIELD & CO., Ltd.,
Wakefield House, Cheapside, London, E.C. 2, England.

sons M. Esnault Pelterie has resigned the Presidentship of the Chambre Syndicale des Industries Aéronautiques. His loss will be greatly felt, for he was always one of the most outstanding figures in French Aviation, and had occupied the presidential chair over ten years. Rumour says that there will be no more Rep machines, as M. Esnault-Pelterie proposes to give his patents to the world to develop. This would not be surprising, in view of the fact that he has already sacrificed a great part of his personal fortune in experiments just for the love of the science.

The French Government did not allow flying over Paris during the fêtes, just as flying was not allowed over London last Saturday, July 19th, but the late Lieut. Navarre had intended flying over the heads of the troops through the Arc de Triomphe, a feat requiring a very small machine, and far more skill than that of flying through the Tower Bridge.

In spite of the restrictions, the "Goliath" and several Farman touring machines, as well as a twin-engined Caudron, flew over the procession whilst it passed through the Avenue de la Grande Armeé and the Champs Elysées. Only a few watching the Victory procession in Paris noticed Captain Fonck carrying the Aviation Corps flag, and Lieut. Arondel, with the Aerostation flag, the only representatives of the great part that aviation played in the war.

M. Etienne Poulet, the holder of the duration record, left Paris for London a few hours after the procession had passed, with photographs for the "Daily Mail." Meeting with very bad weather, he did not arrive at Hounslow until late, but his name is reported to be the first on the aerial customs list there. Later he returned to Paris in 3 hrs. 10 min. The machine accompanying him landed at Calais owing to the bad weather, and the "Evening News" photographer completed the journey on the leave boat.

An aerial postage service was started in June between Paris and Le Croisic, with a stop at Le Mans, where the mails are transferred to other machines. Twenty-seven trips were made in June, four machines being in the service.

M. Louis Damblanc has been working for two years on a helicoplane which he has named "L'Alerion," and which *when successful* will fulfil the following conditions:—Fly vertically with variable ascentional speed; fly horizontally at an average speed of 30-60 m.p.h.; remain stationary in the air; and descend vertically at a variable speed as slow as the pilot wishes. In December M. Roidor Seville will publish the second congress of human flight, which studies especially this aspect of aeronautics.

The French Aerial League Cup is reserved for aviators of French nationality, and will be open for two years, the winner being he who holds it on May 15th, 1921. The holder will be the pilot who, starting from France, flies to the French territory furthest from Europe with a sealed barograph. An addition of 10 per cent. distance will be given in respect of each passenger weighing at least 65 kilogs.

Caudrons are reopening their civilian schools on the first week in August. Instruction will be given on small G 3 type machines. All the flying schools in France closed automatically on the outbreak of war.

GERMANY.

The following article appeared in the "Dusseldorfer Nachrichten," of July 8th:—

Although civilian or peace aviation has not turned out as expected, an effort ought to be made to encourage it, since not only the aeroplane works, but also the wood industry, optical works and motor works, and a score of other trades or industries now depend on the success or failure of the aeroplane as a commercial vehicle.

At the moment, of course, the long-course trips, Berlin to Northern coast, etc., are working satisfactorily, but when the train services are again in order, very few people will be left who will pay the very high aeroplane fares, or the expensive aeroplane postage.

The future of aerial transport for Germany lies more with the extreme long-range of the dirigible, and the long voyages. The future lines, for German air traffic are not "inland" lines, but international lines such as Berlin-Athens—which would considerably shorten the London-India line—Berlin-Lisbon, which will shorten the way to South America.

A message from New York dated July 15th stated that it was advertised in certain German newspapers published there that a Zeppelin freight and passenger service between New York and Hamburg would be started on October 18th, and that bookings would be received after September 18th.

The advertisement was inserted by Hans Kahrs, of the Monopol Export and Import Union, which has its office in New York, but it is not believed that the American Government will permit the establishment of such a service even if it were seriously attempted.

Kahrs was appointed by a wealthy American banker, whose name he would not divulge, to act as agent for this trans-Atlantic dirigible freight and passenger service, which was to be financed by American, British, and German capital. He also said that a tentative price of £18 4s per ton was set as the rate for trans-ocean air freight, but he did not yet know the passenger fare.

Germany is making a determined attempt to establish aviation on a commercial basis. Routes from Berlin are in operation to Weimar, Frankfurt, Leipzig, Warnemünde, Hanover, Westphalia, Hamburg, and Breslau. There are also services between Weimar and Frankfurt, Hamburg and Warnemünde, Leipzig and Weimar, and Hanover and Westphalia.

The services are operated by the Deutsche Luftrhederei, a combine of various German aeronautical firms.

Return tickets are issued and are valid for a period of 30 days. Flying kit and motor transport to and from the aerodrome are provided, and are covered by an inclusive charge, of which the following are representative: Berlin-Hamburg, single, 450 marks; (£22 10s.); return, 700 marks (£35). Berlin-Breslau, single, 500 marks (£25); return, 750 marks (£37 10s.). Berlin-Weimar, single, 450 marks (£22 10s.). Serial tickets available for ten flights on any of the routes operated by the combine are issued at 3,600 marks (£180). These tickets are transferable, and work out at an average reduction of 20 per cent.

Luggage is carried free of charge, but the total weight of passenger—who is carried at his own risk—and baggage combined must not exceed a certain limit. Mails and parcels are also carried by the company, which is working in conjunction with the Hamburg-Amerika Line, through whose offices bookings may be effected.

On the Berlin-Weimar route, which appears the most popular, the number of flights from February 5th to the end of April was 538, while between Hamburg and Berlin from March 1st to the end of April there were 262 flights.

The temporarily suspended postal service between Hamburg and Berlin was to be resumed on the 5th inst.

New services were to be run between Hamburg-Westerland, Berlin-Warnemunde-Heiligendam, and Berlin-Swinemunde, with motor-car connections to Tylbeck, Heingsdorf and Bansin. They depart from Hamburg at 9 a.m., and from Berlin at 3 p.m.

Passengers and parcels are accepted up to an hour before starting time.

The German Luftrhederei Berlin advertises week-end trips to the Baltic seaside resort Swinemunde.

Every Saturday a large aeroplane, fitted with a cabin to hold six passengers, will leave Berlin Johannisthal at 4 p.m., and will reach Swinemunde an hour and a half later. The travellers will be able to spend Saturday, Sunday, and up to Monday morning with their families, the aeroplane taking them back in the morning and carrying them to Berlin in time to attend to business there before noon.

HOLLAND.

Germany is not being allowed to exhibit in the Amsterdam Aircraft Exhibition. This is curious, owing to the progress made by aeronautics in Germany and the fact that the peace treaty has been signed.

AERIAL POST TO HOLLAND.

According to the "Morning Post" of July 17th, the two "Vickers" seaplanes which arrived at Amsterdam from Felixstowe on July 14th, made the flight in connection with an official mission concerning the proposed aerial postage service between England and Holland.

According to the "Nieuwe Rotterdamsche Courant" of July 5th, the directors of the Amsterdam Aviation Exhibition have contracted with Vickers, Ltd., the Aircraft Manufacturing Co., Ltd., the Blackburn Co., Ltd., the Gosport Aircraft Co., and Handley Page, Ltd., for demonstrations on the flying ground of the exhibition. These firms will exhibit both aeriplanes and seaplanes. The Italian Fiat Co. will exhibit their 430 h.p. aircraft engine. The Chairman of the Italian Aero Club has consented to sit on the Exhibition jury.

According to "De Telegraaf" of July 7th, a new single-seater biplane made on a new design by N. V. Med. Antom. en Vllegtuig fabr. at Trompenburg, was successfully put through its tests on the previous day. It is fitted with an engine of 130 h.p. of Clerget type, and develops a speed of 190 km.p.h. The machine has a very strong appearance and is intended to be used as a fighting aeroplane for the Dutch Government.

ITALY.

According to the "Popolo Romano," Signor Gabrieile d'Annunzio is reported to have accepted the post of director of civil aviation in Sardinia.

This is the first time we have heard of the first steps towards an aerial service for the conveyance of fish. Fresh sardines will soon be found at all the fishmongers. One would imagine that it may be difficult to obtain pilots for such an odiferous service.

The envoys of the S.I.T.A., a company for exploiting Italian aero activities in Brazil, have arrived there. The S.I.T.A. is a branch of or from the Macchi Caproni and Gallinari firms and others. Senator Terre and some well-known men are taking active part in the concern.

The newspapers announce the departure for China of a mission which is accompanied by machines and mechanics, and may even start a school there.

Signor Gabrielle D'Annunzio, who recently resigned his commission in order to be freer for certain propaganda work dear to his heart, is now planning a Rome-Tokio squadron flight for September. One believes that his pilots will be recruited from among the naval party which crossed the Alps to Geneva a few days back on a seaplane—a "Savoia" 13 1-P motor and passenger-Taddeoli.—T. S. H.

ROME TO LONDON IN THE DAY.

Lieut. Brack-Papa, the pilot, and Lieut. Bonaccini left Rome on July 15th on their flight to London with the Fiat-built 700-h.p.-engined biplane, which is claimed to be the fastest machine in the world, with an all-out speed of over 160 m.p.h. The engine is the most powerful yet fitted to an aeroplane.

The journey was actualiy started from Turin, at the Fiat works, which is, roughly, 360 miles from Rome, and the average speed over that part of the journey was 161 m.p.h.

Owing to bad weather a stop had to be made at Paris, whence they flew to Kenley aerodrome (225 miles) in 1¾ hours. The journey from Rome to Paris (687 miles) took seven and a half hours. Among the letters carried was one from the Italian Prime Minister to Mr. Lloyd George

The Italian pilot Emilio Taddeoli has flown from Sesto Calende to Geneva, crossing the Alps in his journey on a Savoia seaplane, Type 13, fitted with Isotta Fraschini motors.

Signor Taddeoli left the S.I.A.I. firm's establishment at 9.10 a.m. on July 13th, and flying over the Sempione reached Geneva at 10.6 a.m.

SCANDINAVIA.

According to the "Ekstrabiadet," a German company is scheming to establish a regular airship service between Berlin, Odense, Copenhagen, and Stockholm. Successful trial flights have been made recently with a giant Zeppelin intended for the service, which is fitted with seven engines and able to carry 100 passengers besides its crew. It is presumed that the route will be opened in two or three weeks.

A regular aerial service was started on June 30th by the Austrian pilot, Dr. Konig, between Goteborg and Stockholm. When the works in Goteborg are ready he hopes to start the following regular services:—Stockholm-Malmo, Malmo-Goteborg, and Christiania-Copenhagen.

U.S.A.

The greatest flying exhibitions ever witnessed in America were announced to take place on Saturdays July 19th and 26th in the police aerial exhibition at Sheepshead Bay, Speedway. Over 100 aeroplanes were available.

During the week ending June 21st the forest patrol stationed at Sacramento, California, made twenty-one flights over the National forests, and discovered four fires, which were reported to the Forestry Service.

The Lincoln (Nebraska) Aero Club has opened a flying ground, and the citizens of Nebraska are very enthusiastic on flying, and want more passenger flights than can be given on the six Curtiss aeroplanes. Three more machines have been ordered.

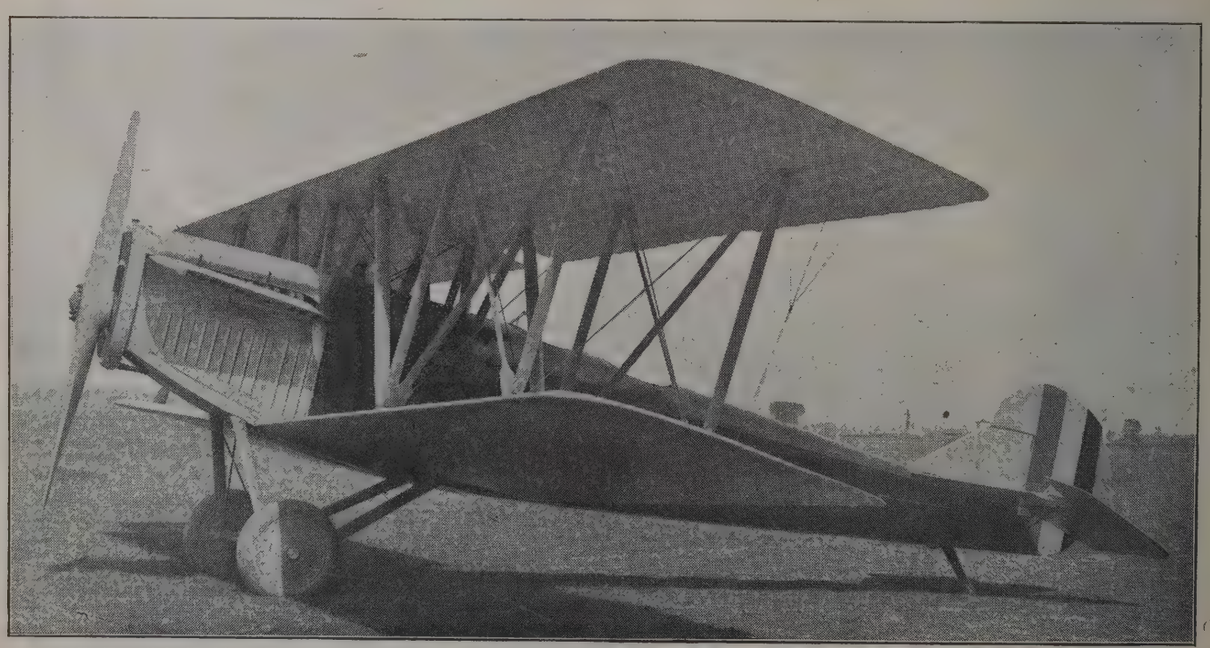
The Universal Aviation Co. have obtained the Morrow Aviation Field at Detroit, which was opened to the public on June 21st. They have four aeroplanes at present, but six more are expected soon.

There is accommodation for sixty machines, and private owners are making arrangements to keep their machines there. A regular passenger service between Detroit and Cleveland will start at once.

Owing to the success of the aerial mail between Cleveland and Chicago (325 miles), over which fifty-eight trips have been made without a single mishap, it is expected that a mail service will be started in the autumn between Omaha and St. Louis, which will shorten the time taken by letters from the Atlantic to the Pacific coasts by 16 to 24 hours.

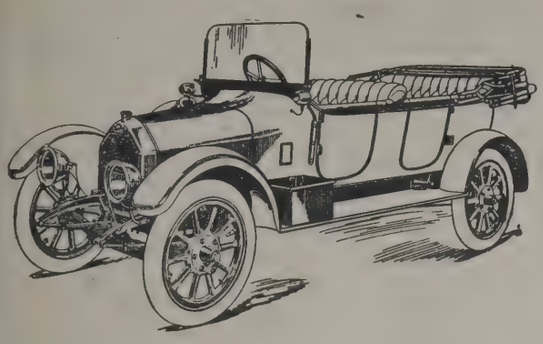
Twelve rebuilt De Havilland machines, fitted with Liberty engines, are on the Chicago-Cleveland route, and carry each day 400 lbs. of letter mail, which amounts to about 16,000 letters. The machines land in the heart of Chicago at Grant Park, thereby saving a great deal of time. Experiments are being carried out to enable the aeroplane to take aboard the mail bags whilst in flight, but this is only possible so far with machines carrying 1,000 lbs. of mail or less.

The Curtiss Aeroplane and Motor Corporation has already established agencies in the Far East, Scandinavia, Australia, and Cuba, and is now planning to extend operations to South America, where bases will first be established at Buenos Aires and Rio de Janeiro, and later in Uruguay, Chile, Peru, and Paraguay. Demonstrating machines will also be sent to Columbia, Venezuela, and Bolivia.



Pioneer aeroplane tours are being planned in America by the Aerial League, of which Rear-Admiral Robert E. Peary is president, to use the surplus Army and Navy machines, to popularise aviation and to give the 64,000 ex-service pilots and cadets a chance of keeping up their flying.

From the canvass made it was found that many wished to participate in these tours for varied reasons, and they are going to start the tours this summer with aeroplanes equipped with motors from 90 h.p., of which the Government has thousands for sale.



Hundreds of cities all over the United States have applied to the Aerial League for assistance and advice in establishing municipal flying grounds. Seaplane tours or cruises will be started as soon as possible.

To begin with, the tours will be divided into four classes:—one-day tours, week-end tours, one-week tours, and three thousand mile tours (ten days). The average travel for one day in these aerial tours will be 250 miles, so as to allow plenty of time for recreation on the ground.

All the tours will start from Atlantic City Airport, in formation, and will pass over and land at New York. The Curtiss Aeroplane and Motor Corporation is planning to enable tourists to hire an aeroplane for one, two, or three months to participate in the tours, at a cost of less than £400 for two people, including insurance.

ROME TO LONDON.—The S.I.A. Biplane (700-h.p. Fiat Engine) on which Lieut. Brack-Papa flew from Rome to London in the day on July 15th.

INVARIABLE RELIABILITY

THE Humber Car is ideally distinctive both in design and finish. It is the superlative example of riding comfort and smooth-running efficiency, reflecting in every detail the many advances made in Motor construction since Motoring was first conceived. It is the acme of economy and endurance—the ideal car.

WHY?

BECAUSE only the best material is admitted into the Humber Works

Because only highly-skilled designers and craftsmen are employed in the production of the Humber Car.

Because the speed of building is only consistent with the time required for the out-turn of a car that has made the name of Humber synonymous with reliability.

Because it **is** a

WHERE IS OUR EXPORT TRADE?

It has been remarked facetiously that statistics can sometimes be made to show everything and in reality prove nothing whatever. This is ostensibly true. The political "figure-twister," commonly known as a political economist, can make one pleased or angry or simply muddle-headed according to his book.

The Board of Trade Returns.

Furthermore, it has been said that statistics are as dry as dust. This may also be true, but when one has before one the Board of Trade Returns for June and studies the condition of the export business of the aircraft it is rather different.

A Small Total for June.

During June there were exported to the Colonies and foreign countries "aeroplanes, airships, balloons, and parts thereof" to the value of £41,526. The comparison is with £35,658 in June, 1918, and £14,647 in June, 1917. Even if one is feeling top-hole and is cheered by the return of warm weather, this is not impressive. On the contrary, it seems so trivial—the more so because the total embraces airships as well as aeroplanes and parts thereof, and even a schoolboy ought to know, after reading all about the cruise of the R.34 and the extra twiddly bits served up by the desperate reporter, that one cannot acquire many private airships for the summer holidays with only £41,526. Not that the average schoolboy has that quantity of pocket-money even if his pater is a profiteer. But the point is made.

The Half-Yearly Comparison Better.

One is rather more gratified, however, with the half-yearly results, for the exports during the six months aggregated £293,646. This compares with £163,458 for the corresponding period of 1918 and £247,573 for that of 1917. Admittedly this sounds a little better, and, moreover, one discovers a big drop in the imports, which, of course, is easily explained by the fact that the war is over. June imports of aeroplanes, airships, balloons, and parts thereof amounted to only £1,410 compared with £864,296 in the same month of 1918 and £2,670 in 1917.

Large Purchases Abroad.

Nevertheless, the aggregate imports for the half-year amounted to no less than £1,949,938 in comparison with £1,989,777 in the first half of 1918 and £62,167 in 1917. It is fairly evident, therefore, that some very big contracts could not be cancelled quickly enough, unless, of course, someone had a fancy for foreign stuff. It is a pity. Such a total is formidable, and it would have been better had the production been diverted to domestic industry.

Trivial Re-exports.

However, one still assumes that it could not be helped, but before closing the illuminating volume, which consists mostly of figures, it is worth while discovering how much stuff of foreign and Colonial origin was re-exported. The total under this head for six months was £400 compared with £1,000 in 1918 and £6 in 1917. Had some more of the imported "aeroplanes, airships, balloons, and parts thereof" been re-exported, someone would have made more profit, and possibly British industry would have received more orders. One says this might have happened. It might not have worked out in such a way.

Conclusions.

The conclusion forced on one after an examination of these statistics is that the export business of the aviation industry is as yet a negligible quantity. This is unfortunate. The necessity of enlarging the foreign business is obvious. If properly developed on efficient lines, with due respect to local requirements and local conditions, and without that essentially British characteristic of trying to palm off on the foreigners, not what the foreigner really wants, but what the British exporter wants him to want, there is a good future.

Wait and See.

Happily the industry is more amenable to reason, doubtless because of the disclosure of German business methods during the war. It is pleasant to reflect that certain interests are building up a foreign business on sound lines, and it is to be hoped that with the exceptional experience gained and the degree of perfection attained the results will be satisfactory in South America, China, Europe, and elsewhere, to the discomfiture of rather keen and lively competitors. WM. J. DAVIES.

CURRENT TOPICS.

A Subdued Feeling.

Although the National Loan has been a greater success than most people expected, the Financial World has not run into ecstasies of buoyant activity. On the contrary, business is smaller, which may conceivably be the result of patriotic gluttony in Loan subscriptions, and the feeling is not by any means enthusiastic.

The Position of Vickers.

Aircraft shares are out of favour and out of fashion, too, for the Whitehead affair is not calculated to make a good impression. However, some things look decidedly cheap. Vickers, for instance, are selling under 36s. Assuming the 12½ per cent. tax-free dividend is maintained, the purchaser would get almost 7 per cent. net on the money laid out, equal to almost 10 per cent. on an investment subject to the deduction of tax. No longer does one hear anything of a bonus arising out of the enormous profits that the company must have made and hidden during the war. The amalgamations and consequent rearrangement of the capital has afforded an excellent opportunity for burying these profits in the business for the benefit of posterity

Some Domestic New Issues.

Petters, Ltd., the oil engine people who have a big interest in aircraft production at Yeovil, are issuing 125,000 7½ per cent. cumulative preference shares of £1 and 12,500 £1 ordinary shares. S. Smith and Sons (Motor Accessories), who are also concerned with aviation, intend to increase the capital to £1,000,000 from £500,000. There will be created 100,000 new £1 ordinary shares and 400,000 £1 6½ per cent. cumulative and participating preference shares. When the ordinary shares receive 6½ per cent. these preference will be entitled to an additional ¼ per cent. in respect of every extra 1 per cent. paid on the ordinary. It is said that two new businesses have been acquired. The English Electric Co., which has a big interest in flying boats, being a combination of the Coventry Ordnance Works, Dick, Kerr and Co., and the Phœnix Dynamo Co., is offering £1,000,000 5½ per cent. debentures at 94.

The Whitehead Aircraft, Ltd.

In the Companies Winding-up Court of the Chancery Division, the petition for the compulsory winding-up of Whitehead Aircraft (1917), Ltd., came up again and was postponed for a fortnight.

Mr. Owen Thompson, K.C., said there seemed to be some prospect of a scheme going through by which all the creditors and debenture holders would be paid, and there would be a surplus for the shareholders. It might be that some scheme would be put forward ennabling everybody to be paid in full.

Mr. Gore-Browne, K.C., said a very powerful combination was negotiating to buy the assets. The prospect of the purchase at a cash price was very satisfactory, but he doubted whether a fortnight would give sufficient time to complete the investigations.

AIRCRAFT IN PARLIAMENT

The following written answer was given on July 9th :—

ROYAL AIR FORCE.—EXPERTS.

Captain WEDGWOOD BENN asked the Under Secretary of State to the Air Ministry whether any steps are being taken to retain for the public service the advantage of the expert designers and craftsmen engaged upon airship and acroplane construction during the War?

Major-Gen. SEELY: It is for the Admiralty to reply as regards airships. As regards aeroplanes, the position during the War generally was that the expert designers were in the employment of the contracting firms, experts on such general questions as aero-dynamics, strength of materials, etc., being retained by the State. It is hoped to maintain this position under the peace organisation.

* * *

The following written answers were given on July 10th :—

WENDOVER AERODROME.

Mr. BRIANT asked the Under Secretary of State to the Air Ministry if the aerodrome at Wendover is intended to be a permanent training centre for the Air Force; and, if so, for how many men is it intended to provide?

Major-Gen. SEELY: The answer to the first question is in the affirmative. The answer to the second will depend on the Peace strength which may be approved for the Royal Air Force.

BRITISH CELLULOSE COMPANY.

Lieut.-Col. W. THORNE asked the Parliamentary Secretary to the Ministry of Munitions what was the total capital outlay of the British Cellulose Company on August 1st, 1916; how much of this had been provided by the State, either in rebate of Excess Profits Duty or in any other form, and what were the total liabilities of the State in respect to this outlay; whether any further capital outlay has taken place since August 1st, 1918; and, if so, does any liability rest upon the State to recoup the whole or part of any such outlay?

Mr. KELLAWAY: I would refer my hon. and gallant friend to the answer given on July 3rd to his question on this subject. Until the Committee appointed by the Government have reported I do not think it desirable to make any statement.

* * *

The following oral answers were given on July 14th :—

ROYAL AIR FORCE (MAJOR F. C. H. SINCLAIR).

Sir WILLIAM DAVISON asked the Pensions Minister why it is that no decision has been arrived at with regard to the application for a pension of Major F. C. H. Sinclair, Royal Air Force, who was invalided out of the Royal Air Force on June 24th, 1918; and when that officer is likely to have his application dealt with.

Sir J. CRAIG: This officer relinquished his commission on July 24th, 1918, but his papers were not received in the Ministry of Pensions until April 13th, 1919. No application was made by the officer to the Ministry in the meantime. The result of the medical board which has now been held is to find the disability not due to nor aggravated by service, and a gratuity of £225 has been awarded and will be paid immediately. The amount may be increased as the result of further inquiry which is being made of the officer.

Captain LOSEBY: Is the hon. gentleman aware that the delays in this and similar cases are causing widespread and intense dissatisfaction?

Sir W. DAVISON: Can the hon. gentleman say if questions of this kind are not dealt with automatically on an officer being invalided out?

Sir J. CRAIG: With respect to the first question, every possible effort is being made to prevent anything of the kind occurring. We are working very hard to overtake the work. The answer to the second question is that the arrangement works automatically, but it has required considerable adjustment between the War Office, the Air Force, and ourselves. We hope, very shortly, to have perfect machinery.

* * *

The following written answers were given on July 14th :—

NAVAL, MILITARY AND AIR FORCE EXPENDITURE.

Commander BELLAIRS asked the Secretary to the Treasury whether the Controller-General has the assistance of expert naval, military, and Air Force officers to assist him in his work of criticising the expenditure of the three Departments.

Mr. BALDWIN: The Controller and Auditor-General has no officers of His Majesty's Forces engaged upon the audit of naval, military, or Air Force expenditure.

AIRSHIP CONSTRUCTION, BARROW-IN-FURNESS.

Mr. T. WILSON asked the Secretary of State for War whether he can indicate the policy of his Department in connection with the building of airships; whether he is aware that, owing to the change over from war to peace conditions, numbers of workpeople are unemployed in Barrow-in-Furness; and whether he can hold out any hope of expediting the construction of airships at Barrow-in-Furness, and thus facilitate the employment of the workpeople now unemployed, and who have in the past been employed on airship construction.

Dr. MACNAMARA: I have been asked to answer this question. As regards the first part, I am not quite sure what information it is that my hon. friend desires. As regards the second and third parts of the question, so far as we are concerned, Messrs. Vickers' airship shed is not large enough for the construction of rigid airships of the sizes now required by the Navy, and it is therefore impossible, under present conditions, to order further rigid airships for construction at Barrow-in-Furness.

WEEKLY HALF-HOLIDAY.

Major-Gen. SEELY (the Under Secretary of State to the Air Ministry), replying to Mr. Waterson, said: The men at Warsash are granted leave from camp on an average of three days out of four, including night leave. There is no Air Ministry weekly order giving the men a half-day on Wednesdays, but at Warsash the men get two free Wednesday afternoons out of three.

STORE BUILDINGS, REGENT'S PARK.

Major-Gen. SEELY (replying to Sir William Pearce) said: The Royal Air Force will make every endeavour to remove their stocks from Regent's Park by September 1st, the date fixed. The buildings will be handed over to the Ministry of Munitions.

* * *

The following oral answer was given on July 15th :—

TECHNICAL PAY.

Sir F. HALL asked the Under Secretary of State to the Air Ministry what amount of technical pay, if any, it has been decided to award to technical officers in Class A of the Royal Air Force; whether the same is to be retrospective from Sept. 1st, 1918, and will include technical officers demobilised before the decision has been arrived at; and, if so, whether an officer who would thus be entitled to additional pay can claim the same together with gratuity based on the larger amount of pay.

Major-Gen. SEELY: I am not yet able to announce the general scheme of pay for the future, but hope to be able to do so shortly, and will my hon. and gallant friend defer his question to a later date?

* * *

The following written answer was given on July 15th :—

DIDSBURY AERODROME.

Major-Gen. SEELY (replying to Major Nall) said: The Didsbury Aerodrome (which is the Whalley-Range Cricket Club premises) will be required for R.A.F. purposes until Nov. 30th, and has been available for civilian flying since May 1st. The future use of this and similar aerodromes is receiving careful consideration.

* * *

The following oral answer was given on July 16th :—

WAR MEDAL ISSUE.

Lieut.-Col. MEYSEY-THOMPSON asked the Secretary of State for War whether he was aware that dissatisfaction exists at the delay in issuing the medal for the European War; and whether this medal will shortly be issued to all the men who are clearly entitled to it.

Mr. CHURCHILL: It is hoped very shortly to issue the Army Order authorising the grant of this medal with permission to wear the riband. I have signed the necessary papers issuing the Order to-day, so that it will be possible for the men to wear it on Saturday.

* * *

The following written answer was given on July 16th :—

AIRSHIP CONSTRUCTION AND MANAGEMENT.

Mr. LYLE asked the Under Secretary of State for Air whether he will give the Estimate for 1919-20 for airship construction and management; and whether he will state the policy of his Department in respect to this branch of airwork, either from a military or from a commercial standpoint.

Major-Gen. SEELY: Expenditure on airship construction for the current year is, under present arrangements, borne on Admiralty Votes. The question of future policy is under consideration.

* * *

The following oral answer was given on July 17th :—

CELLULOSE.

Mr. BONAR LAW (replying to Sir D Maclean) said that he would try to have the Report of the committee which was appointed last August to inquire into the cellulose question circulated as soon as possible, it is hoped this month.

* * *

The following written answers were given on July 17th :—

ANTI-FIRE DEVICES.

Mr. RAPER asked the Under Secretary of State to the Air Ministry whether his attention has been called to the destruction by fire of a British postal aeroplane in the South of France; and whether he is satisfied that all anti-fire devices are used on such machines.

Major-Gen. SEELY: From the preliminary reports received by the Air Ministry it would appear that the aeroplane in question caught fire after "crashing." The provision of "self-sealing" petrol tanks is a great safeguard against fire accidents of this kind, but the progress with this type of tank has been so recent that it has only been possible to fit them in the very latest design of aeroplane. All future designs will provide for "self-sealing" petrol tanks.

AMSTERDAM EXHIBITION.

Captain W. BENN asked the Under Secretary of State to the Air Ministry what steps the Controller of Civil Aviation is taking to assist commercial firms to show machines at the forthcoming exhibition at Amsterdam.

Major-Gen. SEELY: Assistance is being given to private firms by the release of machines and engines, where they have passed the experimental stage, and can be spared from the Royal Air Force. Negotiations have been in progress with the Dutch Government for the opening of civil communication by air between England and Holland during the period of the exhibition.

AEROPLANE CONTRACTS.

Major GLYN asked the Under Secretary of State to the Air Ministry what is the policy of the Air Ministry in regard to either the giving or withholding orders to those small aeroplane manufacturing establishments that are associated with foreign aeroplane companies; whether he is aware that many of these smalled concerns are in an indifferent financial position and are only being kept going in a small way in the hope of later on obtaining a Government contract; and whether it is more in the public interest that these buildings should be used for other purposes whenever definite offers to obtain possession of these factories have been made.

Mr. KELLAWAY: I have been asked to answer this question. I do not quite understand this question, but I may say that the supplies of aeroplanes, contracted for under War conditions, are, and will be for some time to come, sufficient to meet the requirements of the Royal Air Force, without placing further contracts. The use to which the private factories are put is a matter entirely for the owners of the factories.

* * *

On July 17th, in the course of his speech introducing the Civil Services and Revenue Departments Estimates, Mr. ILLINGWORTH (the Postmaster-General) said :—

The question of air mails is one which, naturally, has occupied our attention very much during the war. This has been placed entirely, and quite rightly, under the care of the Air Force. It does not do to have half a dozen people interfering with one thing. The results which have been achieved—I believe mainly privately—in flying the Atlantic have been very remarkable.

The first attempt by Hawker, unfortunately, was not a complete success, but he managed to deliver a small number of letters which he was bringing, and they were quite safely delivered in London. I received a letter from the Postmaster-General of Newfoundland, to which I replied in suitable terms.

The next attempt, by Captain Alcock, was completely successful. He flew in sixteen hours from Newfoundland to Ireland, and managed to deliver his mails in a very satisfactory condition and in a short time.

What I consider to be one of the most remarkable achievements was that just accomplished by the R 34—the lighter-than-air ship—which

"STEEL" — The Edgar Allen Service.—(8)

On our technical staff is an expert, who during the war supervised the production and design of leading aeroplane engines. His long experience with steels make his advice on them invaluable. It is at your service.

Besides the literature mentioned in our last advertisement there are

Edgar Allen's

"Story of the Saw." An illustrated brochure about circular saws.

"Red Label Steel." A folder about a special deep-hardening Tap Steel.

"High Speed Twist Drill List." Prices and equivalents sizes in inches, fractions of inches, and mill metres.

Write for whichever interests you, stating name of firm.

MAY WE QUOTE YOU?

Established 1849.

went from here to America in an incredibly short time, made a round, and came back to this country again. I sent a letter to the Postmaster-General of Canada by the R.34, and a few hours after she arrived back in this country his reply was delivered to me at the General Post Office in London.

Of course, these things do not make the question of air mails a practical proposition, but it has been shown that there are great possibilities. In the course of time, if the progress made is as rapid as has been made in the flying branch of the Army, before many years the long-distance post, at any rate, will be carried by either lighter- or heavier-than-air machines.

Captain W. BENN: What about internal mails by air in these islands?

Mr. ILLINGWORTH: At present the great difficulty is the state of the atmosphere. I am told there is great difficulty in navigating in a hazy atmosphere and also in landing. I am informed that when that is overcome it will be a practical proposition for the longer distances. I do not know what means are taken to fly and land in thick weather, but I gather that it will not be beyond the resources of the people of this country to do that.

Captain WEDGWOOD BENN, in the course of his speech, said:—I want now to touch on a matter which is not a complaint, but which, I hope, will have a stimulating effect on the policy of the right hon. gentleman's Department, and that is the question of aerial mails.

The War Secretary made a speech the other day in which he said, proudly, that we were at the head of aviation in the world. I am sure we would like to lead, and I am sure we have got some of the best manufacturers in the world, but I am not at all sure that in practical ways we are at the head of aviation, particularly in this matter of aerial mails.

We all know that developing new aerial routes is a very expensive matter. It will be, in my judgment, a very useful development indeed, and I think the commercial possibilities of an aerial mail service in particular are considerable, because a mail does not weigh very much; it is not like carrying passengers. But you cannot expect private firms to do this out of their own funds; it is too expensive.

The risks are too great, and it is a service which properly should be undertaken by the Post Office, in conjunction, of course, with the Air Ministry. Of course, being, as I am, a most firm believer in the necessity or unity in the Air Service, I should be against the right hon. gentleman in his Department starting a little air service of his own.

It must, of course, be done by the Air Ministry, but then the Postmaster-General should be an employer of the Air Ministry, and use them for this very necessary service. I ventured to interject a remark during the right hon. gentleman's speech, touching this matter, and he replied that it could not be done owing to the atmospheric conditions.

I think he has rather overstated the difficulties. It is not necessary for an aerial mail service to fly high. It is not necessary to have very swift machines—it is advisable to have them for long distances—but a sort of machine like the D.H.10, which lands very slowly, and could be used for this purpose, would very much diminish all the dangers of which the right hon. gentleman spoke.

I think you could get a very large measure of success—I will not say 100 per cent., but certainly 90 per cent. of success. I wish the right hon. gentleman would turn his attention to that, because the Air Estimates are very large—£65,000,000—and you can only justify estimates of that size if the Air Ministry sees that we do not fall behind other countries in civil aviation. It would be lamentable if we allowed the great lead we secured during the war to be taken from us.

Let me tell the right hon. gentleman of some of the things that are happening in the world in the direction of aerial mails. In the forefront is the United States. It is more than a year ago since the United States instituted a daily aerial mail between Washington and New York, with one stop at Philadelphia. As people very often say that these islands are not big enough to have an aerial mail, it is interesting to notice that the distance between Washington and New York is about 210 to 220 miles, and the whole of last and during this year this service has been run with very great success.

I want to mention the various countries in which the thing has been done, in order to bring to the right hon. gentleman's notice the possibility of doing it. During the war there was, I believe, a daily mail service between Vienna and Budapesth; in Denmark a daily service between Copenhagen, Gothenburg, and Christiania; in France there were several, including a very constant service, used for Government purposes, between London and Paris; in Germany a daily mail service between Berlin and Munich, with an average time of four and a half hours.

In Greece a daily mail service has been attempted. In Italy, the submarine difficulty was overcome by sending mails to Sardinia by aeroplane, and, as a matter of fact, there were many other services. As regards Brindisi and Valona, one can see the enormous advantage of sending mails over the neck of the Adriatic. In Spain there are two projected lines. Surely the example of these foreign countries should be sufficient to encourage this country to make a bold start.

It seems really lamentable that even now, with the war over, and with hundreds of surplus machines, we should not make a start. The Air Ministry has got large contracts with the manufacturers, and the manufacturers, I believe, are ordered to continue them. I think I am right in saying that in many hangars in this country machines are pouring in, are being heaped up and are deteriorating, and never see the air at all. Yet the right hon. gentleman has not utilised any of these machines even for an experimental air service.

This is such a fascinating subject that if I did not check myself I am afraid I should weary the whole Committee, but they have even got so far as to have aerial stamps. In Newfoundland they produce stamps for the Atlantic air post. In Tunis they have a converted 25 centimes postage stamp. In Switzerland they have a stamp for the air post between Zurich and Lausanne, and elsewhere, so that other countries are getting to work in every way to develop this air service which we are neglecting.

The right hon. gentleman will no doubt say in reply to this. "It is all very well, but what would happen would be that you would start thing, everyone would send their letters, there would would be a great many failures, and the whole idea would be discredited." That is the sort of answer I anticipate.

Let me give him some figures which I got only a fortnight ago showing the success of the service in the United States. These are not newspaper reports, although those reports are very often more illuminating than official documents, but these figures I am giving have all the sanctity which belong to papers issued by Government Departments. The first annual report of the aerial mail service between Washington and New York has been published, and this is what it says:

"Out of a possible 138,000 miles for flying "(that is the number of journeys added together) "128,000 miles were actually flown—a performance of 92.73 per cent. Out of 1,263 trips, only 55 were abandoned owing to the weather, and during the twelve months there have been only 17 forced landings, and the balance-sheet"—(this will surely induce the right hon. gentleman to consider it favourably)—"shows a surplus of 10,000 dollars."

That is all I have to say, but I do think it is much more than merely a wild dream of those who, like myself, are enthusiastic over aviation. I think it is a practical step, which the right hon. gentleman would do well to consider seriously.

The following answer, which was given on July 21st, is taken from the "Times," the Official Report being too late for publication:—

SERVICE CONDITIONS FOR THE AIR FORCE.

Major-Gen. SEELY (Under Secretary of State to the Air Ministry), replying to Mr. Raper, said:—The rates of pay, pension, and allowances for officers of the reconstituted Royal Air Force have now been approved, but, as the details are too lengthy to be brought within the compass of an answer to a question, I will ask my hon. and gallant friend to allow me to circulate the full statement with the votes.

An important feature of the new system is that, whereas at present the various branches have each had their own rates of pay, in future there will be uniform rates for all branches, with the exception that certain branches, such as medical works and schoolmasters, will continue to have special rates as hitherto.

Except for these branches, all officers joining the Royal Air Force in future will pass the flying test. The rates have been fixed with reference to the present high cost of living, and will be subject after five years to change, either upwards or downwards, according as the cost of living rises or falls.

Subsequent revisions will be made at three-yearly intervals on the basis of Board of Trade food prices. The new rates are intended to apply to those officers who are given permanent or short-service commissions in the force as reconstituted or who are seconded to the Royal Air Force from the other Services.

With regard to the pay of other ranks, I hope to be in a position to make a statement during the present week.

THE ROYAL AERO CLUB.

A special meeting of the committee was held on Tuesday last, July 15th, 1919, when there were present:—Brig.-General Sir Capel Holden, K.C.B., F.R.S (in the chair), Major-General Sir Sefton Brancker, K.C.B., Mr. Ernest C. Bucknall, Lieut.-Col. Spenser D. A. Grey, D.S.O., R.A.F., Lieut.-Col. T. O'B. Hubbard, M.C., R.A.F., Lieut.-Col. F. K. McClean, Lieut.-Col. Alec Ogilvie, Col. C. R. Samson, D.S.O., R.A.F., Mr. A. Mortimer Singer, Mr. T. O. M. Sopwith, and Mr. Harold E. Perrin, secretary.

ELECTION OF MEMBERS.—The following new members were elected:—Major Thomas Morgan Barlow, R.A.F.; Capt. John Claude Beddard, R.A.F.; Lieut. Edgar Hastings Cambridge; Lieut.-Com. Kenneth Mackenzie-Grieve, R.N.; Lieut. Albert Charles Guyer, R.A.F.; Lieut. Harold William Hern, R.A.F.; Nicolas Herzmark; James Inglis Ker, J.P.; Francis Martin Luther, Lieut. John Marsden, R.A.F.; Emil Adam Merckel; Lieut. William Thomas Simpson; Capt. Maurice Hugh Stephens, R.A.F.; and Lieut. Bernard Noel Wills, R.A.F.

ROYAL AERO CLUB AND SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS.—An agreement has been entered into between the Royal Aero Club and the Society of British Aircraft Constructors defining the activities of the respective bodies. A joint committee has been appointed to act as the channel of communication by which the two bodies are kept in touch and to advise generally upon matters affecting their common interests. The following are the representatives of the club on the Joint Committee:—Lieut.-Col. F. K. McClean, Lieut.-Col. J. T. C. Moore-Brabazon, M.P., Mr. J. H. Nicholson, and Lieut.-Col. Alec Ogilvie.

N.C.4.—The following letter was read from Lieut.-Com. H. C. Read, U.S.N., commanding N.C.4:—

U.S.S. Zeppelin,
At sea, en route New York, June 18th, 1919.

Royal Aero Club,
3, Clifford Street, W., London, England.

Gentlemen,—I am taking this opportunity, the first peaceful moment since first arriving at Plymouth, to thank you on behalf of myself and the crew of the N.C.4 most heartily for your welcome to us during our stay in London.

As a consequence of the care with which the members of the club looked after our welfare, the visit to London will always remain the brightest spot of the entire trip. Hoping some day to be able to repay you, at least, in part, I remain.—Very sincerely yours,

(Signed) H. C. READ,
Lieut.-Commander, U.S.N., Commanding N.C.4.

R.34.—The following cablegram was sent to Brig.-Gen. E. M. Maitland, C.M.G., D.S.O.:—

"Royal Aero Club sends heartiest congratulations to Major Scott and crew of R.34.—ATHOLL, Chairman."

The following reply was received from General Maitland:—

"President, Royal Aero Club, London,—Scott and crew R.34 much appreciate kind messages congratulation.—GENERAL MAITLAND."

COMMITTEE MEETINGS.—It was decided that meetings of the committee should be held in future on alternate Wednesdays, instead of Tuesdays.

CLUB BANQUET TO BRIG.-GENERAL E. M. MAITLAND, C.M.G., D.S.O., MAJOR G. H. SCOTT, AND THE CREW OF H.M.A. "R.34."—The club will entertain the officers and crew of H.M.A. "R.34" at a banquet at Prince's, Piccadilly, W., on Wednesday, July 23rd, 1919. Particulars are being forwarded to members by post.

THE FLYING SERVICES FUND.

(Registered under the War Charities Act, 1916.)

ADMINISTERED BY THE ROYAL AERO CLUB

For the benefit of Officers, Non-Commissioned Officers and Men of the Royal Air Force who are incapacitated while on duty, and for the widows and dependants of those who are killed or die from injuries or illness contracted while on duty.

HONORARY TREASURER: The Right Hon. Lord Kinnaird.

COMMITTEE: H.R.H. Prince Albert, K.G. (chairman), Mr. Chester Fox, Lieut.-Col. T. O'B. Hubbard, M.C., R.A.F., Lieut.-Col. C. E. Maude, R.A.F., Lieut.-Col. R. H. More, C.M.G.

SECRETARY: H. E. Perrin.

BANKERS: Messrs. Barclays Bank, Ltd., 4, Pall Mall East, London, S.W.1.

Total subscriptions received to July 8th, 1919 ...	£15,066 4 9
Collected at Church of England parade services at Headquarters, South-Western Area, Royal Air Force, Salisbury	6 11 6
Lieut. H. A. Turrill, R.A.S.C.	2 2 0
Total, July 15th, 1919	£15,074 18 1

PRESENTATIONS TO THE CLUB.

The following books have been presented by the publishers to the Club Library:—

"The Year Book of Wireless Telegraphy and Telephony, 1919." (Published by the Wireless Press, Ltd.)

"Practical Aviation." Including Construction and Operation. By J. Andrew White. (Published by the Wireless Press, Ltd.)

"Les Moteurs à Explosion dans l'Aviation." By A. Masméjean and E. Bérèhare. (Published by H. Dunod and E. Pinat.)

"Résumé des Connaissances Scientifiques utiles aux Aviateurs et Mécaniciens de l'Aéronautique." By Ed. Marcotte and E. Bérèhare. (Published by H. Dunod and E. Pinat.)

"The Wonder Book of Aircraft." Edited by Harry Golding. (Published by Ward, Lock and Co., Ltd.)

AN OPPORTUNITY FOR YOUNG MECHANICS.

It is difficult to think of a reason why the London Regiment should be so interested in the future of the R.A.F. (T.F.), but it is doubtless a good thing for one well-established Territorial regiment to interest itself in the inauguration of another, however different their ultimate aims may be.

The First Aircraft Construction Wing, which was opened on June 20th by Maj.-Gen. Sir Hugh Trenchard at 25, Camden Rd., St. Pancras, is backed by many well-known and influential people. Most of the biggest aircraft firms have interested themselves in this wing, and have shown their interest and appreciation by giving large sums of money, aeroplanes, engines, spare parts and workshop appliances.

Throughout the war there was never much difficulty in obtaining pilots and observers, but there was a great shortage of good mechanics, for many joined up at the beginning of the war in infantry regiments and many were kept on work of national importance in the factories. There will never be any difficulty in obtaining men who will want to be trained as pilots; but the mechanics who served during the war in the R.A.F. have mostly had quite enough of the Air Force, and find they can earn far more money in factories and in other civil engineering jobs.

This shortage of mechanics shows the necessity for training youths as such, for a R.A.F. (T.F.) cannot consist of pilots alone, and the first step in the right direction is to open these wings to procure the mechanics.

The following article by "Percy Vere" gives the details of the scheme :—

Formation of Sections for Elementary Instruction.

A movement which will have a far-reaching importance in the near future was brought into being recently, when the Chief of the Air Staff (Major-General Sir Hugh Trenchard, K.C.B., D.S.O.) opened the headquarters of the First Aircraft Construction Section in connection with the Cadet organisation of the Territorial Force Association of the County of London.

Soon after the Armistice steps were taken to form an Aircraft Construction Section in connection with the local Cadet battalion at St. Pancras. The Air Ministry were approached with a view to ascertaining what support, if any, would be forthcoming in the event of such a section being formed, as the question of equipment was all important. The response was really splendid. Every encouragement was given to the scheme, and a valuable gift of instructional equipment made.

Various important firms were also approached with a view to obtaining the grant of instructional stores, and the following firms replied with generous gifts :—Vickers Ltd., Sir G. W. Armstrong-Whitworth and Co., the Beardmore Engine Co., the Sopwith Aviation Co., A. V. Roe and Co., W. G. Allen and Co., of Bedford, the British Caudron Co., the Grahame-White Co., Ruston and Hornsby, the North British Rubber Co., and Berwicks of Park Royal. This equipment forms the instructional material used by the section to-day.

It has been proved by the large number of Cadets coming forward for instruction already that the scheme is likely to be popular.

The Classes.

Classes are held from week to week, conducted by qualified ex-flying and other officers and other ranks of the Royal Air Force who have now accepted commissions in the Cadet organisation of the County of London Territorial Force as instructors, assistant instructors, lecturers, and demonstrators. The subjects taught include aero engines, rigging, theory of flight, navigation, instruments, signalling (including wireless), drill and physical training. Sports and games are also freely indulged in.

The strength of the first section is 85 Cadets, 7 N.C.Os., 2 warrant officers, and 7 officers. The organisation is clearly defined on approved lines, and proving quite satisfactory.

The establishment of each section comprises the officer commanding, a chief technical officer, and officers in charge of the various sub-sections. These are assisted by junior officers, and also technical sergt.-majors. The principal qualification for entry as an officer in these aircraft sections is that the applicant should have served in the Royal Flying Corps, Royal Naval Air Service, or later in the Royal Air Force.

The movement has already commenced to expand, and steps are now being taken to bring the whole of the Cadet units in the County of London into line, and sections dealing exclusively with aircraft are being formed in connection with all the Cadet battalions affiliated to the well-known London Territorial battalions.

It is interesting to note that about 50 per cent. of the Cadets now under instruction have served during the war in a civilian capacity in some of the best-known aircraft factories in London, and they are continuing their studies with a view to further advancement. It is found, in this connection, that the Cadets are exceedingly keen, and attend the lectures given regularly. For some time recruiting has had to cease, but arrangements are now concluded whereby lads from seventeen to twenty years of age may enrol.

The Need for Good Mechanics.

The aim of these sections is to prepare the Cadet to be a specialised mechanic, for it is realised by those concerned that a mechanic must know the fundamentals of his own duties thoroughly; no other consideration can compensate for a defect in this. The pilot depends, finally, on his aeroplane; his mechanic, therefore, should know sufficient to see that it is always kept in perfect order. These sections are in being at the moment at any rate for the express purpose of training the Cadet, in his spare time, in all matters relating to aircraft to enable him later in life, without loss of time, to take up responsible duties either in the Royal Air Force or in aircraft manufacturing works almost from the beginning instead of being a drag on his squadron or works for weeks.

In the formation of new sections great stress has been laid as to definitely deciding at the outset on a system to be adopted. Sections have, therefore, endeavoured to organise their system, develop their methods, and set themselves some kind of standard, as well as keep a proper balance for all subjects taken. The individual members of staffs—probably inexperienced in instructional work—may view their particular subjects in false perspective, i.e., they may unconsciously endeavour to produce a first-class mechanic in twenty-four hours. This cannot be done.

Co-operation between all sections will be established, and this should tend to raise the standard of all to that of the best. The civil and military aircraft authorities decide what is wanted in the development of aircraft, and the sections will do their best to comply to the best of their ability in the time. By close co-operation and co-ordination the experience of all the sections is at the disposal of each, and gives rise to a healthy emulation among the various staffs.

Visits to Works and Aerodromes.

Arrangements are made from time to time for Cadets to visit works and aerodromes, and cinematography also plays a very important part as an aid to instruction.

The movement is full of possibilities, and as it is now only in its infancy it is difficult to imagine to what extent it may prove its usefulness. It has, however, been more than proved that recruits can be obtained, clearly indicating its popularity. It has also been seen that Cadets get so keen as to wish to transfer into the Royal Air Force for training as learner mechanics, as quite a number have already done so. Those interested in civil and military aviation realise this, and it is hoped that the lead already given by official and private concerns will be a means of bringing into being a much larger movement for the training of the lads. At the moment, therefore, it deserves every encouragement, and the visit of the Chief of the Air Staff and the Director of Training has already been a means of drawing the right type of lad who is anxious to qualify in one of the most interesting crafts of our time.

ESPRIT DE R.A.F.

A year or two ago, very many members of the R.A.F. looked forward to a future in their Service.

In the words of the average flying officer, "What a hope!"

The Selection Board have shown such dainty discrimination in their selections, that a number of the older members have fled to the friendly cover of civilian clothes, and the gold oak-leaves and banana-adorned badges of their caps grow dim in the recesses of some forgotten cupboard.

And those other old pilots who were oak-leafless murmur "Blow the Bolo," or alliterative words to the same effect, and thankfully retire into private life again.

It seems a pity that many who would have continued in the R.A.F. should have been frightened out of it by the thought of those with whom they would associate; and good traditions for a new Service are not being created by the type of officer frequently seen.

With luck he may occasionally speak comprehensible English, and his clothes would make an excellent lubricant for any engine. In many cases his service overseas dates from the signing of the armistice, and he is receiving a bonus for reaping where others sowed before him. He, in fact, is the soul-inspiring foundation of a new Service, and he is known to the public as "the gallant British airman."

His confrère, who was ass enough to be demobilised and is sorry for it can be seen with the R.A.F. badge in his buttonhole, on his cuff-links, in his tie, or worked on his socks, and perhaps he wears a pair of wings on his waistcoat. This is not necessarily typical, but it is all sufficiently noticeable amongst many of the Selection Board's choice.

Meanwhile, those who once had a pride in their Corps, are rapidly selling their uniforms to old clothes merchants, and wondering what has become of that pride.

Anyhow, God bless the R.A.F.

— R. R.

NAVAL & MILITARY AERONAUTICS

GREAT BRITAIN.

FROM THE COURT CIRCULAR.

BUCKINGHAM PALACE, July 17th.

His Majesty conferred decorations as follows :—

THE DISTINGUISHED SERVICE CROSS.—Capt. Cecil FitzHerbert, R.A.F.

THE MILITARY CROSS.—Capt. Thomas Lander, Highland Light Infantry, attd. R.A.F.

MARLBOROUGH HOUSE, July 17th

Brigadier-General E. M. Maitland and Major C. H. Scott, Royal Air Force, were received by Queen Alexandra to-day.

BUCKINGHAM PALACE, July 16th.

Admiral Sir James Startin and Brig.-Gen. E. M. Maitland and Major C. H. Scott, R.A.F., had the honour of being received by The King this morning.

BUCKINGHAM PALACE, July 19th.

Their Majesties gave a Luncheon Party in the State Dining Room in honour of the Representatives and Leaders of the Allied Armies, at which the Prince of Wales, the Prince Albert, the Princess Mary and Field Marshal the Duke of Connaught were present, and the following had the honour of being invited :—

The Right Hon. Winston Spencer-Churchill, M.P. (Secretary of State for War and Air), and Major-General Sir Hugh Trenchard.

NAVAL.

ADMIRALTY, July 17th.

The King has been pleased to give orders for the following appointment to the Most Excellent Order of the British Empire, in recognition of the services of the following officer during the war :—

O.B.E. (MILITARY DIVISION).

Flt. Lt. A. W. Cassy, R.N.A.S. (now Capt., R.A.F.).—For valuable services with No. 14 Kite Balloon Section in Mesopotamia from Aug. 1916, to Feb., 1917.

The King has been pleased to approve of the award of the following decoration to the undermentioned Officer :—

DISTINGUISHED SERVICE CROSS.

Lt. D. R. Verey, R.N.V.R. (now Capt., R.A.F.).—For distinguished services with No. 14 Kite Balloon Section in Mesopotamia from Aug., 1916, to Feb., 1917.

Flt. Sub. Lt. M. Lyon, R.N.A.S. (now Capt., R.A.F.).—For distinguished services with No. 14 Kite Balloon Section in Mesopotamia from Aug., 1916, to Feb., 1917.

ADMIRALTY APPOINTMENTS.

The following appointments have been made :—

JULY 16th.—Surgn. Lieut. (Temp.).—E. D. Granger, temp commission and appt. terminated on transfer to R.A.F., Oct. 1st, 1918.

JULY 17th.—Surgn. Lieut. (Temp.).—A. Ritchie, M.B., to "Vindictive."

BOSN.—W. C. Hawkins (actg.), to "Ark Royal," July 18th.

* * *

On July 15th H.M.A. N.S.11 was lost at sea with all hands owing to an explosion. N.S.11 left Pulham Airship Station shortly after midnight on July 15th to assist in mine-sweeping operations, and the explosion, which was heard along the coast, occurred near Sheringham at about 12.30 a.m. No official statement has been issued regarding the cause of the accident.

The names and address of officers and ratings of N.S.11 are as follows :—

Capt. W. K. Warneford (commander), Lansdowne House, Huyton, Liverpool.

Capt. A. S. Elliott, who had recently been staying with his wife at Harleston, Norfolk.

Flt. Serjt. O'Connor, Macfarlane Road, Wood Lane, Shepherd's Bush.

Serjt. Lewry, Leesland Road, Gosport.

Serjt. Waghorn, Star Inn, Crayford, Kent.

Aircraftsman J. Jacques, Victoria Road, Longeaton.

Aircraftsman Cameron, Beasley Street, Gorton, Manchester.

Aircraftsman Connelly, Midfield Cottage, Inveresk, Midlothian, Scotland.

It has been definitely ascertained that the airship foundered four miles north-west of the village of Salthouse, between Wells and Sheringham.

The following message has been received from the King in regard to the loss of Coastal Airship N.S.11 :—

> His Majesty the King desires to express his deepest sympathy with the relatives of those officers and men who lost their lives in the airship N.S.11 while employed in mine-clearing operations.

N.S.11 was built by the Admiralty at Kingsnorth, Kent, in 1918, and had some good work to her credit, including a voyage of 1,285 miles along the coasts of Denmark, Slesvig-Holstein, Helgoland, North Germany, and Holland, the time taken being 41 hours. It was N.S.11 which recently made the flight over London flying the newly-resigned R.A.F. flag.

Dragging operations off Cromer were begun on July 19th by several minesweepers. If any wreckage of N.S. 11 is discovered a diver will be sent down. An attempt will be made to recover the engines in order that they may be examined.

* * *

The Air Ministry announced on July 21st :—

One of the F.5 flying boats engaged in the Scandinavian trip reached Christiansand from Dundee yesterday at 5.30 p.m., having accomplished the journey of 430 sea miles in seven hours and a quarter. As the flight was made through thick fog and driving rain, the performance is regarded as a particularly good one.

* * *

Two Naval flying boats from Felixstowe arrived at Schellingwoude, the Dutch Naval aerodrome near Amsterdam, on July 14th. The crews consisted of five persons, including Colonels Waterhouse and Raikes. The pilots were Major Moon and Captain Maxton. Captain Freeman and Lieut. Parker were among the crews. The time taken on the journey was, roughly, an hour and three-quarters.

* * *

The British Naval flying-boat F.5-N.90 (Rolls-Royce engines), piloted by Captain Baily, R.A.F., with Major Sitwell, D.S.C., R.A.F., in command, arrived at Copenhagen at 5.30 p.m. on July 19th. An official from the Foreign Office and two N.C.Os. were also carried.

The course followed was Felistowe to the Dutch coast, along the Dutch coast to Borkum, along the German coast to the Kiel Canal, and so to Copenhagen. Bad weather was encountered and much rain. An altitude of between 600 and 2,000 ft. was maintained.

The flying-boat left Copenhagen for Helsingfors at 11.10 a.m. on July 20th.

* * *

Owing to the difficulty of bringing any type warship up to London for the Peace celebrations, the next best course was adopted, and a very representative collection of what may be described as the "last sigh" in naval architecture and construction was congregated at the mouth of the Thames off Southend, and at certain times on certain days were open to public inspection.

Perhaps the most interesting feature was the presence of H.M.S. "Furious," variously described by the intelligent Press and the more intelligent public as a light cruiser, battle cruiser, etc., commonly known as a "Hush-Hush" ship, whatever that may mean, and officially known as an "aircraft-carrier."

Two folded Short seaplanes on the deck added to its mystery and greatly impressed the public.

Most of the battleships and battle cruisers sported a couple of ship-planes, mostly "Camels" and "1½ strutters," although "Revenge" carried a Parnall "Panther" on the fore barbette.

The ignorance of the British nation in general, in things that really concern the premier Naval Power in the world, is remarkable, and if one has the patience a very amusing time may be spent in listening to scraps of conversation concerning the very interesting array of all types of craft from "Furious," "Royal Oak," etc., down to the "K" submarines and the speedy Green engined C.M.Bs. which lay in four lines from a point opposite Leigh to well past Shoeburyness.—L. L. B.

MILITARY.

FROM THE "LONDON GAZETTE."

WAR OFFICE, JULY 15TH.

The King has approved of the award of the Military Medal for bravery in the field to the following Warrant Officer, Non-Commissioned Officers, and Men, Royal Air Force, for services in France, except where otherwise stated :—

9991 Cpl. L. Briffault (41st Squadron); 35291 Flt.-Serjt A. Carey (15th Balloon Co.); 23271 Serjt. A. Clark (11th Balloon Sec.); 31415 Cpl. W. Clayton (4th Squadron); 47099 A.M./2 F. E. Cursley (149th Squadron); 24982 Cpl. C. J. F. Gibson (8th K.B. Sec.); 10098 Cpl. G. L. Goodger (59th Squadron); 37515 L.A.C. P. E. Groves (65th Squadron); 10618 Cpl. E. J. Iredale (No. 1 Aircraft Depot); 13677 Ch. Mech. P. Junor (15th Balloon Sec.); 7740 L.A.C (actg. L./Cpl.) R. King (15th Wing); 96727 A.M./2 C. S. Lacey, (attd. 199th S. By. R.G.A.); 129247 A.C./2 B. H. Patman (45th Balloon Sec.); 36344 Flt.-Serjt. P. F. Renwick (14th Balloon Co.); 13345 L.A.C. (actg. Cpl.) H. Saunders (17th Squadron); 11081 Serjt. R. Sutherland (7th Squadron); 20827 A.C.1 H. P. White (1st K.B. Sec.); 134872 Cpl. H. S. Wildman (7th Squadron); 53074 A.M./2 J. Wood (41st Squadron); 54048 A.C.2 H. W. Youngs (Balloon Sec.), 404221 A.M.2 G. I. Tracey (Wireless Sec.) (Mesopotamia).

WAR OFFICE, July 15th

REGULAR FORCES.—OVERSEAS FORCES.—CANADA.—Brit. Columbia R.—Temp. Lt. (actg. Capt.) R. I. Van-der-Byl ceases to be secd for duty with the R.A.F., June 23rd.

Can. Art.—The following temp. Lts cease to be secd. for duty with the R.A.F.—R. H. Luxton, A. H. Hinton, June 27th.

Brit. Col. R.—The following temp. Lts. cease to be secd. for duty with R.A.F. :—O. A. Rowan, March 27th; A. Grundy, June 27th.
Corps Can. Rly. Troops.—Temp. Lt. W. J. Hough ceases to be secd. for duty with R.A.F., June 27th

WAR OFFICE, July 16th.

REGULAR FORCES.—Infantry.—Service Battalions.—Shrops. L.I.—Temp. Lt. E. G. Rumfitt resigns his commn on appt. to R.A.F., May 8th, 1918.

* * *

OFFICIAL COMMUNIQUÉ.

The following communiqué was issued at Simla on July 19th :—
Sniping and minor attacks occurred in the vicinity of Ali Masjid (south of the Khyber). Our aeroplanes bombed hostile gatherings at Chora.

* * *

A Bolshevist wireless message recently stated that a British aeroplane had been obliged to land in consequence of engine failure near the Northern Dvina. The crew of three aviators was taken prisoner.

* * *

The final assault of the Kuban Cossacks upon the fortress town of Tsaritsyn was assisted by aeroplanes and tanks.

* * *

On July 18th Mr. Churchill, Secretary of State for War, had a narrow escape in an aeroplane accident near Croydon. The pilot was badly injured and Mr. Churchill was severely shaken.

* * *

It is now believed that the cutting of telegraph wires between Midleton and Youghal on the night of July 19th was part of a well-planned but unsuccessful scheme to raid the military aerodrome near Killeagh.

On the morning of July 20th motor-cars full of men were seen passing through neighbouring villages, and four motor-cars stolen from city garages during the night of the 19th have since been found abandoned on roads in various parts of the country, while a fifth bearing a Waterford registration mark was also discovered on the roadside some miles from Killeagh.

The damage to the wires is estimated at £100

AIR FORCE.

FROM THE "LONDON GAZETTE."

AIR MINISTRY, July 15th.

The King has been pleased to approve of the following awards of the Distinguished Flying Cross, conferred by the General Officer Commanding the British Army in Mesopotamia :—

THE DISTINGUISHED FLYING CROSS.

Capt. J. S. BEATTY, 72nd Squadron.—During the operations near Sheroat, Oct. 24th to 30th, 1918, he rendered gallant service in harassing the enemy by machine-gun fire from very low altitudes, being vigorously fired upon the whole time. Capt. Beatty has always been conspicuous for gallantry and devotion to duty. On April 21st, 1918, he destroyed one enemy machine and brought down another out of control.

Lt. S. BULL, 30th Squadron.—Whilst engaged in bombing and machine-gunning hostile tribesmen at Khan, near Bushire, on March 6th, 1919, he saw that a brother officer had been shot down. Hoping that he might be alive, he attempted to land on absolutely unsafe ground at very close range fire from the enemy, but after touching the ground 12 yards from the crashed machine he saw at once that no hope could be entertained that the occupant was alive, by reason of the condition of the wreck, and he was accordingly compelled to abandon further action. The attempt at rescue involved much risk, as had he actually landed it is improbable that he would have been able to take off again, apart from the attention which the tribesmen would have given him at that time.

Capt. F. NUTTALL, M.C., 30th Squadron.—A gallant flight leader who has rendered valuable services in carrying out the most arduous duties in action, and has commanded his flight with great skill under exceptionally difficult conditions. On April 27th, 1918, near, Kirkuk, whilst engaged in attacking enemy troops from a low altitude, he was shot down, wounded.

Lt. M. S. MACKAY, 72nd Squadron, and Lt. R. P. POPE, 72nd Squadron (E. Surr. R.).—During the operations in Baku between August 25th and September 13th, 1918, they flew continuously over the enemy's positions, bombing and machine-gunning from low altitudes with great effect, in the face of very vigorous fire from the enemy throughout the whole period.

FOREIGN DECORATIONS.

The King has granted unrestricted permission for the wearing of the following decorations, conferred on the officers and other ranks indicated for valuable services rendered in connection with the war :—

CONFERRED BY THE PRESIDENT OF THE UNITED STATES.

AMERICAN DISTINGUISHED SERVICE MEDAL.

Maj.-Gen. Sir H. M. Trenchard, K.C.B., D.S.O. (R. Sc. Fus.).
Maj.-Gen. Sir J. M. Salmond, K.C.B., C.M.G., C.V.O., D.S.O. (R. Lanc. R.).
Maj.-Gen. Sir F. H. Sykes, K.C.B., C.M.G. (15th Hussars)
Lt.-Col. P. H. L. Playfair, M.C. (R.A.).
Maj. (actg. Lt.-Col.) E. R. Peal, O.B.E., D.S.C.
Maj. D. V. J. Blake (Aust. F. Corps).
The Rt. Hon. Lord Weir of Eastwood, P.C., late Secretary of State for the Royal Air Force.

CONFERRED BY THE PRESIDENT OF THE FRENCH REPUBLIC.

CROIX D'OFFICIER, LÉGION D'HONNEUR.

Maj. (actg. Lt.-Col.) E. R. Peal, O.B.E., D.S.C.
Lt.-Col. (actg. Brig.-Gen.) J. G. Weir, C.M.G., C.B.E. (R.A., T.F.).

CROIX DE CHEVALIER, LÉGION D'HONNEUR.

Capt. (actg. Maj. R. Addenbrooke-Prout, O.B.E., M.C.
Maj. F. C. Baker, D.F.C., A.F.C. (D.C.L.I.), 102nd Squadron.
Lt.-Col. A. V. Bettington, C.M.G.
Maj. B. L. Huskisson, D.S.C.
Maj. G. H. Loxley.
Lt. (actg. Capt.) D. R. MacLaren, D.S.O., M.C., D.F.C. (46th Squadron).
Lt.-Col. H. A. Van Ryneveld, D.S.O., M.C.

CROIX DE GUERRE AVEC PALME (FRENCH).

Lt. (actg. Capt.) W. G. Albu (N. Russia); Lt (actg Capt.) O. M. Baldwin, D.F.C. (9th Brig., France); Lt. A. M. Bannatyne (206th Squadron, France).
Lt. (actg. Capt.) G. L. Graham, D.F.C. (9th Brig., France); Lt. (actg. Capt.) W. B. Green, D.F.C. (9th Brig., France).
Maj. S. G. Hodges, M.C., A.F.C. (Wilts, Salonika); Col. (actg. Brig.-Gen.) R. E. T. Hogg., C.M.G. C.I.E. (I.A., France); Maj. (actg. Lt.-Col.) A. V. Holt, D.S.O. (Roy. Hs., France); Maj. B. L. Huskisson, D.S.C. (France).
Sec. Lt. (Obsr.) J. McDonnell (North Russia); Lt. (actg. Capt.) D. R. MacLaren, D.S.O., M.C., R.F.C. (France); Lt. H. A. Miller (North Russia); Sec. Lt. H. J. Miles (100th Squadron, France); Lt.-Col. R. P. Mills, M.C., A.F.C. (Roy. F's, France).
Sec. Lt. (Obsr.) N. D. Nunan (North Russia).
Capt. R. A. Preeston (France).
Sec. Lt. E. C. M. Reid (North Russia).
Lt. (actg. Capt.) E. J. Salter (9th Brig., France)
Lt. H. W. Tait, D.F.C. (11th Bal. Sec., France); Sec. Lt. F. F. Tattam (North Russia).
Capt. H. W. Woollett, D.S.O., M.C. (Linc. R., France).
64052 A./M.2 V. R. Bates (16th Bal. Sec., France); 2249 S./Mech. H. W. Bush (98th Squadron, France), 23964 A.M.1 W. Lambert (11th Bal. Sec., France); 140801 Serjt.-Mech. E. R. MacDonald (98th Squadron, France); 15399 Serjt. S. B. Percival (Manc. R.) (attd. 27th Squadron, France) (killed Aug. 14th, 1918); 25013 Serjt. L. C. Ovens (103rd Squadron, France); 224398 Pte. C. H. Taylor (97th Squadron, France)

THE MEDAILLE D'HONNEUR.

41300 A./M.2 G. K. Balls (56th Squadron) (en bronze); 42624 A./M.1 A. Cook (31st Bal. Sec.) (en bronze); 44463 A./M.3 C. Dickenson (100th Squadron) (en bronze); 1888 Ch. M./M. F. L. Dorber (2nd A.S.D.) (en vermeil); 1749 Ch. Mech. F. Francis (3rd R.L.P.) (en argent); 5888 Ch. Mech. C. M. Hayden (100th Squadron) (en argent); 3959 A./M.1 L. E. Hodges (12th Squadron) (en bronze); 8089 Ch. M./M. W. P. McElwee, (1A./D.) (en argent); 18305 Flt.-Clk. T. H. Phelps (2A./D.) (en argent); 13769 A./M.1 E. L. Porter (10th Squadron) (en bronze); 24255 A./M.1 J. Saltzberg (1A.S.D.) (en bronze), 37581 A./M.3 W. S. Taylor (55th Squadron) (en bronze); 26570 Cpl. F. Timms (2A./D.) (en bronze); 23000 Clk./1 H. J. Walters (1A./D.) (en bronze).

Lt.-Col. (actg. Brig.-Gen.) C. G. Hoare, C.M.G. (Maj., Ind. Army), relinquishes his commn. on ceasing to be empld., April 24th.

Temp. Hon. Lt. H. Pearse relinquishes his commn. on ceasing to be empld., June 16th.

Transferred to the unempld. list:—Sec. Lt. T. W. Sands, April 2nd; Capt. G. H. L. Sweet, from (S.O.), May 5th; Lt. (Hon. Capt.) L. Pell-Ilderton, from (S.O.), May 12th; Capt. O. A. Butcher, D.S.C., from (S.O.), June 5th; Maj. F. B Burton, from (S.O.), June 7th.

Capt. (actg. Maj.) P. Le G. Gribble relinquishes his commn. on account of ill-health, and is granted the rank of Maj., April 19th.

Capt. Hon. R. G. Lord St. Oswald (Capt., C. Gds.) resigns his commn. and is permitted to retain his rank, July 16th.

Lt. A. Graham relinquishes his commn. on account of ill-health, and is granted the rank of Capt., July 7th.

The notifications in "Gazette" of June 17th concerning the following Officers are cancelled:—Capt. W. G. Scott, Lt. F. T. Chapman, Lt. R. Tait, Lt. G. B. Redgrave, Lt. A. R. Harris, Lt. F. V. Bell, Sec. Lt. A. E. H. Hales.

The notification in "Gazette" of June 6th concerning P.F.O. J. W. D Archibald is cancelled.

The notification in "Gazette" of June 13th concerning Maj. R. E. Childers, D.S.C., is cancelled.

AIR MINISTRY, July 18th

The King has been pleased to approve of the award of the Victoria Cross to the late Captain (actg. Major) Edward Mannock, D.S.O., M.C., 85th Squadron Royal Air Force, in recognition of bravery of the first order in aerial combat.

On June 17th, 1918, he attacked a Halberstadt machine near Armentières, and destroyed it from a height of 8,000 feet.

On July 7th, 1918, near Doulieu, he attacked and destroyed one Fokker (red-bodied) machine, which went vertically into the ground from a height of 1,500 feet. Shortly afterwards he ascended 1,000 feet and attacked another Fokker biplane, firing 60 rounds into it, which produced an immediate spin, resulting, it is believed, in a crash.

On July 14th, 1918, near Merville, he attacked and crashed a Fokker from 7,000 feet, and brought a two-seater down damaged.

On July 19th, 1918, near Merville, he fired 80 rounds into an Albatross two-seater, which went to the ground in flames.

On July 20th, 1918, east of La Bassée, he attacked and crashed an enemy two-seater from a height of 10,000 feet. About an hour afterwards he attacked at 8,000 feet a Fokker biplane near Steenwercke, and drove it down out of control emitting smoke.

On July 22nd, 1918, near Armentières, he destroyed an enemy triplane from a height of 10,000 feet.

Major Mannock was awarded the following distinctions for his previous combats in France and Flanders:—Military Cross (Gazetted, Sept. 17th, 1917); Bar to Military Cross (Gazetted Oct. 18th, 1917); Distinguished Service Order (Gazetted Sept. 16th, 1918); Bar to Distinguished Service Order (1st) (Gazetted Sept. 16th, 1918); Bar to Distinguished Service Order (2nd) (Gazetted Aug. 3rd, 1918).

This highly distinguished officer, during the whole of his career in the Royal Air Force, was an outstanding example of fearless courage, remarkable skill, devotion to duty, and self-sacrifice, which has never been surpassed.

The total number of machines definitely accounted for by Major Mannock up to the date of his death in France, July 26th, 1918, is 50—the total specified in the "Gazette" of August 3rd, 1918, was incorrectly given as 48, instead of 41.

THE PAY OF THE ROYAL AIR FORCE.

The following official statement with reference to the revised rates of pay for officers of the Royal Air Force was issued on July 21st.

1. The rates of pay, pensions, and allowances for officers of the Royal Air Force have been under review, and the standard rates now authorised are as shown in the accompanying statements. The present system, under which the various branches each had their own rates of pay, has been replaced by a uniform system of rates for all branches, with the exception that certain specialist services (such as medical and dental) will continue to have special rates as hitherto. These specialist services will be dealt with separately, except in so far as reference is made to them below.

2. The rates have been fixed with reference to the present high cost of living, and it has been decided that 20 per cent. of the rates of pay and retired pay will be considered as due to the present high cost of living, and will be subject after five years to change, either upwards or downwards, according as the cost of living rises or falls. Subsequent revisions will be made at three-yearly intervals on the basis of Board of Trade food prices.

3. The new rates will not apply to officers awaiting demobilisation or who are temporarily retained. They are intended for those officers who are given permanent or short-service commissions in the force as reconstituted, or who are seconded to the Royal Air Force from the other Services.

PAY.

The rates will be as follows, and will apply generally to officers (including staff officers) performing duties of the present Flying, Technical, and Administrative branches:—

Rank.	Pay per diem. £ s. d.
Cadet	0 5 0
Cadet after 1 year	0 10 0
Second Lieutenant	0 18 0
Lieutenant	1 3 0
Lieutenant after 2 years as such	1 5 0
Captain	1 9 0
Major	1 14 0
Major after 5 years as such	1 16 0
Lieutenant-Colonel	2 0 0
(Rising by 1s. per day after each year to a limit of £2 10s.)	
Colonel	2 15 0
Colonel after 2 years as such	2 18 0
Colonel after 4 years as such	3 1 0
Colonel after 6 years as such	3 4 0
Brigadier-General	3 4 6
Brigadier-General, Command Pay	0 5 0
Major-General	5 0 0
Lieutenant-General	6 0 0
General	7 0 0

SPECIAL RATES FOR QUARTERMASTERS.

	Rank.	Pay per diem. £ s. d.
On appointment	Lieutenant	0 19 0
After 4 years	"	1 1 0
" 8 "	Captain	1 3 0
" 12 "	"	1 5 0
" 15 "	Major	1 10 0
	Lieutenant-Colonel	1 15 0

(The establishment of Lieutenant-Colonels will be a very small one.)

SPECIAL RATES FOR CHAPLAINS.

	Rate per diem.
On entry	1 0 0
After 3 years	1 3 0
After 6 years	1 6 0
After 9 years	1 9 0
After 12 years	1 12 0
After 15 years	1 15 0
After 18 years	1 18 0
After 21 years	2 1 0
After 24 years	2 4 0
After 27 years	2 7 0
After 30 years	2 10 0
Chaplain-in-Chief	£1,000 per annum.

Temporary Chaplains in the Royal Air Force will receive a gratuity of £50 for each complete year of service, subject to conditions to be hereafter published.

Medical officers will receive the same rates of pay as may be approved for the Medical Service of the Army.

PAY OF OFFICERS EMPLOYED AT THE AIR MINISTRY.

RATE.

DIRECTORS, £2,000 per annum
DEPUTY DIRECTORS, 1st Class, £1,500 per annum
DEPUTY DIRECTORS, 2nd Class, £1,200 per annum
} Consolidated rates.

OTHER OFFICERS.—Down to and including the rank of Major.—Full pay and allowances, *plus* £100 per annum. Below the rank of Major.—Full pay and allowances, *plus* £75 per annum.

ATTACHED OFFICERS.—Full pay and allowances of their rank, *plus* 10s. a day up to three months; thereafter they will come on to the ordinary Air Ministry Scale.

ALLOWANCES.

The allowances will be as given below, and will be reviewed periodically:—

TABLE MONEY.—Is under consideration.

SUBSISTENCE AND TRAVELLING ALLOWANCES.

	Up to 8 nights in one place.	After 8 nights.	Daily absence 5-9 hours.	Daily absence over 9 hours.
	s. d.	s. d.	s. d.	s. d.
A. Rank of Col. (or similar staff grading) and upwards	30 0	15 0	6 0	15 0
B. Below rank of Col.	22 6	12 6	4 0	11 6

LODGING, FUEL, LIGHT, AND RATION ALLOWANCES.

HOME STATIONS.—The standard rates will be as follows:—

	Lodging.	Fuel and Light. (average)	Rations.
	Per diem.	Per diem.	Per diem.
2nd Lts. and Lts. ..	3s. 6d.	1s. 0d.	No change
Capt., Maj. and Lt.-Col.	4s. 6d	2s. 0d.	No change
Other Officers	No change	Increase of 1s. per diem.	No change

NOTE.—Married officers over 30 years of age for whom no married quarters are available and who are therefore obliged to provide accommodation for themselves and for their families may draw lodging, fuel, and light allowances.

SERVANTS' ALLOWANCE.—2s. for each authorised servant at home and abroad if no servant is provided.

FIELD ALLOWANCE.—To be granted to all officers on active service in the field, and to be issuable whenever officers are under canvas. The rate is still under consideration.

CHILDREN'S ALLOWANCE.—Existing rates of children's allowance will continue until the end of 1919, after which they will be abolished. In the meantime children's allowance will be continued, and officers now receiving the allowance will not become ineligible for it if the effect of the increases in pay now granted is to raise their salaries beyond the limit of income laid down for the grant of the allowance.

COLONIAL ALLOWANCE.—The same as for the Army.

CONVEYANCE OF FAMILIES.—The cost of conveying the wives, families, and baggage of officers will be charged to the public only in respect of changes of station in this country.

FURNITURE ALLOWANCE AND CHARGES.—Furniture allowance and furniture charges are abolished. In future, all quarters, including the commanding officer's quarters, will be furnished.

MESS ALLOWANCE.—This allowance is abolished.

TRAVELLING CONCESSIONS.—The question of the continuation (*a*) of the rule allowing officers proceeding on leave two free passes a year, (*b*) of the reduced fare for officers travelling on leave, is still under consideration.

PENSIONS.

(Applicable to officers performing duties of the present Flying, Technical, and Administrative Branches.)

A.—GENERAL OFFICERS.

Lieutenant-General.—£975 after 24 years' service, increased by £22 for each year beyond 24, with a maximum of £1,195.

Major-General.—£790 after 22 years' service, increased by £22 for each year beyond 22, with a maximum of £1,010.

Brigadier-General.—£650 after 20 years' service, increased by £22 for each year beyond 20, with a maximum of £950.

An officer must complete three years' service in any of these ranks before being entitled to the special pension attaching to it. This condition will not, of course, affect his title to the pension earned by service in the ordinary way, and an officer may reckon service as lieutenant-general or major-general towards his service in a lower rank if that would entitle him to special pension for that lower rank.

B.—COLONELS AND LOWER RANKS.

There will be a minimum qualifying period for pensions—20 years.

Subject to this the scale is as follows:—

	Age	Retired Pay.	Service.	Addition for each extra year of service.*	Reduct'n for each deficient year of service.*
Cols. retire at 55, max. ret. pay £900	55	£790	24	22	15
	54	765	24	22	15
	53	742	23	22	15
	52	720	23	22	15
Lt.-Cols. retire at 48, max. ret. pay £600	51	697	22	22	15
	50	675	22	15	15
	49	637	21	15	15
	48	600	21	15	15
Majs. retire at 45, max. ret. pay £450	47	562	20	15	15
	46	525	20	15	15
	45	487	19	15	15
	44	450	19	15	15
Capts and subalterns ret. at 40, max. ret. pay £400	43	412	18	15	15
	42	375	18	15	15
	41	337	17	15	15
	40	300	17	15	15

* Limited to 5 years.

Gratuities to officers who retire before qualifying by length of service for Service pensions:—

A gratuity of £75 for each completed year of service will be awarded, with a maximum of £1,000, provided that no officer is to be allowed to resign with a gratuity unless he has completed 10 years' service.

While these pension scales will be applicable generally to officers appointed to perform the duties of the present Flying, Technical, and Administrative branches, including chaplains, the following will be dealt with under special regulations which will shortly be issued:—

Officers seconded from the Navy and Army. Officers who may be appointed as Quartermasters on the special Quartermasters' rates of pay.

Commissioned Warrant Officers, Warrant Officers, and Ratings from the Royal Navy on regular engagements who have been given temporary commissions in the R.A.F.

Warrant Officers, N.C.Os. and Men from the Army on regular engagements who have been given commissions in the Army or were given temporary commissions in the R.A.F.

It should also be noted that these scales do not apply to specialist services such as Medical and Dental officers, Pay officers, and Schoolmasters.

NOTES.

1. The application of these standard rates of pay, pensions, and allowances to the existing and future personnel will be carried out under administrative regulations which will shortly be published.

2. The new rates will begin to take effect from the date of the first "Gazette" containing the names of officers appointed to permanent and short service commissions in the Royal Air Force. They may begin at somewhat later dates for officers not dealt with in the first "Gazette."

THE PEACE PROCESSION.

On July 19th, the Peace Procession through London took place. Detachments of the Royal Navy, Army and R.A.F. took part. Detachments from the various foreign Powers were also present.

The following formed the R.A.F. contingent:—

Major-General Sir J. M. Salmond, K.C.B., C.M.G., C.V.O., D.S.O. Brig.-Gen. C. L. Lambe, C.B., C.M.G., D.S.O. Col. C. R. Samson, C.M.G., D.S.O., A.F.C. Brig.-Gen. C. A. Longcroft, C.M.G., D.S.O., A.F.C. Brig.-Gen. E. Maitland, C.M.G., D.S.O.

REPRESENTATIVE DETACHMENTS.

Lieut.-Colonel C. L. N. Newall, C.M.G., R.N., and Staff.

Representative Detachments of the following:—No. 5 Squadron; No. 7 Squadron; No. 9 Squadron; No. 11 Squadron; No. 12 Squadron; No. 18 Squadron; No. 22 Squadron; No. 25 Squadron; No. 29 Squadron; No. 43 Squadron; No. 57 Squadron; No. 59 Squadron; No. 62 Squadron; No. 70 Squadron; No. 84 Squadron; No. 88 Squadron; No. 92 Squadron; No. 110 Squadron; No. 208 Squadron.

PARKS AND DEPOTS.

Airships; South-Eastern Area; South-Western Area; Midland Area; Northern Area; 29th Group; 11th Group.

CHAPLAINS AND MEDICAL SERVICES.

WOMEN'S ROYAL AIR FORCE.

Pilots and crack squadrons were poorly represented.

VACANCIES FOR R.A.F. DOCTORS.

The Air Ministry announces that the Royal Air Force requires the services of a limited number of medical practitioners, including those who have already served. All candidates must be fit for general service at home and abroad, should be under 35 years of age, and must be willing to fly if called upon to do so.

The terms of service are as follows:—

Candidates who have served before will be commissioned in their previous substantive rank; those who have not served will be commissioned as lieutenant.

The period for engagement to be for one year or until no longer required, whichever shall first happen.

Pay to be at the rate of £550 a year, inclusive of all allowances, except travelling allowances and expenses when travelling on duty, and rations or the allowance in lieu.

Outfit and kit allowance will be issued to candidates who have not received them for previous service.

Applications should be addressed to the Secretary, Medical Department, Air Ministry, London, W.C.2.

THE REMOVAL OF THE AIR MINISTRY.

The Air Ministry is being removed as quickly as possible from its present home at the Hotel Cecil to three adjoining buildings in Kingsway—Empire House, India House, Canada House. On and after Wednesday, July 23rd, therefore, all communications should be addressed to the Air Ministry, Kingsway, W.C.2.

The official entrance to the Ministry will be in Empire House, but letters and parcels should be delivered at the Canada House entrance.

AIR MINISTRY ANNOUNCEMENTS.

The Air Ministry calls the attention of all persons who have served, but are no longer serving in the Royal Air Force, the Royal Naval Air Service, and the Royal Flying Corps, or who have been employed either directly or indirectly, by the Government in research or experimental work in connection with flying, or engaged in the manufacture of aircraft, or parts, or accessories of aircraft, to the fact that no information obtained through secret and confidential service publications or technical apparatus, or in any other manner consequent upon their employment by the Government, as above mentioned, may be disclosed to any other person without the written consent of the Air Ministry.

Disclosure of information so obtained may constitute an offence under the Official Secrets Act, and attention is directed to the obligations and penalties imposed by that Act.

* * *

The Air Ministry made the following announcement on July 17th :—

It is notified for general information that the Investiture for the presentation of Distinguished Flying Crosses and Air Force Crosses to Officers of the Royal Air Force will be held at Buckingham Palace on Thursday, 24th instant. There will be no Investiture on the 19th instant, but Officers who have applied already, and are not summoned for the 24th instant, will receive orders to attend later from the Lord Chamberlain's Office, as numbers and occasions permit.

It is particularly important that Officers should understand that they cannot be allowed to present themselves for Investiture unless they receive a summons to attend from the Lord Chamberlain's Department. It will be realised that it will not be possible for attendance to be ordered for 24th instant for all who have applied, and Officers who do not receive instructions to attend on that date will understand that their names remain noted for another occasion, and that no further action is required of them. It is not practicable to indicate beforehand when Investitures will be held at which any individual will receive his decoration.

There are now sufficient applications in hand to occupy a considerable time, and no further names are, therefore, required until about Sept. 1st, 1919.

Service Dress should be worn by Serving Officers and by Officers demobilised or released from service if so desired—otherwise Morning Dress (frock coat or morning coat) should be used.

Investitures for the Order of the British Empire will be arranged next October, and applications for attendance may be submitted to the Air Ministry at any time after Oct. 1st, 1919.

* * *

The Air Ministry announced on July 17th :—

His Majesty the King has been graciously pleased to signify his pleasure that a medal be granted to record the bringing of the war to a successful conclusion, and the arduous services rendered by His Majesty's Forces.

2. The medal in silver will, provided the claims are approved by the competent Royal Air Force authorities, be granted to the under-mentioned classes who either entered a theatre of war on duty or who left their places of residence and rendered approved service overseas, other than the waters dividing the different parts of the United Kingdom, between August 5th, 1914, and Nov. 11th, 1918, both dates inclusive :—

(a) Officers, warrant officers, attested and enrolled non-commissioned officers and men of the Royal Naval Air Service, Royal Flying Corps, or Royal Air Service.
(b) Members of women formations employed under a direct contract of service with the Royal Air Force Medical Service.
(c) All who served on staffs of Royal Air Force hospitals and all members of recognised organisations who actually handled sick and wounded.
(d) Members of duly recognised or authorised organisations.

3. The medal will also be granted to all officers, warrant officers, attested and enrolled non-commissioned officers and men of the Royal Naval Air Service, Royal Flying Corps, and Royal Air Force, who—

(i.) Have been actively engaged in the air against the enemy whilst borne on the strength of an operational unit in Great Britain.
(ii.) Have been employed in flying new aircraft to France.
(iii.) Have formed part of the complement of an aircraft-carrying ship.

4. The medal in bronze will be granted to all British subjects who were enrolled as followers or members of Native Labour Corps units and who served in theatres of war.

5. The riband will be : centre orange, watered, with stripes of white and black on each side and with borders of royal blue.

6. Instructions as to the submission of claims and the disposal of the medals will be issued in due course.

* * *

The Air Ministry made the following announcement on July 19th :—

The gallantry of a German prisoner of war in this country, who rescued one of our flying officers from being burned alive, has procured him release from his prison camp forthwith, a free passage to Germany, together with a sum of money and a silver watch, in recognition of his behaviour.

A British aeroplane crashed and took fire at a Wiltshire aerodrome, where the prisoner and others are employed. The pilot was entrapped and in danger of a terrible death when the prisoner in question, Private Brückman, of the 99th Infantry Reserve Regiment of the German Army, went to the disabled officer's assistance, and effected his rescue at great personal risk to himself.

BISLEY.

The first stage of the St. George's at Bisley, at which 10 shots at 300 yards are fired, took place on July 16th. The highest score was obtained by Lieut. A. B. Lewis, R.A.F., 45 points. Capt. J. Pearce, R.A.F., got 43 points.

The following are among the King's Hundred :—

Capt. C. E. Stewart, late R.E., attd. R.F.C.; Major H. R. Northover, R.A.F.; Lieut.-Col. A. C. R. Garrod, R.A.F.; and Major W. A. D. Edwards, late R.A.F.

Major H. R. Northover, R.A.F., was second in the contest for the King's Prize at Bisley on July 18th, with 248 points, and was awarded the N.R.A. Badge and £25. Lt.-Col. A. G. R. Garrod, R.A.F., was sixth with 245 points, and was awarded the N.R.A. Badge and £5.

In the revolver team competition on July 19th, the Royal Navy was first, the Royal Marines second, the Army third, and the R.A.F. fourth. The Pixley was won by Major A. T. Whitelock, R.A.F.

Captain H.R.H. the Prince Albert, K.G., presented the prizes in the absence of H.R.H. the Prince of Wales, K.G.

FRANCE.

The following is from a Paris correspondent :—

General Haller, commanding the Polish Army, was recently given his first flight in a Breguet machine by Adjudant Sallares.

A squadron of four seaplanes belonging to the French Navy have left Toulon for Cette. Two alighted in the harbour at Berre and two others in that of Carro.

Lieut. Franval, on a 120 m.p. Morane, has left for Pampeluna to give an exhibition. He intends to stop at Cazaux and Angoulême. Later he will give an exhibition before the King of Spain at Santander.

Military biplanes, new, complete with 120-130 h.p. engines, are being sold to private enterprises for the price of a Ford car.

Mention was recently made of various flights that were to be carried out under the auspices of the French Aviation Authorities, and a list of routes, pilots, and machines selected was given. These flights have been further divided into two categories—sporting and scientific.

The sporting flights are :—

Comdt. Vuillemin and Lieut. Dagnaux (Breguet), Paris-Constantinople-Cairo, by Naples and Salonika; Capt. Lafon (S.E.A.), Paris-Constantinople, by Venice and Belgrade; Lt. Bouzac (Spad-Herbemont), Paris-Fez; Lt. Patauchon (Breguet), Paris-Casablanca; Lt. Lemaitre (Breguet), Paris-Dakar; Lt. de Romanet (S.E.A.), Paris-Rome; Lt. Flachaire (S.E.A.), Paris-Amsterdam; Lt. Marinovitch (S.E.A.), Paris-Venice-Prague; Lt. Fonck (Nieuport), Paris-Madrid.

On the scientific side there will be trials of navigation by compass and radiogonometry by Capt. Lejeune (Paris-Constantinople), Sergt. Jaouen (Paris-Tunis-Casablanca-Paris), and Capt. Hebrard (Paris-Toulon).—F. T. N.

U.S.A.

On June 20th the U.S. Senate Naval Affairs Committee voted 35 million dollars for Naval aviation during the coming year.

* * *

The visit of H.B.M.A. R.34 to the United States has had the effect of arousing American interest in the big airship.

Admiral Benson, Chief of the U.S. Naval Operations, announced on July 14th that Congress had authorised the construction of large hangars and the construction or purchase of two large airships. He also stated that at first the airships will be used for experimental purposes.

* * *

The U.S. House Military Affairs Committee during the end of June increased the appropriation for the U.S. Army Aviation Service to 55,500,000 dollars.

Special provision in the new Army Bill allows $982,000 for the purchase of the Curtiss-Ellwood aviation plant at Buffalo, $1,260,000 for the purchase of the Dayton-Wright aeroplane plant at Dayton, $3,500,000 for the purchase of the airship landing-ground and sheds in Burlington County, N.J., and $470,000 for the aerodrome at Rockwell Field, San Diego, Cal.

* * *

The Air Service of the United States War Department are retaining permanently 26 aerodromes. Fourteen will be retained temporarily for storage and other purposes, and none will be abandoned or sold at present.

JULY 30, 1919.

Subscription Rates, post free: Home, 3 months, 7s. 6d.; 6 months, 15s.; 12 months, 30s.
Foreign, 3 months, 8s. 9d.; 6 months, 17s. 6d.; 12 months, 35s. Canada, 1 Year, $8.
U.S.A., 1 Year, $8.50c.

ON INTERNATIONAL AIR NAVIGATION AND CIVIL AVIATION.

On July 24th the Air Ministry issued the text of "The International Convention for the Regulation of International Air Navigation," as agreed "by the representatives of the Allied and Associated Powers serving on the International Commission dealing with aerial navigation and appointed as a sub-Commission of the Peace Conference."

It is stated that "the Convention has been agreed to by all the representatives, subject to certain reservations. The Convention has not been formally approved by the Supreme Council of the Peace Conference. It has, however, been agreed that it should be issued for the information of the public of the Allied and Associated States."

Hitherto it has been the custom of this paper to publish the text of all important official documents for the benefit of its readers. In this case it is impossible to do so, for the convention covers 43 pages, each somewhat larger than a page of THE AEROPLANE. Therefore one can only quote important points in the document and comment thereon.

The official "white paper" containing the full text can be had for ninepence from any bookseller, or for a shilling post free from the Publishing Department of THE AEROPLANE, 61, Carey Street, W.C.2. It should be unnecessary to say—but knowing the carelessness of aviators one does so none the less—that everybody who has to do with Civil Aviation ought to have a copy of this document, for on the understanding and observation of its provisions depends the smooth running of all future aerial traffic outside this country.

It cannot be too widely known that ignorance of the law is no defence against prosecution for breaking it. Therefore every pilot who hopes for a job in civil aviation, every ground engineer who hopes for a job with a civil aerial transport firm, every owner or prospective owner of an aeroplane who hopes to fly abroad, and in fact everybody in any way concerned with the flying, equipment, management, or sale of commercial aircraft ought to be thoroughly well educated in the contents of this all-important document before they venture on any international work.

A MATTER OF LIFE OR DEATH.

It ought to be fairly plain to anybody with moderate intelligence that the whole future of aviation, the whole life of the Aircraft Industry, and, as a corollary, the efficiency of our Flying Services in the next war, depends on International Air Navigation. If we develop our international air navigation in an intelligent and enterprising way we shall become the world's leading Air Power. If we are content to fiddle around with "joy-rides" and "exhibition stunts" in our own country for the next few years, then we can say "Good-bye" to Air Power and sink again into the fourth-rate position which we held before the recent war.

America will acquire our foreign trade in commercial aircraft just as she acquired the world's motor trade through the self-sufficiency, lethargy, obtuseness, and conceit of British motor makers. Germany will acquire the world's trade in war machines just as she acquired the world's trade in guns, small-arms, and ammunition before the war.

It is true that Germany is forbidden by the Peace Treaty to make war aircraft, but the German is much too clever to be defeated by such a clause in a treaty. A high-speed racing aeroplane or a specially designed acrobatic machine only needs a gun or two and it becomes forthwith a first-class fighting machine. And just as sawing the forward gunner's cockpit off a big bomber makes it into a perfectly peaceful passenger machine (*vide* certain illustrations in this paper), so sticking a projecting nose onto a passenger machine will make it a self-protecting bomber.

Remember how, when Napoleon decreed that Prussia should only have an Army of 20,000 men, the Prussians introduced the short-service system and put 100,000 men through their Army in a few years. Germany will do something very similar in the matter of aircraft.—And we shall be mighty glad of it in years to come, when the real race-war against the Slavs comes upon us.—But meantime Germany will be capturing our foreign trade in aircraft.

Therefore it is a matter of life and death to the British Aircraft Industry whether we get going on International Air Navigation before our competitors or not. And precisely when we get going depends very largely, if not entirely, on the Air Ministry, and more particularly on the Department of Civil Aviation.

DEPARTMENTAL HINDRANCES.

So far, we have no reason to be pleased with the work of our Civil Aviation officials. One is prepared to make every allowance for Sir Frederick Sykes, Controller-General of Civil Aviation, for he has been up against many difficult problems. In the early days of his Department most of his time had to be spent in Paris debating this very Convention which is now under discussion. Also, he had no staff with which to carry on the work of his Department in his absence.

Being a singularly far-sighted man, he, no doubt, decided that the ultimate good of Civil Aviation would be better served by influencing the International Conference in the right direction than by stopping at home and confining his energies to regulating joy-rides and exhibitions. Wherein he was absolutely right. But while he has been away the mice at home have been not so much playing as gnawing at the roots of our Aircraft Industry.

When most of the work of the International Conference was done General Sykes had a bad smash at Kenley, and that must have hindered his work still further. And since he has recovered and has been trying to build up a staff for his Department it seems that he has had

foisted upon him just about the most useless set of individuals who have ever been collected into a Government office.

It is only fair to say that General Sykes's Department is not always directly to blame for the hindrances which have been placed in the way of civilian flying. But it is certainly indirectly to blame, for its duty is to develop civil aviation, not merely to control it. And a very important part of that duty should consist in removing hindrances which are raised by other Departments in the Air Ministry. The Department of Civil Aviation should be, in fact, a kind of foster-mother which should take up the defence of any civil aviation venture which was being put-upon by other Departments.

A Case in Point.

Take for example the case of the machines and engines which certain firms in the Aircraft Industry were forbidden to use in the Aerial Derby, just when British aeroplanes needed a big International advertisement as an off-set to the fine performances put up by our friends in France and Italy. The reasons given by the Supply Department, which seems to have been the Department which prohibited the use of these machines, were so utterly futile that they could hardly have deceived even a Member of Parliament or a daily journalist. It should have been the duty of the Civil Aviation Department to defeat the Supply Department and to have obtained permission for the machines to fly. Yet the Civil Aviation officials did nothing to help.

Everything good that was done during the war was only done by one Department defeating another, and it was commonly said that the war on the Bolo Sector of the Strand Front was the bitterest of any. So in civilian flying, success will only be attained if the Civil Aviation Department makes up its mind to defeat all the other Departments.

A Public Scandal.

Take another example. The Supply Department, in an effort to achieve economy, doubtless praiseworthy though it may lead to a particularly dirty form of graft, appears to be buying in the cheapest market, regardless of quality, and in doing so seems to be going the right way to work to kill enterprise and originality, which means killing progress in Civil Aviation, and so destroying the efficiency of the equipment of the Royal Air Force.

In a very forcible letter, which under the intriguing title "Embusqué's Grab" appears on page 438 of this issue, a necessarily nameless victim of the Supply Department describes in detail how well-designed and well-made components of aircraft are practically stolen by the Department and farmed out to be made as cheaply as possible. And, in one of the strongest and most closely reasoned of the many brilliant articles which have appeared under his pseudonym, "Strasbourg" lays out, on page 413, the idiocy of the officials who practise these false economies. But one notices that he refrains from pointing out, as he might have done, that the outsider who will take on the cheap and nasty reproduction of another man's good design is quite possibly the very type of man who will bribe minor officials to influence the order in his direction and who will bribe minor inspectors to pass bad work.

Such methods of doing official business spell death and damnation to British Aeronautics and all concerned therewith. Cheap reproductions of aeroplanes, engines, fittings, or instruments mean fatal accidents in the Royal Air Force, and a bad name for British aircraft abroad. Depriving the actual designers of their just due in the way of orders and profits means putting them out of business, and so killing progress. As the advertisement of the London and Provincial Aviation Co. said, when they retired from business with their profits in their pockets instead of spending their profits on hoping for the best, "One might as well play for nothing as work for nothing."

The Handicap of a Uniform.

It is precisely when such things as this occur that the Department of Civil Aviation should step in and see that the Aircraft Industry has fair play. But apparently none of the officials in that Department have either the brains, or the pluck, or the initiative, to start out and raise a row in the interests of Civil Aviation.

Moreover, it seems that the said officials are still handicapped by being in uniform, and so cannot, even if they they had the pluck, do their duty properly. Obviously a captain or a major or a lieutenant-colonel in one Department cannot go to a General of one sort or another in a different Department, and tell him that his subordinates are either a set of amazing fools or else a crowd of crooks.

A civilian could do so, just as easily as one can oneself, though perhaps he might do it more politely. And that is what ought to be told to the Chiefs in the Supply Department. And the sooner they realise the fact the better.

The Official Rubbish Heap.

During the war one pointed out over and over again that the technical people in the Air Ministry with very few exceptions were the "throw-outs" of the Aircraft Industry and of the Motor Trade. Almost everybody who was any real good was producing aircraft, and not sitting in the Hotel Bolo.

To-day the position is obviously worse. Since the Armistice removed the immediate need for dodging trenches even those who could not get jobs in the Aircraft Industry have cleared out of the Hotel Bolo. A vast percentage of the Air Ministry "experts" have returned to their pre-war avocations as motor touts, book-makers, advertisement canvassers, and so forth. Consequently the people who are still left in the technical jobs, and have the fate of British Aeronautics in their hands, are those who are so astoundingly bad that they cannot get a job of any sort anywhere except in the Air Ministry.

There are, of course, a few exceptions, such as regular officers in the R.A.F. whose whole career is wrapped up in the King's Service, and a few enthusiasts who see that it is their duty to stay in the R.A.F. and try to make a success of its technical work. But, taking it by and large, one is fairly safe in saying that whereas the various Technical Departments during the war were merely the scrap-heap of the Aircraft Industry, they are now the rubbish-heap of all British trades. And nobody will agree more cordially with this dictum than will the few remaining good men who are condemned to work with this commercial residue.

A Crying Need.

Naturally this state of affairs cannot continue. It cannot be allowed to continue. And, above all, the people who have up to the present made such an unholy mess of commercial aeronautics within the British Isles cannot be allowed to extend their dire influence to International Air Navigation.

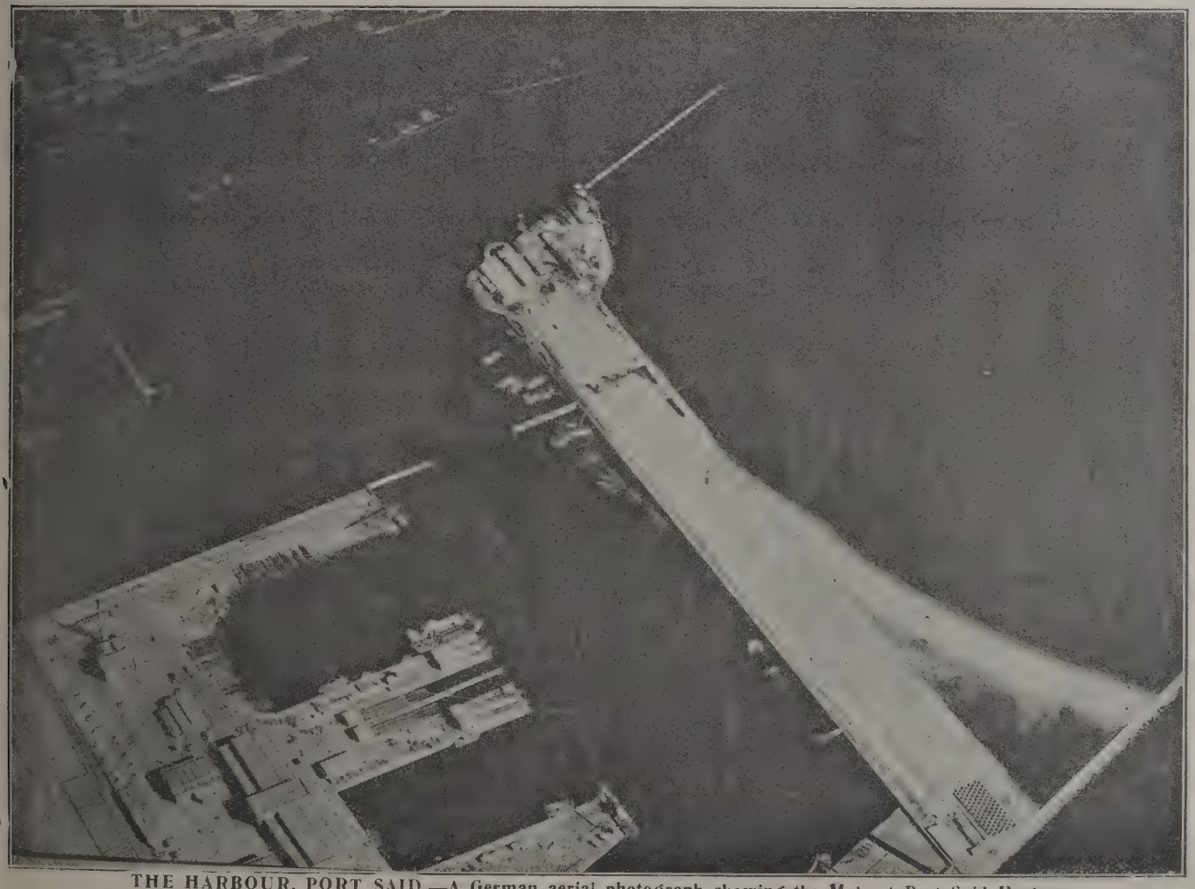
There is a crying need for drastic reform in the three Departments which affect commercial aeronautics, the Civil Aviation Department, the Supply Department, and the Aeronautical Inspection Department. The purely Military (including the Naval) side of the Air Ministry is doing very well indeed. So is the Research

Department—which, one hears, is displaying an intelligent appreciation of good work and is operating in a way which would have made a vast difference to the R.A.F. in the Field if only it had been in similarly capable hands during the war.

The Air Ministry to-day rejoices in a Department of Information under a very able officer who has already done much valuable work. One would like to suggest that perhaps the most valuable information which this Department could issue at the moment would be a complete list of all the officials in the three Departments before-mentioned, together with an account of the qualifications for his job of each of the officials in that list. One believes that the resultant document would be both entertaining and educative, as well as funny without being vulgar.

Reform Agitation.

In any case reform is needed, and reform will have to come. All reforms are preceded by agitation, as witness every reform, from Wat Tyler's Rebellion and earlier, down to the Yorkshire Coal Strike. The agitations of 1915 and early 1916 resulted in the Air Enquiry Committee of 1916 and the reforms which resulted in the R.F.C. winning the command of the air in 1917.



Something of a very similar nature seems to be afoot to-day. One hopes that it will not be necessary to hold another Air Enquiry, but if it becomes necessary it ought to be more amusing than the 1916 Enquiry, if only because the manufacturers will have no fear of losing Government orders, because at the present rate of progress they will have none to lose. Those whose Departments are at fault will do well to set their houses in order without waiting for the agitation to develop further, for thus they may hold their jobs. If they do not reform their Departments themselves they are bound to suffer accordingly, for even though they may not themselves be to blame they are none the less officially responsible for the misfeasances of their underlings.

Lack of Faith.

It is true that the Air Ministry is not alone to blame for the present state of affairs. In a particularly amusing article, on page 445 of this issue, that humorous but eminently practical writer "Medway" discourses on "Men of Little Faith," and one fears that he is only too right in his belief that some people in the Aircraft Industry themselves lack faith in the future of commercial aeronautics. Magnificent chances of securing foreign business are being lost, largely through lack of enterprise. And that lack of enterprise is simply caused by lack of faith, for those who are losing the opportunities have shown plenty of enterprise in other directions.

The Aircraft Industry must convince itself that there is money to be made out of International Air Navigation. It is no use sitting still and waiting for the money to make itself out of Government orders, and out of foreign Governments who, it is hoped, will come over here and beg us to let them buy aeroplanes.

Not long ago one was arguing with a very astute business man who was hesitating whether to spend some of his war profits on commercial aviation, One pointed out to him that if he got hold of a railway concession in, say, China he would not hesitate to spend a few millions and would not expect any return for his money for three or four years, and that he could well afford to do the same with aviation. His reply was simply that if he built a railway he would know that as soon as the railway began running he would be assured of a definite number of third-class fares and a definite amount of goods traffic.

THE HARBOUR, PORT SAID.—A German aerial photograph showing the Mole at Port Said Harbour.

The reply was ingenious, but not convincing. One holds firmly to the belief that it is possible to go out and *make* a market for civil aerial transport if one sets to work the right way. And it is just this faith which is lacking in so many who could afford to go out and make their own markets if so disposed.

The Monopoly Question.

Major C. C. Turner, in his latest article in the "Observer," raises another point which has a bearing on the present "hold-up" in commercial aeronautics, if one admits his premises. He says:—

"There is too much evidence of internal strife, which is certain to increase as the situation, owing to the lack of Government encouragement, makes it increasingly difficult for individual firms. There are some who say this situation has been brought about deliberately. There is a struggle to secure absolute control by one monopoly working side by side with the Government establishment. The movement goes so far as to include the aeronautical bodies. The Royal Aero Club is probably regarded as a nuisance, since its insistence upon the care for the sporting and private side of flying runs counter at almost every point to monopoly, State or private. The Royal Aero Club gets stronger and stronger, in spite of insidious influences and counter-mining. The Royal Aeronautical Society is, in the nature of things, easier prey.

"But the nation's best interests are too closely concerned with the maintenance of a virile industry, with room and freedom for every capable designer and for the greatest versatility and diversity of talent, for anyone who has those interests at heart to submit to influences that, working on no matter how reasonable-seeming excuses and motives, are essentially inimical to the country's welfare."

The "congealed inuendo," as Mrs. Malaprop called it, is not hard to follow. According to Major Turner, if one reads aright, some firm or other is trying to "corner" commercial aeronautics, and to queer everybody else's pitch in the process. The only question is, which firm?

Obviously one thinks of Mr. Holt Thomas's group first. The Aircraft Mfg. Co., Ltd.; Aircraft Transport and Travel, Ltd.; Airships, Ltd.; The Gnôme and Le Rhône Engine Co., Ltd.; Peter Hooker, Ltd.; and perhaps a few more of which one is ignorant, make a formidable list of producing firms. And when one considers Major-General Brancker, Brigadier-General Festing, Lieut.-Col. O'Gorman, Mr. Alfred Turner, and sundry other ex-officers and ex-officials, one perceives a galaxy of talent which might well make a successful effort to secure a monopoly of civil aerial transport.

But then again there is Sir Samuel Waring's group, the Alliance Aeroplane Co., the Bat Co., the A.B.C. Engine Co., and a few more; and a number of astute business men concerned therewith. Also there is that benevolent autocracy known as Handley Page, Ltd. And there is a little affair called Vickers, Ltd., which has a few stray Admirals, Generals, officers of lower rank, any quantity of M.Ps., and several millions of capital, which it can use to fight or to create a monopoly. And there is a concern named William Beardmore and Co., Ltd., which carries some weight. And another familiarly known as Armstrong-Whitworths. Not to mention the variegated ramifications pertaining to Boulton and Paul, Ltd., and the solidly compact Sopwith Co., Martinsyde, Ltd., and sundry others.

Any or all or each of them might be severally, separately, or conjointly trying to create a monopoly. And the more they try the better for trade. Competition is the life-blood of business, and commercial progress in aeronautics as in everything else depends on a chronic infraction of the Tenth Commandment. Therefore good luck to whomsoever may be trying to secure a monopoly. By trying they will stir up competition. And that will be just exactly what is wanted to stir up the Air Ministry.

International Air Navigation.

Meantime International Air Navigation is not yet a practical proposition. Although the Convention has been signed it has not yet been ratified or passed for necessary action, or whatever it is called, by the various High Contracting Powers. Apparently one cannot yet pack one's grip and take an air trip to one's old home town in a foreign country, nor can one start from Lympne (pronounced Limb) in Kent after lunch for a tour of the battle-fields of France before returning to dinner. International politics still intervene.

Perhaps by the time International Flying becomes legal the Departments of Civil Aviation, Supply, and Aeronautical Inspection will have reformed themselves and all will have become well. But one doubts it. Even International Politics work more quickly than does the internal reform of Government Departments. Still, the said Departments cannot plead that they have not had fair warning.

One notices that so far one has said nothing about the text of the International Air Convention. Perhaps therefore one had better postpone writing about it till next week. One hopes that by then all readers of these notes will have procured a copy and so will be better able to follow the arguments thereon.—C. G. G.

THE QUEEN OF NORWAY AND AVIATION.

Her Majesty Queen Maud of Norway, accompanied by the British Chargé d'Affaires, Mr. Esmondovey, went for a flight in an aeroplane on July 24th.

AN R.N.A.S. DINNER.

It is proposed to hold a dinner for officers of the late R.N.A.S. who were at Hendon between August 4th, 1914, and March 31st, 1915. It is proposed that this dinner be held at the Café Royal on August 16th next. The tickets should work out at about £2 2s. to include wines and breakages. Would any officer desirous of attending such a dinner write Captain H. H. Square at 3, Clifford Street, as soon as possible?

PAY IN THE R.A.F.

The following letter has been received:—

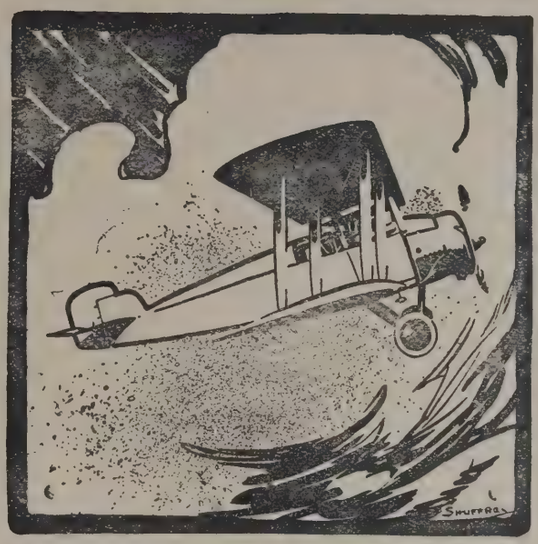
Sir,—In last week's issue of The Aeroplane I note you say, "That officers in the Royal Air Force will now be able to live on the new rates of pay. This does not apparently appear to be the view of the remaining officers in the Force.

An infantry captain is encouraged to marry at that rank, but can you inform me how a married Air Force captain can live, according to his position, on 29s. a day (a decrease of 4s. 6d. per day on present pay)? Woe to him, indeed, if he is blessed with children!

I am detailing a rough statement of my brother's expenditure, and defy anyone to show extravagance or unnecessary items. I am also omitting any sum for the education and clothing of his two children:—

	£
Mess expenses (yearly)	72
Uniform	60
Rent and rates	65
Maid	20
Household expenses (food, etc.)	200
Clothing (wife)	60
	477

These items are absolutely at the lowest computation, and the balance of £54 is supposed to cover incidental expenses, travelling, income-tax, etc. Obviously it is inadequate.



My brother has completed some hundreds of hours' flying, and, to the best of my knowledge, is still competent. He is also a pre-war soldier, and is acquainted with army routine in all its phases. However, unless someone can suggest a sane and sensible solution of how to live on the existing rates of pay he will have to leave the Force.

Apologising for writing at such length.

Late Major, R.E.

THE PAY OF THE ROYAL AIR FORCE.

By HENRY FORESTER.

Pay for officers in the fighting services of great countries has never through the ages been an affair of first importance. To fight for the king and for the nation has been both the privilege and the duty of those born in gentle estate. It was the price paid for lineage, and it was at the same time an exclusive joy. None can imagine even the most material of paymasters assessing in the metal of commerce the national daily value of Sir Philip Sidney. Neither Wolfe nor Sir John Moore nor Nelson nor his Grace of Wellington would have served the king with less devotion had the rates of pay been less than they were, or had even they been non-existent. These were leaders in the art of war, the inspiration of the age, and it is perhaps unfair to quote them as instances of the futility of daily money values in the military Services of the Crown, but it is nevertheless true that soldiers or sailors have never in recent centuries selected their professions with a view of earthly prosperity. Piracy, the Stock Exchange, the law, and other professions of a similar nature all held and still hold greater and more certain possibilities of wealth. It is the soul and not the substance which makes the great soldiers.

Yet it is unfair to historic truth to forget that inadequacies of pay in the lower ranks were made up in time of war by loot gained by vigour in action. Loot to-day is the privilege of the civilian who serves his country best by remaining far from the fields of war in a security gained at the cost of those in whom the old spirit of service survives. Hence it is necessary that the soldier of to-day should be paid a living wage. No longer is the officer drawn exclusively from a class in which wealth was common. The noble and the gentle classes of to-day are in general possessed of but moderate means, and it is no longer possible for them to serve the country entirely at their own expense.

The Great War has passed, and with it many of the habits and customs of long gone days. The world is changed, and the conditions of existence are no longer the same. It is no longer possible to rely on the spoliation of a defeated enemy for the maintenance of officers and men of the victorious army. Wars are too few to make such a system profitable to the military or charming to the civilian. Hence the three Services have in the past few weeks reorganised the conditions of service which formerly were the rule. On July 21st the Air Ministry issued a minute outlining the new scale of pay in the Royal Air Force in so far as officers were concerned, and it is with that minute that I propose to deal in this paper.

The most prominent feature of the new scale is the disappearance of flying pay. No longer is any officer to receive any additional remuneration because he is called upon to fly. With the exception of certain specialist services of a non-executive kind (such as the chaplains, the dentists, and the doctors), all officers of equal rank in the Royal Air Force will receive an equal rate of pay. It is true that in order to allay criticism it is laid down that all executive officers in the Service shall be trained as pilots, and will be liable to carry out flying duties at any time. But in practice the difference from present conditions will be but slight. No man can do two things at once with adequacy and efficiency, and it is absurd to expect staff officers or those specially engaged in administrative or technical work to do the duties of a pilot as well, even though these duties may be intermittent.

Many flying officers have held the opinion that the risks attendant on their mode of life should be recompensed by additional payment. They have regarded with faintly concealed contempt such officers as have been engaged exclusively in non-flying duties. They have never given proper credit to these others for the hard work and the mental capacity which was demanded by an efficient execution of the work allotted to them. As a parallel instance, it is generally known that the man in the trenches thinks that the staff officer lives an easy and guarded existence, and that his uses in life are not very high. It is a fallacy which, like the majority of fallacies, is strongly held by the majority of people.

The service of the King is not and cannot be a career of profit. It does not produce millionaires. Glory may be achieved, but never fortune. Heroism cannot be scaled in money values, nor can devotion to duty. Nor

does it cost a hero (flying) any more to buy a beef-steak than it does the humbler non-flying officer. Hence in arranging a scale of pay the simplest and fairest plan is to provide each rank with the emoluments necessary to decent existence, irrespective of the specific duties of each category of the rank. It is a privilege to be heroic, and bravery is not a financial asset. Each officer in the Service, so long as he does his duty, is essential in the scheme of things, and he could not well be eliminated if success is to be attained. One is therefore convinced that the Air Ministry have chosen the right course in this matter.

The special rates of pay (consolidated) paid to staff officers in the Royal Air Force have disappeared, save in the case of officers serving at the Air Ministry, who all receive additional pay ranging from £75 to £100 a year. This is intended to represent the additional cost of living in London. Directors and Deputy Directors who sit in solitary glory in whatever evacuated hotel or other building may from day to day house the Air Ministry receive special rates, irrespective of ranks. Directors have an increase of £500 per annum in some cases and £1,000 in others, the fixed rate being £2,000 a year. Corresponding improvements are made in the case of Deputy Directors.

But these aristocrats of the administration are not interesting. It is with the lower ranks of officer that one must first deal. Second lieutenants of all types now receive the rate of pay formerly given to junior flying officers—18s. a day—while all lieutenants receive 23s. a day, rising to 25s. after two years' service in the rank—that is to say, a final increase of 1s. a day over the former highest rate for the rank. Thus flying officers gain but little in the new rates, while administrative subalterns double their previous pay. There will be jubilation amongst the office files, and the adjutant will feel that he has not lived in vain. Even staff officers do not lose under the new system, though the fact that they do not get higher pay for their more responsible and more wearying work will reduce the desire to be posted to the staff.

(To be continued.)

CONCERNING KITE BALLOONS.

By the Late W. L. Wade.

To the older readers of THE AEROPLANE the early history of the kite balloons in this war is fairly well known, but for the benefit of those who have but recently acquired an interest in aeronautical matters it may be well to point out that the invention of the kite balloon, as an improvement on the ordinary spherical captive observation balloon, must be credited to the Germans.

The first of these balloons was used a considerable time before the outbreak of war, and the Germans employed quite a number of them in the military manœuvres of the years immediately preceding hostilities.

In 1914 neither the British nor French Armies possessed a single kite balloon, and considerable scepticism evidently existed as to their probable usefulness in war time.

Curiously enough, the only kite balloon in the possession of the Allies at the outbreak of war belonged to the Belgian Army, to whom it had been sold by Germany, probably in a moment of commercal enthusiasm.

The Germans very quickly put large kite balloons, which incidentally were known by the name of the firm which produced them, Parseval-Siegsfeld, into operation on the Western front, and they soon proved a valuable adjunct to aeroplanes in connection with artillery spotting, and in practice they were found to be a great deal more difficult to destroy by hostile artillery fire than might be imagined. In those days also, anti-aircraft measures of all kinds had not reached a very high state of effectiveness, so that the Parseval-Siegsfeld kite balloons were found to enjoy a considerable degree of safety.

The Result of an Agitation.

Although the operations of these machines quickly attracted the interest of many soldiers on active service, particularly certain progressive artillery officers, it was difficult to arouse enthusiasm in high places concerning their possibilities, and a public agitation arose, in which THE AEROPLANE took a prominent part.

Finally the Royal Naval Air Service decided to add one more to its wide range of activities, and therefore established a Kite Balloon Section, an experimental and instructional station being established at Roehampton under Lt.-Col. (now Brig.-Gen.) E. M. Maitland, with Squadron-Commander DelaCombe as his "Number One."

A number of balloon units were organised and personnel trained, and before long a number of balloons were sent to France to assist a somewhat sceptical Army in the punctual and correct delivery of its shells.

The possibilities of the kite balloon as a purely Naval weapon were also appreciated, and certain steamships were adapted to carry a balloon for observation purposes at sea, one of the ships being sent at an early date to the Dardanelles, where some extremely amusing episodes arose as the result of the lack of faith on the part of certain "stick and string" Naval officers.

After a short experience with the Naval balloons the military authorities were so impressed with the results that they promptly took measures for the acquisition of a supply of balloons manned by personnel drawn from the Royal Flying Corps; whereupon the Naval balloonists were told to look for other spheres of activity.

On the Western Front.

Before very long the chain of kite balloons which appeared to the rear of either side of the fighting line became such a source of annoyance and danger to the troops which served as the targets of the guns which were directed by the different balloons, that all belligerents arrived at a mutual decision to clear their opponents' balloons out of the sky, and all sorts of unpleasant tactics were adopted with this end in view.

The offensive was made both from the air and from the ground. Incendiary bullets had not then reached a high state of development, and after more or less ineffectual attempts to bomb the balloons from overhead, aeroplanes were specially fitted up with batteries of rockets which proved to be fairly successful.

From the ground anti-aircraft guns attacked the balloons in the air, and long-range artillery of the ordinary type made it their business to shell the winches on the ground with the object of severing the mooring cables. These latter guns were, on the whole, much more successful than the anti-aircraft guns, and rendered it necessary for the balloon operators constantly to alter the position of their winches.

Balloon casualties became unpleasantly frequent, and as the destruction of their crews was usually a secondary result of the destruction of the balloons, it became necessary to devise a means of escape for the observers when their balloons were set on fire.

Then, for the first time in the war, the parachute was put into general use, and although it constituted a measure of safety to the balloon observers it also added one more trial to their lives, owing to its then comparative uncertainty of operation; and it must be remembered that practice jumps were necessary, these being a great deal more trying to the nerves than forced jumps at moments of danger.

As a rule, the early parachutes opened properly provided they were given sufficient time, but on occasion the time taken was so long that the unfortunate observer fell some hundreds, and occasionally some thousands, of feet before he received any support. It must have been enough to deprive almost any man of his reason to feel himself whizzing through the air and to look up overhead and see his parachute trailing behind him looking very much like a crumpled sheet.

At the present time, of course, the parachute has become as reliable in its operation as almost any other form of mechanical apparatus, but it must have been a veritable nightmare in the early days.

Important Improvements.

The kite balloon as produced by the Germans was a fairly crude arrangement, and it was promptly improved by the Allies, notably as a result of the work of Capt. Caquot, of the French Army, who redesigned the balloon in such a manner as to increase its stability, and to reduce its head resistance, which resulted in the diminution of the strain on the mooring cable and thenceforth throughout the war it was regarded as indispensable to the efficient use of artillery.

In the meantime the Royal Naval Air Service had been left to go its own way with the development of the kite balloon as a naval instrument, which chiefly found service in connection with anti-submarine patrols and escorts to transport and mercantile shipping, and no other measure did more to destroy the morale of the crews of enemy submarines. In this connection the kite balloons did not operate only from special ships, but they were also towed from the sterns of destroyers, patrol boats, and in certain instances by merchant ships.

The last use to which kite balloons were put was in connection with defence against hostile bombing aeroplanes, kite balloons being set up in rows, which supported rows of steel wires technically known as "aprons," which were calculated to obstruct the passage of aeroplanes in the dark. These kite balloon aprons resulted both in moral and material damage to the raiders.

Taking it all round, therefore, the kite balloon has been a decidedly important factor in the war, and it is not beyond possibility that further may be heard of its activities in connection with civil aerial transport.

B.T.H. Magnetos

all-British in design and workmanship, were used **on the first Airship to cross the Atlantic, the R. 34,** on the aeroplanes which secured the British altitude record, and the first and second prize-winners of the Victory Aerial Derby at Hendon.

The above performances add to the record of B.T.H. Magnetos, and support the high opinion in which they were held by pilots during the war for reliability in service.

The WORLD of AERONAUTICS

NEWS OF THE WEEK FROM ALL QUARTERS

An Aerial Black Maria.

It is reported from the United States of America that for the first time in history a prisoner is to be transported by aeroplane from the place where he was captured to the appointed court of trial.

It is believed that by this system of giving joy rides to criminals the pre-dry average of crime may be kept up, as it is said that since the happy days of dampness law-breaking has decreased, and unless some inducements are given to criminals it it feared that some of the police will be thrown out of employment.

Heavy-Weight Aviators.

A writer in "Country Life" states that:—"Increase in size in airships means an increase in their crew, but not necessarily proportional to that in the ship itself. Thus, whereas the crew of the R.34 weighed, say, five tons—which is a generous allowance, as we are not actually quoting from definite figures—the crew of an airship of five times the size and nearly ten times the lifting capacity might be reasonably expected not to exceed 10 tons."

One agrees that the estimate of five tons as the weight of the crew of the R.34 is a generous one, as it implies that each member of the crew, even including the cat, must have weighed about 25 stone.

The Flying Ring.

According to "The Aerial Age" of America:—

"The recruiting service of the Army has planned a novel stunt in connection with their recruiting campaign. A boxing match aboard an aeroplane will take place over Camp Dix, providing the New Jersey State Boxing Commission enters no objection, though how far above the earth the authority of the commissioners may run is a question.

"Lieut. John S. Donaldson, of the First Pursuit Squadron, challenged all-comers to meet him with gloves. The challenge was accepted by Lieut. Leroy M. Wightman, a machine-gun officer handy with the padded mits. The boxers will be belted within a tiny ring in the tonneau of a large bombing plane so that there will be no danger of a plunge to earth in case of a knockout. The flying ring will be driven by Sergeant John Moore, and it is planned to have the referee and timers in another plane that will keep alongside the boxers' plane so that they can judge the points and time the rounds."

The chief difficulty seems to be the provision of view points for spectators. If hundreds of aeroplanes carrying sport-loving passengers circle round the "flying ring" there may be an exciting time.

Flying Chaperones.

An American periodical reports that:—"Because a student at Vassar took a long air ride with a young lieutenant in the U.S. Air Service, the possibilities are that aeroplane joy rides may become prohibited by the social laws of Vassar College. The student's name has been withheld, but because of her exploit the students have considered inserting rules for aeroplaning into the laws, which are made and enforced by the students' association.

"An army aviator was flying over the college grounds, and landed in the driving park. He asked one of the students strolling nearby whether she would care to go up with him, and she accepted. It is not yet decided whether this is a violation of the rule against going riding unchaperoned, but aviators are advised for the present to use three-passenger planes."

The point that is not clear is whether each young army aviator is expected to carry his own chaperone in his three-seater or if he is to rely upon local resources for the supply of one when the exigency arrives.

One suggests that the former is the more practical scheme, and that an official corps of flying chaperones should be organised, and that they should wear the observer's wings, with perhaps a heart in place of the conventionalised eye.

Conductors to——

In view of airship accidents a number of writers in the lay Press have been suggesting that all airships should be fitted with lightning conductors. The columns of hot air written on this subject would form excellent conductors, doubtless, but the people who make the brainy suggestion do not point out a practical method of conveying the electric fluid to earth. An unearthed conductor would be an invitation to lightning. Can it be that this sort of thing is part of the Bolshevic propaganda?

In the Fashion.

Reuter has announced a strike of mail pilots in the United States of America. It was declared on Friday, July 25th, following on the refusal of the Post Office Department to reinstate two pilots who had been discharged on account of refusing to ascend in fog recently. The New York-Chicago air mail service is affected.

His Master's "Hum."

"A. R. E. M.," in the "Dundee Advertiser," has been telling some dog stories. He writes:—

"During the war most air stations had their full complement of canine mascots. Quite a number of these dogs were confirmed fliers, and I knew several of them who had done enough hours in the air to qualify for their 'wings' long before the Armistice.

"A . . . remarkable animal is a fox-terrier which belongs to one of our best-known airship pilots. The first time this dog was taken for a flight he got so terrified that he jumped out of the ship and fell fully twenty feet to the ground.

"When he was taken up on subsequent occasions the precaution was taken of tying him in, but, strangely enough, he showed no fear afterwards, and made no efforts to get swiftly back to earth. This dog has up to date done considerably over 100 hours' flying.

"The most remarkable thing about him, however, was this. By some wonderful means he always knew his master's airship when it was coming home. Two or three ships might come in from patrol perhaps at dusk, and he would pay no attention to them. Then presently his master's ship would be sighted, and away he would go down to the landing-ground to welcome it.

"None of those who noticed him doing this time after time knew how he was able to distinguish one ship from the other. Perhaps there was something in the hum of the engine that he recognised, or perhaps it was just instinct—but the fact remains that he undoubtedly did know."

An Aerial Grand Stand.

According to a correspondent of "The Times," "an aerial wedding was the feature of the New York police athletic meeting . . . . . when Miss Wily Schaeffer, of this city, and Lieutenant George Burgess, of the United States Aviation Corps, were married in mid-air with the assistance of the wireless telephone. The ceremony was performed by the Rev. Alexander Wouters in the presence of thousands of people at a height of 2,000 feet.

"The young couple ascended in one machine while the clergyman was a passenger in a second aeroplane, from which, using a wireless telephone, he read the marriage service and heard the bride and bridegroom exchange their vows. The witnesses, the best man, and the bridesmaid remained on *terra firma*, where, together with the crowd which filled the grand stand, they could hear every word of the service by means of megaphones attached to wireless telephone receivers."

After reading of the attendance of "thousands of people at a height of 2,000 feet," one is disappointed to read in the second paragraph that these wedding guests were in a grand stand on the ground.

One wonders how much further this kind of imbecility can go.

In Haste.

According to the "Aerial Age," of America, "Lieut. Warren P. Kite, for twenty-two months instructor at Kelly Field, eloped with Miss Orpha Kate Arnold, ranch owner and oil operator of Larned, Kans. After a 55-minute flight he landed at Hays, where the ceremony took place. Lieut. Kite arrived at Larned nine days previous to the wedding, in order to participate in local home-coming celebrations, during which he became acquainted with the bride."

One's experience of American methods of non-production of aeroplanes during the war led one to believe that the reputation for "hustle" previously held by the U.S.A. was overrated. But Lieut. Kite is evidently one of the much-advertised "do-it-now" type. To have eloped by aeroplane with a lady he had met only nine days previously indicates enterprise. One's good wishes are with the couple.

A Generous Gift.

Captain Sir John Alcock and Sir A. Whitten-Brown have given £2,000 to the employees at Vickers' Weybridge works who constructed the aeroplane in which they crossed the Atlantic. The firm is supplementing the amount to make it sufficient to pay one week's wages to all the employees at the works.

The WORLD of AERONAUTICS (continued)

On Peace Night.

In the "Referee" of July 20th, "Dagonet" wrote:—

"I have always respected peace, but on the night of July 19th I looked down upon it. I looked down upon it from the heavens above. What a sight! At first I hesitated about looking down, because I was afraid it would make me giddy. But it didn't. My giddy days are evidently over. I felt so comfortable that I was able to write in the notebook that I took up with me. I thought of writing a full account of peace night as I saw it from the aeroplane and dropping the sheets down one by one addressed to the Editor of the 'Referee,' with a written request that anyone picking them up would carry them at once to the 'Referee' office. But I realised that there might be more difficulty in getting about down below than I was experiencing up above. So I reserved my description for a more convenient occasion, and asked my friend to put me down near Salisbury Square. He explained that it was within the four-mile radiance—I beg pardon, radius—and that he couldn't, but that he would drop me on the edge of the radius. And he did."

The Production of Gas.

The world of aeronautics and the production of gas—or hot air in lieu thereof—have long been indissolubly connected. The present note deals, however, with that rarer, more silent, and efficient branch of the subject which has to do with the chemistry and manufacture of hydrogen.

Major P. Litherband Teed, A.R.S.M., A.I.M.M., has during the war been very intimately connected with the production of the hydrogen used for the inflation of the numerous lighter-than-air craft which have been used in H.M. Service during the war, and in "The Chemistry and Manufacture of Hydrogen" (Edward Arnold; price 10s. 6d.) he has embodied the latest and most up-to-date information as to the qualities of hydrogen and the various processes by which it may be manufactured.

The chemistry of hydrogen in its inorganic combinations and in certain of its more important organic compounds is dealt with briefly, but in a manner intelligible to those whose chemical knowledge is of the most elementary. Both the chemistry and the practical methods employed in the various methods which may be used for the commercial production of the gas are described in detail and the advantages and disadvantages of each process are discussed.

The book gives lists of the existing patents which affect the various papers, and terminates with an appendix giving the physical constants of hydrogen in a form applicable to aeronautical use.

A Literary Effort.

The story of their pioneer attempt to cross the Atlantic is told by Mr. H. G. Hawker, M.B.E., A.F.C., and Lieut.-Commander K. Mackenzie Grieve, A.F.C., R.N., in their book, "Our Atlantic Attempt," published on July 15th (Methuen. 3s. 6d. net).

The preface is written by Major-General the Right Hon. J. E. B. Seely, C.B., C.M.G., D.S.O., M.P., the Under-Secretary of State for Air. Mr. Hawker has written most of the chapters, and seems very pleased with everyone, and showers praise on the "Daily Mail," the machine, and everything connected with the flight.

Lieut.-Commander Grieve tells about the difficulties of navigating, and supplies some notes on the flight.

The story is somewhat disconnected, and there is some duplication of facts, but it is quite interesting reading.

Captain Gordon Aston's introduction is extraordinarily sound and well written.

The Projected Australian Flight.

The following letter has been received:—

Sir,—With reference to the scheme for the formation of an Imperial Aerial Survey Corps which I have seen outlined in a contemporary service paper I trust that I may be permitted to express an opinion on this matter, which, as a traveller and a soldier, is one which is deeply interesting to one such as myself.

It is indeed gratifying to note the position the Australian Government has taken with regard to the projected Australian flight, and as one who is conversant with the general policy of the Commonwealth Government, I think we shall find that our Overseas Dominions will be scoring over the Mother Country as regards commercial aviation. I say this having in mind the persistent procrastination of the responsible authorities at Home dealing with this crucial matter.

We have sufficient evidence to confirm what I have previously said when we read that the Australian Government are doing everything that is possible to assist their flying men in obtaining a thorough training before undertaking the more serious work of piloting machines across the southern seas.

If only our own official mandarins would take a more broad-minded view of the matter and dispense with the innumerable Governmental channels there is every reason why we too should now open a much brighter prospective future for those numerous pilots who at present see no hope of utilising their war experience on a profitable basis. By this principle we can show our Colonies that we have a sporting Government out to play the game by our fighting men in addition to furthering our aviation future.

F. W. NICHOLSON (late B.E.F., and W. Australia).

The War and Victory Medals.

The following letter has been received:—

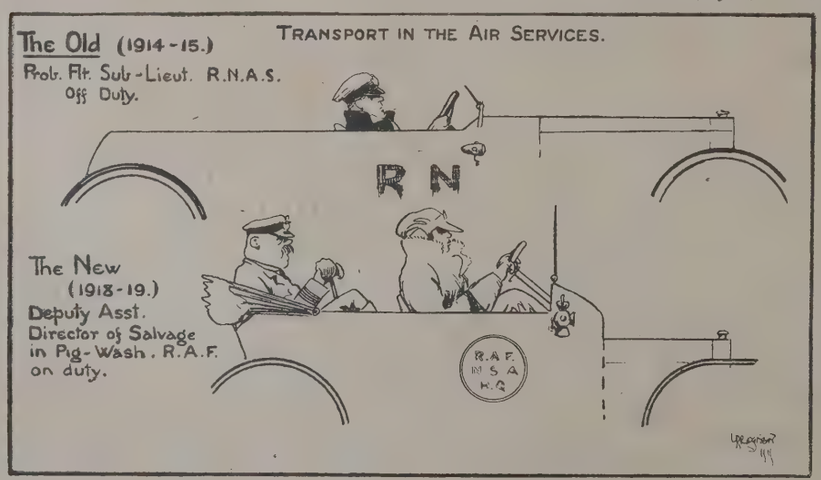
Sir,—May I bring to your notice the fact that the men who manned the anti-aircraft searchlights and guns in England are not included in the award of the British war and victory medals?

Many of us during the war volunteered for service overseas, but were refused on the grounds that we were just as much on active service repelling hostile aircraft at home as if we were in France.

Now, at the end of the war we find ourselves with nothing to show for our services, while several people who "entered a theatre of war" and are entitled to the medals never heard a shot fired.

In view of the fact that the old R.F.C. and R.A.F. airmen who composed the Home Defence squadrons are to receive the medal, surely we, who contributed in no small measure to the success of the Anti-Aircraft Defence, are entitled to some recognition?

EX-SAPPER.



Pensions for R.A.F. Officers.

Sir,—I should be glad if you would kindly allow me to draw the attention of your readers to a misleading paragraph in THE AEROPLANE entitled "Pensions for R.A.F. Officers."

No doubt, a number of ex-officers will regard this announcement as a genuine offer to consider their claims, but the majority will probably regard it as a farce, which I can prove it is.

In June, 1916, whilst serving in France as a private, my O.C. advised me to apply for a commission. I acted upon his instructions, and applied to the R.F.C. people, who sent me chasing over half of France to be examined by various doctors. Not satisfied with their findings, which, strange to say, all agreed that I was A1 and fit to fly, the Great Ones told me to report in London at the Hotel Cecil, where I was again examined by a civilian doctor, the only gentleman I ever met in the R.F.C. holding an official position, as distinguished from the R.F.C. who did fly. This doctor agreed with my former examiners, and I was sent back to France to await developments. About the last week in July I received a telegram from the War Office to inform me that I was a full-blown second lieutenant. A few days later a letter arrived from the War Office containing instructions *re* kit and reporting orders.

Whilst in training in England, I experienced pains in my body, which became so acute that I was one day carried from the aerodrome to my quarters, a draughty, leaky hut, and I lay there until the doctor arrived. Certain other events transpired, and I was sent for a Medical Board to the Hotel Cecil, where I was pronounced "Unfit any duty for three months." At the expiration of this period I was again "boarded" and pronounced "Unfit for any duty for six weeks." Eventually I was kicked out as "Unfit as pilot or observer" and granted £33. For over twelve months I was under my own doctor's in-

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

The WORLD of AERONAUTICS (continued)

structions and received treatment for rheumatism. I was treated at various military hospitals for the same complaint, and although I frequently sent particulars of my case to the Ministry of Pensions, accompanied by medical certificates, I could not get any satisfaction until I threatened to state my case in the Press. Then the "Heroes of the Great War" sat up, rubbed their eyes, and did something in this fashion.

One morning at 10 o'clock an orderly in the R.A.M.C. arrived at my home and presented me with a note instructing me "to report at the 2nd Western General Hospital, Manchester, at 9.30 a.m., February 12th, 1918, for a Medical Board." It was then half an hour after time, but I went to the hospital and received a "ticking-off" from a colonel for coming late. I allowed the gentleman (?) to finish his speech, and then pointed out to him what had taken place. He merely grunted, "Sit down; I'll see you presently," and he left me. A few minutes later I was joined by a captain of the R.A.M.C. on leave from the East, and seeking an extension of leave on the grounds of being "unfit to travel." The colonel then returned, accompanied by a corporal, and after a few words with my captain acquaintance he turned to me and said, "Oh, yes, now and how do you feel?"

They all three then sat round a table, and the corporal R.A.M.C. began to question me. I at once asked the colonel if this sitting was my Board, and he replied, "Yes, we are conducting this hospital, not you." To which I replied, "Well, sir, if you can derive any satisfaction from that, you are welcome to it; but I shall take this matter further. You first of all bungle the appointment, then you press into service an officer who is not fit for duty on his own admission, and, to crown the lot, you sit there whilst a corporal performs the duties of a qualified medical man." The corporal then picked up a sheet, which, I presume, was my medical history, and said, "He is all right, sir; only post-influenza." I was then told to go, and a few days later I received a letter from the Ministry of Pensions which read, "As your disability was not due to nor aggravated by Military Service, you are not eligible for any further grant from the funds at the disposal of this Department." The Ministry of Pensions has in its possession all these facts and offers from me to prove all that I have said, and an offer to place my correspondence before them, and yet nothing is done. I was never treated for influenza in my life, but my protests are of no avail.

Now, if any of your readers expect genuine consideration after what I have written and can prove, they are indeed optimists of a high order. In conclusion let me say that I have been in communication for the past two years with the Ministry of Pensions.

AN ENGINEER.

Martinsyde, Ltd.'s, Athletic Sports.

On July 19th, Martinsyde, Ltd., of Woking and Brooklands, held their annual athletic sports meeting under the auspices of the Martinsyde Recreation Club. The meeting was a great success despite the fact that it was held on the day chosen for the official celebration of Peace, and also that the weather was not all that might have been desired.

THE ROYAL AERO CLUB.

A meeting of the Flying Services Fund Committee was held on Wednesday last, July 16th, 1919, when there were present:—Lieut.-Col. T. O'B. Hubbard, M.C., R.A.F. (in the chair), Mr. Chester Fox and Mr. Stevenson (Assistant Secretary).

GRANTS AND ALLOWANCES.—The following Grants and Allowances were made:—

(41) An allowance of £3 a month for three months to the mother of a C.P.O.II in the Royal Naval Air Service who had been killed on active service.

(45) A Grant of £5 to an Ex-1st Class Air Mechanic in the Royal Flying Corps who had been incapacitated on active service.

(74) A Grant of £10 to the mother of a Corporal in the Royal Flying Corps who had been killed on active service.

(83) An allowance of £3 a month for six months to the widow of a 1st Class Air Mechanic in the Royal Flying Corps who had been killed on active service.

(116) An allowance of £4 a month for six months to the widow of a 3rd Class Air Mechanic in the Royal Air Force who had been killed on active service.

(132) An allowance of £1 a month for six months to the mother of a Private in the Royal Air Force who had died on active service.

(134) An allowance of £2 a month for six months to the widow of a Sergeant in the Royal Flying Corps who had died on active service.

(138) The school fees, etc., for at least one year, of the child of the widow of a Private in the Royal Air Force who had died on active service.

(188) An allowance of £1 a month for six months to the widow of a Private in the Royal Air Force who had died on active service.

(220) An allowance of £2 a month for twelve months, to pay the rent of her house, to the mother of a Sergeant in the Royal Air Force who had been killed on active service.

(221) An allowance of £1 10s. a month for six months to the widow of a Sergeant in the Royal Air Force who had died on active service.

(223) An allowance of £2 a month for six months to the widow of a 2nd Class Air Mechanic in the Royal Air Force who had died on active service.

(226) An allowance of £2 a month for six months to the widow of a Corporal in the Royal Air Force who had died on active service.

(227) An allowance of £2 a month for six months to the mother of a 2nd Class Air Mechanic in the Royal Air Force who had been killed on active service.

(229) An allowance of £2 a month for six months to the mother of a 2nd Class Air Mechanic in the Royal Air Force who had died on active service.

(230) An allowance of £1 10s. a month for three months to the mother of a 3rd Class Air Mechanic in the Royal Air Force who had been killed on active service.

(231) An allowance of £2 a month for three months to the mother of a 2nd Class Air Mechanic in the Royal Air Force who had been killed on active service.

(232) An allowance of £1 10s. a month for three months to the widow of a 1st Class Air Mechanic in the Royal Air Force who had died on active service.

(253) An allowance of £1 a month for six months to the widow of a Private in the Royal Air Force who had died on active service.

The Deatn of Madame de la Roche.

On July 18th Madame de la Roche, wrongly called Baroness by the daily Press, was killed while flying as a passenger with M. Barrault, at the Crotoy Aerodrome. The pilot also was killed.

Originally an actress, she learned to fly on a Voisin of the earliest type—fitted with side panels, Vivinus engine, and all the other horrors of immaturity—at Mourmelon in the autumn of 1909, taking her pilot's certificate on October 21st of that year. Towards the end of the year or the beginning of 1910 she had her first serious flying accident and broke her leg. Undeterred she flew again immediately after her recovery, and in June, 1910, she was a competitor at the second aviation meeting at Reims. Here on one fatal day she was brought to ground through becoming involved in the backwash of another machine, the pilot of which was, perhaps unjustly, thought to have brought about the accident deliberately. Her injuries were serious, both her legs and one of her arms being fractured.

Though she might at this stage have relinquished the practice of aviation without discredit, she again took to the upper atmosphere so soon as she was fit. This time she transferred her loyalty to the Farman firm, and created several world's records for height and duration in women's classes. She and Madame Dutrieu were keen rivals, and shared such glory as was then open to women in the new art.

Recently, on a Caudron biplane she raised the height record for women pilots to 16,000 feet.

During the war it is said that she made a series of endeavours to enter the French Aviation Service, but naturally without success.

Singularly beautiful, she was imbued with a high spirit of courage. She descended to no cheap methods of self-advertisement, and devoted her sincerest efforts to the furtherance of the best interests of aviation. Though she excelled in what is at present essentially a man's sport and profession, she never lost that feminine charm which enthralled all who knew her. Beauty alone gains many adherents, but when it is allied with the subtle attraction which made all France the slave of Ninon de l'Enclos there are none who fail to be enthralled.

Coming Events.

AUGUST.

Friday, August 1st.—Amsterdam Aircraft Exhibition opens.

Saturday, August 2nd, Sunday, August 3rd, and Monday, August 4th.—Tenth London Aviation Meeting at Hendon.

Tuesday, August 5th.—Handley Page Social and Athletic Club's Sports. Starting at 12 midday at Cricklewood Lane.

Saturday, August 16th.—R.N.A.S. Officers' (Hendon) Dinner at the Café Royal.

Thursday, August 21st.—R.A.F. Annual Athletic Meeting at Stamford Bridge.

Sunday, August 24th to Sunday, August 31st.—The "Avenir's" Tour de France Aérien is due to start.

Saturday, August 30th.—Hendon-Brighton-Hendon Air Race at Hendon Aerodrome.

SEPTEMBER.

Wednesday, September 10th.—Schneider Cup Competition, Bournemouth.

Saturday, Sept. 20th.—Hendon-Manchester-Hendon Air Race at Hendon Aerodrome.

DATE TO BE ANNOUNCED LATER.

Hendon-Paris-Hendon Air Race.

JACQUES SCHNEIDER INTERNATIONAL RACE.

The race for the Jacques Schneider International Trophy will be held on Wednesday, September 10th, 1919, at Bournemouth. The course will be over a circuit of about 30 miles, starting from Bournemouth, and taking in Swanage and Christchurch

Messrs. S. E. Saunders, Ltd., the well-known yacht and aircraft builders, of Cowes, Isle of Wight, have kindly placed their new erecting shops and slipways at the disposal of the Club for the accommodation of the competing machines.

Machines representing the British Empire must be ready not later than September 1st, 1919

The Committee of the Royal Aero Club will select the three competitors to represent the British Empire, and reserves to itself the right to hold eliminating trials

Entries are to be made to the Royal Aero Club, 3, Clifford Street, London, W.1, not later than July 31st, 1919. Each entry must be accompanied by the Entry Fee of £20.

THE R34 DINNER.

On Wednesday, July 23rd, the Royal Aero Club entertained the officers and crew of R. 34, together with a number of distinguished guests, at a dinner at Princes' Galleries. Unfortunately, owing to the extremely bad acoustic properties of the room, it was extremely hard to hear what anybody was saying.

The Duke of Atholl, chairman of the Royal Aero Club, in proposing the toast of the guests, said that, thanks to the Air Ministry, we had not got stagnation in aviation in this country. (One may here interpolate the remark that, as his Grace of Atholl said, we have not got stagnation, we have in fact, got full speed astern. Perhaps being a Scot the chairman was merely being sarcastic.)

Continuing, the Chairman said that throughout the voyage the R. 34's sorrows were our sorrows, and everybody had followed their adventures with the deepest interest. At the same time there was nothing new under the sun, and many of the R. 34's adventures were quite old. He himself remembered as a small boy going to the Royal Aquarium and seeing a beautiful lady dressed in blue descend from the air after being fired out of a cannon. The Americans similarly saw a beautiful figure in blue descend from R. 34 when she arrived. Also, they had heard that the favourite position for the officers of R. 34 was asleep under the table. There was certainly nothing new about that.

Becoming serious, the Chairman said that the feat was one of the greatest skill and endurance. We had to thank our late enemies for giving our Air Force its chance. The first Zeppelin that came over this country did more good than any other mistake which the Germans made. This voyage of R. 34 brought America closer to England, and he congratulated the officers, crew, designers, and constructors of R. 34.

Mr. Davis, the American Ambassador, supporting the toast, referred to the personnel of R. 34 as being the most distinguished company who had ever visited America. Referring to the chairman's recollections of his childhood, he said that he himself at country fairs remembered beautiful ladies in spangled tights descending by parachutes from balloons, but he had never been able to reach the spot where they fell before they had been picked up.

Mr. Davis referred to a note of Horace Walpole's written in 1785, in which he said that three more balloons had gone up that week, and added, "Now that we have an aerial fleet, what signifies the loss of the sea?" (It would be well if people in these days realised the truth of that remark.) The Ambassador concluded by saying that America's only complaint was that the distinguished gentlemen of R. 34 had not remained longer on their shores.

Major-General Seely, as fluent as ever, was another supporter. He said that the most striking feature of the voyage was the reception of the crew in the United States, and the voyage was worth while a hundred times over. He remarked that the officers of R. 34 said that their crew were the finest chaps they had ever sailed with.

Major-General Sir Hugh Trenchard who also supported the toast was received with prolonged applause. He said that the crew of R. 34 not only commanded success, but deserved it. The R.A.F. was not only first as a fighting service, but remained first in the paths of peace, and this voyage was the keystone of the arch in the path of aircraft progress in the world's peace. He was certain that there must have been perfect confidence and co-operation between all ranks in the ship.

Confidence would always win, and confidence was only got by sound team work, and that again was only got by hard work all round. The crew of R. 34 had learned to work thoroughly together. They had added to the best traditions of the flying services in the war, and had set a new tradition for the Royal Air Force.

Mr. H. White Smith conveyed the congratulations of the Society of British Aircraft Constructors, and was proud that the constructors had a partnership in this great deed. The constructors could now turn their attention to commercial purposes. We were not yet ahead in airships, and the R. 34 was very like the Zeppelins of 1916. There was need for development in aircraft and in engines also. People rather lost sight of the possibilities of airships, but they had a great future.

R.34's Replies.

The toast of the R.34 having been duly honoured, Brig.-General Maitland, D.S.O., in replying, laid particular emphasis on the fact that he was only a passenger on R. 34, and that none of the credit for the voyage was due to him He stated that this fact gave him a better opportunity of observing the splendid work done by the officers and crew, and he paid a most glowing tribute to Major Scott commanding R. 34. He recalled that an American paper had described Major Scott as "a portly, ruddy-faced individual." Personally he thought that these qualities gave one confidence in Major Scott. His men had followed him from the Old World to the New, and from the New to the Old, and he believed that they would follow him from this world to the next. Major Scott was quite imperturbable in any emergency. General Maitland also gave thanks to the Admiralty Wireless people, to the Marconi Company, and to the Beardmore and Sunbeam firms for their shares in the enterprise.

Turning to the voyage itself, General Maitland said that the Air Ministry had sent them, firstly, to get scientific data, secondly, to demonstrate the possibilities of rigid airships, and, thirdly, to visit Newfoundland and America. They had learnt a great deal, considering that airships were still experimental. For instance, they had learnt that electrical storms could be surmounted. They always felt perfectly safe with Major Cook as navigator. Major Harris, their meteorologist, was a real wizard in his own science, and he believed that meteorology would become a popular study. Captain Durrant's wireless worked well, but their directional wireless was none too good. Their experiences made them appreciate all the more the magnificent performance of Read, Alcock, Brown, Hawker, and Grieve.

As to the utility of airships, he thought that they would be useful in locating ice fields, which were a danger to navigation, and in forestry and survey work. Also airships were certainly a method of avoiding seasickness, and if for this reason only he thought airships had a commercial future. As regards the position of our airships, he thought that we were now well on terms with Germany and ahead of all other nations. The present time offered a fine opportunity for British enterprise. The rôle of the airship was that of a long-distance non-stop vehicle. Aeroplanes would work in with airship lines. Each type had its own advantages. General Maitland concluded by paying a warm tribute to the reception which they had all had in America.

Major Scott, skipper of R. 34, said that he had absolute confidence all along in his ship and crew. The brain of an airship pilot had to be full of figures, and he had to be for ever calculating what to do with the ship. For example, owing to the variations in temperature an airship was always inclined to fly nose down in the evening and to fly nose up in the morning. Electrical storms had the effect of throwing the ship about suddenly without warning, and their effects would have to be closely studied.

Major Scott further said that nothing could have been more perfect than the arrangements made for handling the ship in America, where she was moored out for a hundred hours without shelter of any kind. He said that Major Cook's navigation was marvellous, as was Major Harris's meteorology. Officers and men backed him up enthusiastically right through; in fact, he had to order Captain Shotter, the engineer officer, to go to bed.

Major Cook the navigator, remarked that on this voyage he did not use any "new-fangled gilguys." He stuck to the old-fashioned sextant for his navigation. He had had good advice from Lieut.-Commander Grieve. He had had a patent gyroscopic horizon sent to him before starting, but, unfortunately, the inventor had forgotten to explain how it worked. He found that a cloud horizon worked quite sufficiently well. An ordinary bomb sight was quite useful for judging drift and speed.

Major Harris, the meteorologist, said that the upper air was like a great unexplored world, but he believed that future study would make it possible that the danger areas could be buoyed out. Cloud strata should always be observed, as the clouds indicated almost better than anything else the actual state of the atmosphere. There was an enormous amount of investigation to be done. He suggested that there should be a meteorological officer on every airship until they had plotted things out a bit. He also suggested that meteorological information from land stations might well be boosted up by two or three hours. All countries should help in compiling the world's meteorological knowledge.

Major-General Brancker, proposing the health of the chairman, referred to his memory of transferring the Army airships to the Admiralty, when, as he said, the airship personnel were "handed over, kicking and biting, to the Navy." As regards the future of aeronautics, he said that we had now got to face hard facts. We had been absolutely on top in the war, and we must keep there in peace. The future of the British Empire depended on aviation, and the future of aviation depended on the Air Ministry, the Royal Air Force, and the Royal Aero Club.

MANNERS AND CUSTOMS IN NEW YORK.

Sir Charles Allom, of White, Allom and Co., and the Gosport Aircraft Co., was ejected from the lobby of the St. Regis Hotel on June 25th, following a heated argument arising out of the action of two girls in soliciting subscriptions to Mr De Valera's £1,000,000 loan for the "Irish Republic."

The girls displayed a Sinn Fein emblem which caused Sir Charles to protest to the manager, Mr. Hann, that persons inimical to the interests of the Allies were being harboured.

Some further words passed, in the course of which Sir Charles declared that such persons were traitors, whereupon he was grasped by three porters, who pushed him out to the pavement.

Sir Charles offered considerable resistance, and his hat and cane were left in the lobby. The incident was watched by a fashionable crowd.

To "Aeroplane" Subscribers.

Since the Armistice, the subscription list of the AEROPLANE has steadily increased: an eminently satisfactory development which we are anxious to encourage.

Of the many books published on the war on the Western front, none conveys a more realistic impression of the work of a particular arm than FLYING COLOURS by Captain H. M. S. Saundby, A.F.C., R.A.F., M.C., published at **£2 2s.** net (Edition de luxe) and **15/-** net (Popular Edition).

Among the art books published in the last year or two, none can claim to be a more faithful reproduction of the artist's colour scheme and that indefinable thing atmosphere.

FLYING COLOURS is a permanent memorial of the life of "the pilot in action," as Major-General C. B. Ashmore calls him. It was very costly to produce, and necessarily the price to the public had to be high.

Many would like to possess it who do not feel disposed to put down Two Guineas for the larger edition or Fifteen Shillings for the smaller.

How to meet their views? We make a special offer to any subscriber for one year to the AEROPLANE: namely to give him the right to purchase either edition at half price.

All he need do is to send us the accompanying order form with cheque for one year's subscription, plus **£1 1s.** or **7s. 6d.** according to the Edition he wishes to have.

In order to be fair to current yearly subscribers we extend the half-price concession to them also. If a subscriber has paid a quarterly or half-yearly subscription, then to secure the right to participate he should send the balance for the year.

Subscribers who have given their orders through the trade, and not direct to the AEROPLANE Office, must sign the form below or a copy thereof, and hand it with the balance on account of the book to their retailer for transmission to the AEROPLANE.

If the subscriber already has a copy of FLYING COLOURS, and would wish to take advantage of this offer, then he may secure McCudden's "Five Years in the R.F.C." **(7s. 6d.)**; Richthofen's "Red Air Fighter" **(3s. 6d.)**, and Gill's "The Aerial Arm" **(6s. 6d.)** at half price, *i.e.* **8s. 9d.** the three, plus the year's subscription to the AEROPLANE.

ORDER FORM.

To THE "AEROPLANE,"
61, Carey Street, W.C.2.

Please send me the "AEROPLANE" for one year post free **(30/- inland; 35/- abroad)** and one copy of the { Edition de luxe / Popular Edition } of FLYING COLOURS at half price { **£1 1s. 0d.** / **7s. 6d.** } for which I enclose remittance value **£ s. d.**

THE RE-ORGANISATION OF THE R.A.F.

The leader in THE AEROPLANE of Wednesday, June 18th, makes one think, and reporting, as it does, General Trenchard's speech at the Independent Air Force dinner, makes one read what one might otherwise skip with alacrity. What is the gist of it all? What is likely to develop in the R.A.F.? As a 4-year victim of uniform (in aviation), one wonders.

I, unlike you, have always had faith in the Royal Air Force—the single control of flying instead of the dual muddle existing in 1914. But my ideal has lived as an ideal only, and has been poor in health ever since April 1st, 1918.

The single Air Force is right, without question. One force for land, one force for sea, one force for air—that is the ideal. Intercommunication of the widest sort follows after—sailors fighting alongside soldiers on land, soldiers transported on ships by sailors, the airmen dealing with both. Let's put that idea down as the basis of this talk—a single independent Air Force is right and necessary. Now to talk about its practical realisation, in the present circumstances.

A practical air force will train its own people, in its own schools, for its own job, yet keeping always in touch with its sister services. The education required will be a liberal one—more liberal than either Army or Navy, and yet lighter than either in that deep knowledge of any particular subject should not be requisite. The force will be composed of engineers as its head people, with a personnel of pilots, mechanics, clerks, etc., etc.

For once the engineer—the son of Martha—should come into his own. He made flying and he alone has nursed the baby. Civil aviation must surely be run by the Air Force, so far as its regulation is concerned. Regulation implies a good deal, and must certainly in this case control a great deal.

All air stations, civil and military, must be supervised by the Air Force, and therefore the Air Force will, more largely than either Navy or Army, be a force for both peace and war.

Perhaps even, in view of the League of Nations, it may be a peace arm, more than a war preventative. Passenger carrying, the dream of the novelist, is never likely to bulk largely in air councils of the future. It can only be done at a prohibitive price, and therefore cannot become a large business. But mail service must gradually develop to an unimagined extent, and, by its size and importance, necessitate control by a large State Department.

The Air Force logically comes into its own here. In war—fighting, reconnaissance, spotting, bombing, etc.—in peace, the transport of the world's news and communications—that must inevitably be the future. How does all this apply to General Trenchard's speech?

Not one word has been reported as to any utterance of the General's regarding civil aviation! Many of the older officers in the R.A.F. are hanging on to office simply because they are reluctant to leave aviation, and yet can see no possible opening for civil aviation divorced from the State. How can there be any opening if it is accepted that the future lies as the present exists.

One hears wild talk by various officers in high position regarding the future (General Trenchard is not ranked amongst them by the writer) including statements to the effect that flight is safer than any other transport, and passenger flight is a commercial possibility; but attempts to establish a definite mail service appear to be lacking.

Unless some strong action is quickly taken by the Air Force authorities, much—I guess most—of the metaphorical ground gained by mechanical flight will be lost.

The large engineering firms, roped into aviation for the war, will abandon an ungrateful child, and take to their legitimate and more profitable offspring. These large firms can be made the backbone of the aviation industry now by encouragement, and the declaration of a practicable policy. War alone cannot support a large industry, and, in my opinion, passenger carrying by aeroplane will also fail.

A State mail service, on the other hand, will mean a constant supply of machines, and a growing demand as the service widens. This will bring in its train the necessary maintenance of aviation works, and all they include.

Let me suggest that a definite movement should at once be made to start a State mail service, and that a definite pronouncement of policy appertaining thereto should be given.

The present situation is intolerable—one not to be borne. Our heads speak about things with the beautiful carelessness born of no work. Passenger carrying from England to Australia, lobsters from France to England, fruit from California to England—it's all talked about. *Meanwhile*, nothing's done.

There have been various stunts, such as London to Madrid, London to Egypt, etc. Has anyone ever worried to work out these flights? A few facts might be useful here.

The London-Egypt flight worked out at 2½ miles per hour—I don't know the cost.

The Atlantic crossing by Alcock (assuming his mail to weigh 50 lbs.) works out at £500 per ton mile.

The N.C.4 flight across the Atlantic works out at £700 per ton mile if the useful load carried amounted to 50 lbs.

These are facts ascertainable by everybody. Meanwhile, colonels sit and answer minutes—minutes as stupid as the answers given by the colonels. Majors are in charge of sections, sections that are represented by half a dozen letters of the alphabet—and that mean as much. Captains are in charge of subsections—a busy one deals with one item of aeroplane equipment.

Everyone asks as to a policy—none is declared. In the meantime the lighter-than-air section (to which I was originally attached) makes capital (temporary capital, be it said) out of public ignorance. "R.34 flies to Germany." "Wind put up the Huns," etc., etc.

A refreshing article appeared in the "Daily Mail" signed by Lieut.-Commdr. Kenworthy on "lighter-than-air." Like all aircraft matter at the present day, it is hard to give the exact cost of flights, but I will attempt an estimate of cost of lighter-than-air flight.

A rigid costs about £400,000.
The shed costs about £400,000.
The landing party of 500 men costs about £100,000 per year.
The life of the machine (by Hun figures) is about one year.
The available flying days (according to Hun figures) at 24 hours per day, is about 50 as a maximum.
The average speed (according to Hun figures) is about 40 m.p.h.
The average load carried (useful) is about 10 tons.

ESTIMATE OF SERVICE WITH ONE RIGID AIRSHIP BETWEEN POINTS 5,000 MILES APART.

Assumptions made.—1. Average speed of 40 miles per hour.
2. Average load of 10 tons (useful).
3. Flying days (24 hours per day), amount to 50 per year.
4. Effective life of airship is 50,000 miles' flying, or 1,250 hours in one year.

	Cost per year.	Per cent of total cost.
Rigid.—Life one year. Cost £400,000, including repairs, new engines, etc., and value as scrap...	£400,000	45
Sheds.—Life 15 years. Cost £400,000. Two sheds	53,300	6
Handling crews.—500 men at £200 per year. Two crews	200,000	22
Mechanics.—50 at £300 per year. Two squads...	30,000	3
Riggers.—50 at £300 per year. Two squads	30,000	3
Pilots.—10 pilots at £600 per year	6,000	1
Petrol.—50,000 gallons at 2s. 6d.	6,250	1
Oil.—2,500 gallons at 5s.	625	1/10
Insurance.—30 per cent. of value of airship	120,000	13
Offices.—At £2,000 a year. Two offices	4,000	5/10
Management.—Say	10,000	1
Aerodromes.—£10,000 a year, including water, light, etc. Two aerodromes	20,000	2
Car Services.—£2,000 a year. Two services	4,000	5/10
Gas, and gas plant.—Say	15,000	1 9/10
	899,175	100
Say ...	£900,000	

Miles flown per year ..... 50,000.
Cost per mile ..... £18.
Load carried ..... 10 tons—500,000 ton miles.
Cost per ton mile ..... £1.80—36s.

The total cost of flight per ton mile now amounts to 36s., which is equal to an estimated cost of heavier-than-air flight at 100 miles per hour (NOT 40 M.P.H.) average speed.

Lighter-than-air policy could not exist for a moment were people akin to men of the world in charge of affairs. As it is, we drift on, hoping and praying for a leader.

Let it be stated again—let the ghosts of the pioneers of flight state it again—the whole object and use of flight lies in extreme speed.

You can push a load of one ton, on rails, at 20 m.p.h, for one mile for 1d. (ascertained cost).

You can push a load of one ton, on rails, at 50 m.p.h. for one mile for 10d. (estimated cost).

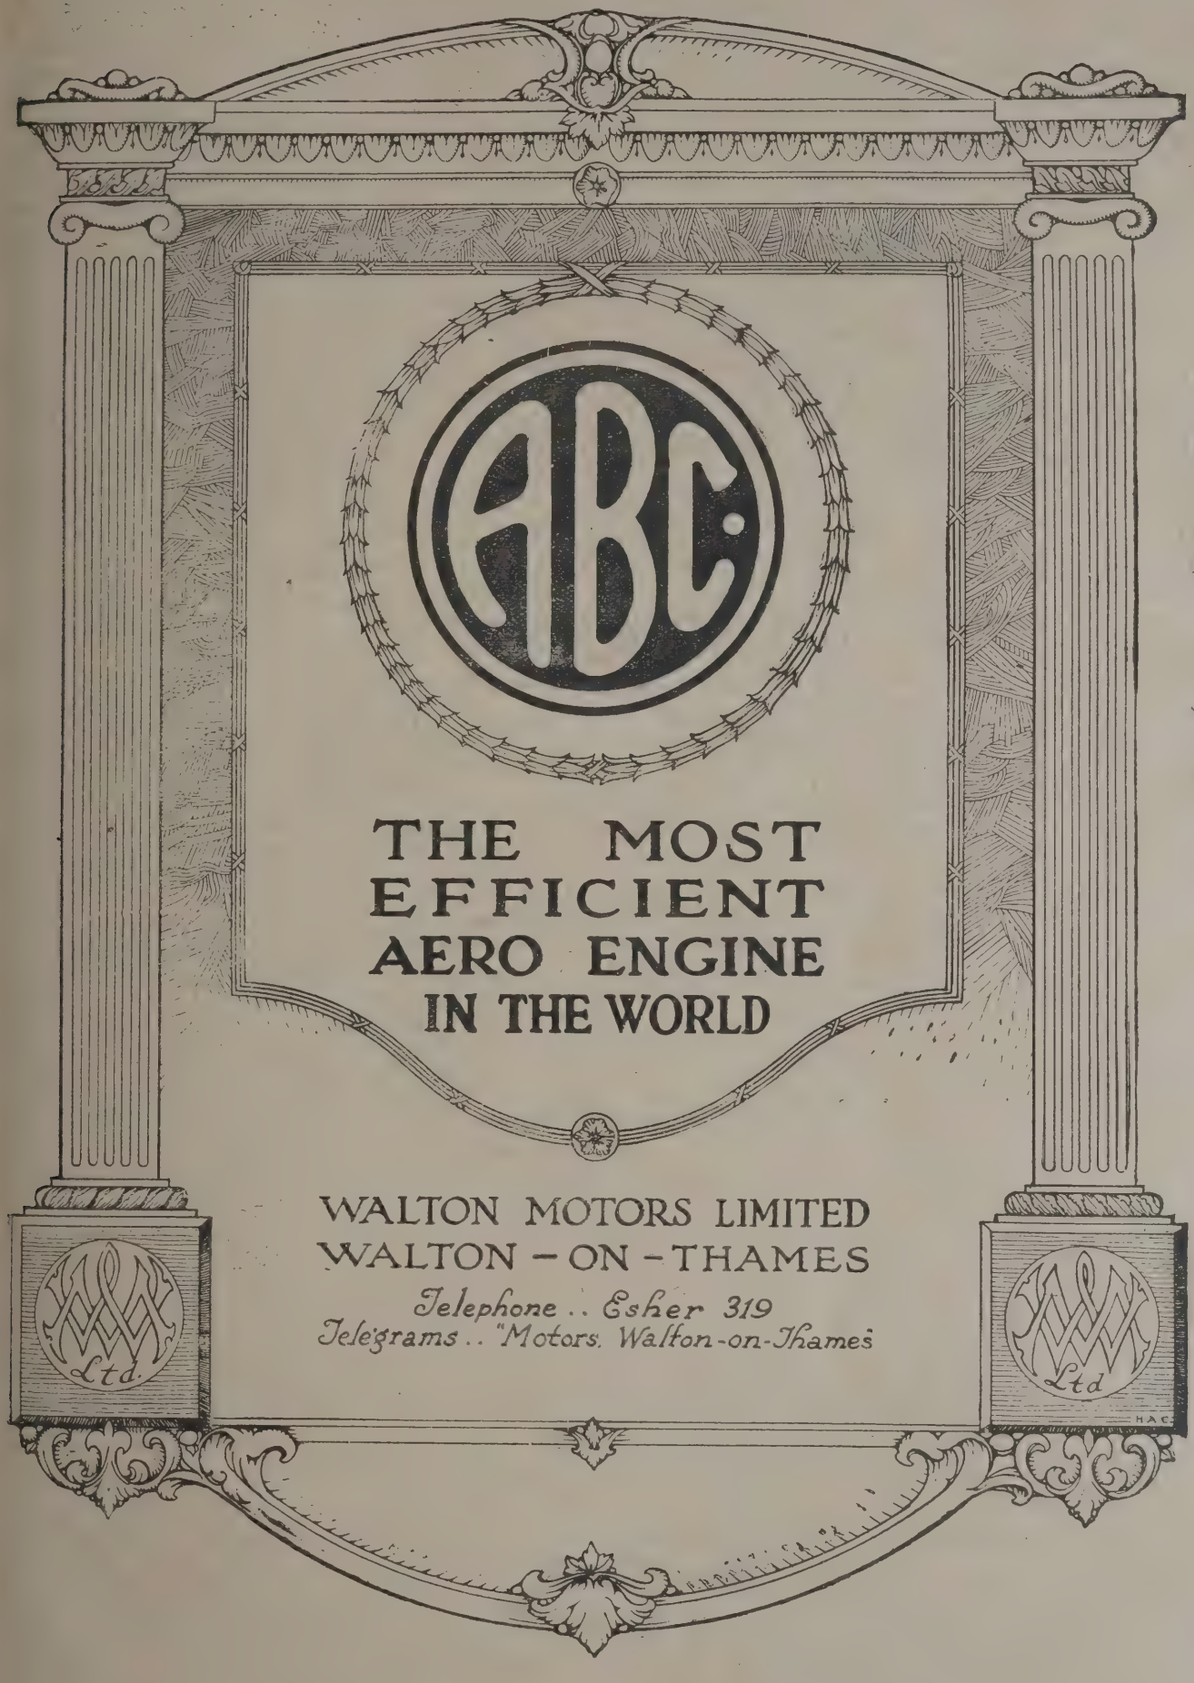
You can fly a load of one ton, in the air, at 100 m.p.h., for one mile, for 40s. (estimated) by aeroplane.

You can fly a load of one ton, in the air, at 40 m.p.h. for one mile, for 36s. (estimated) by airship.

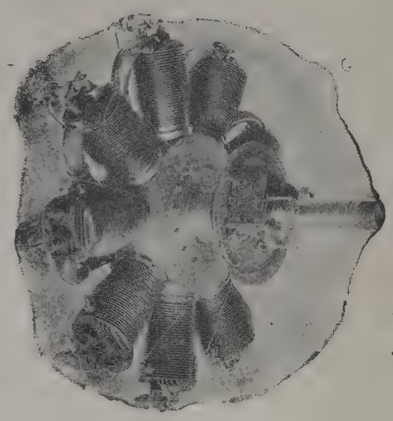
You can fly a load of one ton, in the air, at 400 m.p.h. for one mile for £100 (estimated) by aeroplane.

The conclusion is obvious. The load carried is too small, and too expensive, to be worth while from the passenger point of view, but is quite sufficient for the mail.

Mail—reduced as necessary by microphotography—is the future load, and mail carrying must be carried out by State Government.



Admitted that private firms may tender for the carriage of mails as for present G.P.O. services, but the super-control of all must come under the Air Force, and the Air Force will therefore run war and peace services at the same time.



And yet—not a word from our chiefs *re* this! Only wild statements in the Press, and no results.

Unless the matter is tackled—strongly—immediately—the new Air Force will dissolve, the public will be disgusted, and flight affairs put back half a century.

A State air mail service should be started by the Royal Air Force *now*.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

The subject of the leading article by "Strasbourg" in this issue is one which applies to a very much wider field than that of Aeronautical Engineering. It has, however, its definite bearing upon this subject, and the sting thereof is mainly to be found in its tail.

A letter from an anonymous correspondent, which complains of a practice to which "Strasbourg" has drawn attention, will also be found in this issue.

It becomes daily more and more clear that the methods adopted by British Government Departments for the encouragement of industry constitute a grave menace to the prosperity of the country.

The series of articles upon "Modern British Aeroplanes" has been interrupted temporarily in this issue. As a slight variant a page of illustrations of certain machines which are typically German in design, with a brief comment on the peculiarities, is given.

The article by M. Frantzen on French parachute systems is continued on page 435.

ON THE EVILS OF LOW PRICES.

AN ESSAY IN ECONOMICS WITH AN AERONAUTICAL APPLICATION.

By "STRASBOURG."

Great Britain has just emerged from a great war into what is—so one is assured—a victorious and a profitable Peace.

As a result, if not entirely of that Peace, at least of some of the methods employed in attaining it, the price of every commodity in the country has approximately doubled, and Industry, if not actually at a standstill, is in a parlous state.

The British were ever a feeble-minded race, and in no manner is this so plainly shown as in the effect upon them of figures.

Figures constitute the simplest and the most definite of the many forms which can be used for the expression of fact. The Briton being just sufficiently instructed to imagine that he knows what a figure means, particularly if that figure bears the prefix £, is most easily put into fear by their use.

When, however, there is question of some matter too complex to be expressed in such a simple form which needs, therefore, be talked around, he, understanding nothing, but being soothed by the sound of many voices, uttering familiar, but usually meaningless, words, willingly and of a light heart, embarks on the most perilous and speculative of enterprises.

Thus this great nation is paralysed with fear at the idea of an advance in the price of coal of 6s. per ton, having barely noticed three times that increase in the past few years, but rejoices exceedingly at the signing of a Treaty of Peace, which, were it to be enforced according to the popular interpretation thereof, would probably involve the world in irretrievable disaster.

There be those who doubt the reality of such rejoicing. To such one can only point to the worthy citizens of Luton, whose enthusiasm led to the use of their own Town Hall as a bonfire.

On the other hand, no one can doubt the reality of that fear—panic were an almost better word—which is caused by the present high level of prices.

Even in Government departments its effects have been noticed. That such effects should in the main have tended to a still greater rise is interesting, not in itself particularly curious, but may have a very definite relation to the hitherto unexplained phenomenon that this country, despite its collective idiocy, continues to prosper.

It is an old and apparently a well-substantiated belief that there is something of the nature of a special providence which watches over the welfare of drunkards and fools.

Is not the explanation merely that the efforts of such are usually so ill-directed that they produce an effect quite contrary to that which might be expected; and, similarly, may not the prosperity of this country be due to the fact that its policies—social, industrial, and foreign—have been invariably directed with idiotic intent, and invariably carried out in an imbecile manner? Thus the results produced have generally been excellent and the exact contrary to those which logically might have been deduced from the proclaimed intentions upon which those policies have been based.

A general high level of prices throughout the markets of any community may indicate one of two things.

Either there is an actual shortage of supplies, or that the community lives well, works well, earns well, and pays well. Money is cheap amongst such a community.

To a very large extent prices are high in this country and throughout the world because there is a shortage of all classes of consumable goods.

For the last four and a half years a very large proportion of the world's labour and of its manufacturing appliances have been diverted from the production of useful articles to the manufacture of goods intended either to be themselves reduced, or to reduce other goods, to smoke and ashes.

This part of the world's industry has been so effec-

tively directed that to-day that surplus over the bare needs of existence which normally provides man with those comforts and conveniences which distinguish his life from that of the brute has nearly ceased to exist.

For that shortage there is one remedy, and one only. That remedy is work—work efficiently directed to make up the past four and a half years' waste.

Provided the work is done and the goods are produced, the prices will fall—effectively if not nominally.

If the goods are not produced, or are ill and inefficiently produced, it were fatal for prices to fall.

High prices at least discourage extravagance and waste, and extravagance and waste mean merely useless production.

Low prices artificially maintained in the face of a shortage of goods can but penalise the thrifty and economical to the benefit of the wasteful and extravagant.

The Low Price Fallacy.

This country has already suffered too much from low prices. In particular it has, and still does, suffer from low-priced and nasty labour.

Low-priced labour is nearly always uneconomical labour.

Low-priced colliers, working in meanly equipped collieries in Britain, produce roughly one quarter of the output of coal per man per year which is produced by higher-priced labour in decently equipped collieries in the United States of America, and produce that quarter at a higher cost.

Low-priced labour lives—has to live—under mean conditions, and grows a mean habit of mind.

Low prices, cheap labour, and a mean-minded population all go one with the other, and this country has far too much of all three.

The lowness of prices and the cheapness of labour do, it is true, appear to be vanishing, but the mean-mindedness is not declining.

The type of mean mind from which this country has most to fear is not the mind of the striking trade unionist so much as the mind of that semi-educated class which it has pleased some power—it were irreverent to suggest the Almighty—to put into effective control of our Government, its various offshoots, our commerce, and our industry.

The herd is acutely aware of the present shortage of supplies of all kinds. To its mind, if mind it can be called, this shortage appears not as a matter to be made good by hard work and thrift, but one remediable by Act of Parliament decreeing that prices shall fall.

Our good Government, being entirely composed of people just sufficiently intelligent to choose the simpler paths of temporary popularity, ordains that prices shall fall, and makes good the resulting deficit by piling on taxation.

Thereon further yowls of anguish from the herd, alleging extravagant expenditure on the part of the Government and its departments, the which, to placate the populace, are set about economising.

Of their methods in this effort the greater number are ludicrous, but there is one such method—and it is a method from which the Aircraft Industry has suffered much—which, if persisted in, must lead to disastrous consequences.

At the outbreak of war the British Aircraft Industry was a very small affair, and the number of those who had experience in the design and manufacture of aircraft was entirely insufficient to meet the war demands of the country.

Those concerns which had such experience were set to designing machines such as were needed, producing as many of them as was possible; to supplying drawings or samples to all sorts and conditions of people who could divert their labour, plant, and tools to the purpose of making aircraft or aircraft components.

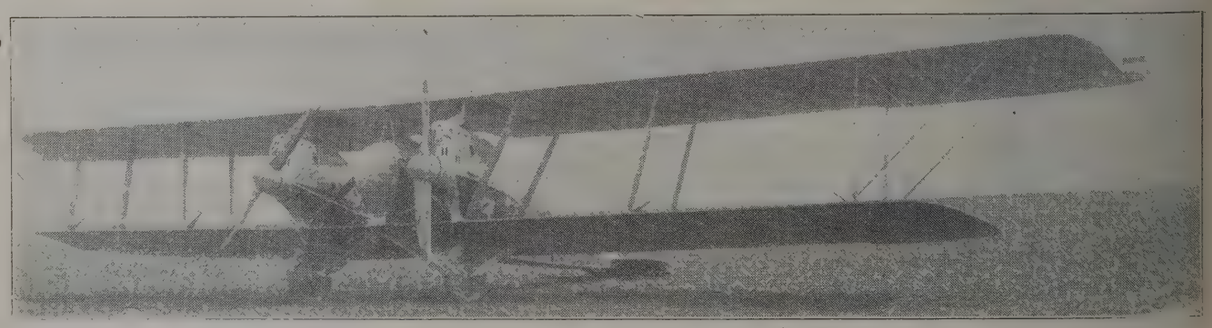
The majority of such firms were pure copyists, and, having no experience of a specialised and refined industry, it became necessary to improvise a very complicated official inspection department. Thus alone was it possible to maintain a passable standard of workmanship.

Their ignorance of all the problems and principles of aircraft construction made necessary that wonderful organisation known as the Technical Department of the Department of Aircraft Production, in order that they might be assisted over those difficulties and problems.

All such new-comers to the Industry were thus supplied, often very ineffectively, with that knowledge and experience which the pioneer firms had purchased for themselves at a cost not to be expressed in terms of cash.

This state of affairs was justifiable under the conditions of the late war. Those whose faith and foresight had laid the foundations of the Industry were rewarded—perhaps inadequately, but at least appreciably—for their enterprise.

To-day this state of affairs can no longer be tolerated.



It cannot be expected that any business concern shall maintain a competent experimental and design staff to work out those problems which must be solved if the Industry in which they are concerned is to prosper unless they are to reap some fair proportion of the reward of their own enterprise.

An Air Ministry Fraud.

The Air Ministry is at this present moment engaged in an effort to defraud such as have carried out design and experimental work of all reward for their labour.

The process adopted is simply to persuade firms to attempt the production of some machine, instrument, or appliance which is thought to be necessary.

When any such article is produced to their satisfaction, a small order is placed with the originators, and

A MODIFIED GERMAN BOMBER.—A twin-tractor Gotha Bomber showing the abolition of the front gunner-observer's cockpit. It is noticeable in this and other pictures recently reproduced that the German designers are now devoting much attention to cleanness of outline in their large machines.

Langton Road, Cricklewood, N.W.2.

Telephone: Willesden 2455 (3 lines). Telegrams: "Nieuscout, Crick'e, London."

complete drawings and specifications are called for, on the pretence that these are necessary for inspection purposes.

These drawings are reproduced, and are then issued to all and sundry who may care to tender for the manufacture of the article.

Contracts are placed on the basis, common to all mean-minded concerns, of the lowest tender.

As an inevitable result the bulk of the orders go to firms who have spent nothing upon experimental and design work, who know to a nicety how far they may venture in submitting bad work and poor materials to the inspecting authority, and who stand to lose nothing in reputation by the faulty functioning of their products because they have no reputation to lose, and, even had they, they can always disclaim responsibility for the design.

It is recorded that the principal of one firm which found itself in the act of suffering from this process laid his case before the particular official of the department encharged with the matter, and pointed out the hardship involved.

In reply the said official replied: "Well, of course, it's rather hard on you, but what would you? Business is business after all. If you go to an Oxford Street tailor and ask him to quote you for a suit, he will ask you ten guineas. If you go to a tailor in the suburbs you can get a suit made of similar material and of the same cut for five. Wouldn't you buy the five-guinea suit?"

To the parliamentary or other popular type of economist an argument unanswerable—except at the cost of votes, popularity, or the like testimonial to incapacity.

Fortunately he who was thus admonished possessed, possibly unconsciously, some truer sense of proportion, and replied: "As a matter of fact I don't do either. I go to a Saville Row tailor and pay fifteen guineas.

"What I do *not* do is to buy one first-class suit that fits me, rip it to pieces, and make patterns from it, and then have it reproduced by East End aliens of shoddy and at sweated prices."

Just as it is undesirable from the national point of view that there should be an East End populated by people of doubtful nationality, of dubious habits, sustaining a filthy existence by dint of underpaid bad work, and ever ready to initiate either a riot or an epidemic, so is it undesirable in the Aircraft and in all other industries that there should be any attempt made to reduce prices by methods which deprive the honest worker of a fair reward for work well done.

A GLOSSARY OF TECHNICAL TERMS.

Whenever a new and experimental industry gathers together into one or two colonies an assemblage of imaginative and ingenious people, it is extremely likely that that industry will within a short while improvise a specialised vocabulary.

Such a vocabulary is usually picturesque—frequently vivid—often unprintable—and always arouses the wrath of those of a pedantic mind.

The vocabulary developed amongst the pioneers of British aviation, congregated at Brooklands, Eastchurch, Hendon, and the like, was all these things and often more.

Brooklands, Eastchurch, and Hendon—as they once were—have departed for ever.

Aviation has become respectable—the leaders of the industry are now to be found ensconced in comfortable chairs in expensive offices rarely very far from Piccadilly, and it has become necessary that its proceedings should be described in terms which could not cause the readers of the "Daily Mail" to blush

It is in many ways regrettable—it is certainly less amusing; it is, however, inevitable.

A loose terminology—loose in any sense—inevitably leads to confusion of one kind or another.

This has been the case with the Aeronautical Industry to a very marked extent.

It has increased and become an important branch of engineering in far too short a time for the vocabulary of its pioneers to have settled down to definite and generally understood terms.

The publication by the Royal Aeronautical Society of "A Glossary of Aeronautical Terms" is thus an important and a welcome event. This glossary represents the labour of some years.

As far back as December, 1909, the Aeronautical Society appointed a committee to draw up a list of words more or less special to the technics of aeronautics. In September, 1914, the list issued by this committee was enlarged, and again in October, 1916, it was felt that it was necessary to extend the list still further.

The Technical Terms Committee of the Royal Aeronautical Society was thereupon appointed, and has continued its labours to the production of the Glossary now in question.

It has worked in collaboration with the Aircraft Committee of the Engineering Standards Association has been recognised by them as the Aeronautical Terms Sub-Committee of the Engineering Standards Association, and has been assisted by officials of the Air Ministry.

A member of the American Aviation Headquarters in London has acted as liaison officer between the American National Advisory Committee on Aeronautics, and generally every effort has been made to render the results of their work as universally acceptable as possible.

It is recognised that a glossary such as this can only be provisional, as only the language of a dead nation or the vocabulary of a dead industry can be fixed, and it is proposed to issue successive editions of the Glossary with improvements, extensions, and emendations as these are suggested or found necessary. The Glossary itself covers a very extensive field, and has been made to embrace all the adjuncts to aeronautics, even where these adjuncts are common to other branches of applied science.

The general principles which have guided the Technical Terms Committee in compiling this work are summed up by the Committee itself as follows:—

The compilation of the Glossary has been framed on the following basis:—

(a) The coining or creation of new terms has been avoided.

(b) Terms which though used in aeronautics have the same sense as in their ordinary usage have been excluded with few exceptions.

(c) When current usage has been lax, a term has been restricted to that employment which was either dominant or most logically defensible.

(d) Terms already in common use have been crystallised by clearly defining their application.

(e) Cross reference has been made to many colloquialisms which have a reasonably wide use, but formal status has not been given to them.

(f) An agreed series of symbols has been introduced for those mathematical calculations which relate to aerodynamics.

(g) Terms of which the meaning in aeronautics has been narrowed down to some specialised significance have usually been included.

(h) The names, used in aircraft stores, of parts and materials have been listed and defined where necessary.

(i) Meteorology and its terms have been included as a part of the science of Aeronautics.

It remains only to be said that generally the terms which have been standardised appear to be on the whole well chosen and clearly defined.

There are certain cases where improvement might be made—as, for instance, on page 44, where "small end bush" of an aero-engine is defined as "a part in the connecting rod easily replaceable in the event of wear, employed when the gudgeon pin is fixed relatively to the piston." Not only does this leave one free to apply the term to any part in a connecting rod which may be easily replaceable and which is employed under the particular conditions laid down therein, but it expressly excludes that large number of small end bushes, properly so called, which are not easily replaceable.

Unquestionably, the Glossary should have a place in the library of every student of Aeronautics.

A GERMAN RUMOUR.

It is reported from Zurich (via Paris) that certain large German firms, including Krupps, are engaged on experimental work with an internal combustion turbine suitable for aeroplanes, and that machines fitted with this engine have already been built.

If there is any foundation for this statement, it is highly improbable that the turbine employed is actually an internal combustion engine.

It is just possible that a satisfactory diluted gas or oil turbine may have been produced, in which fuel is burnt under compression in a combustion chamber into which water is injected in fairly large quantities.

This has the effect of greatly reducing the temperature of the gas flowing past the turbine blades and immensely simplifies the construction of the turbine.

SOME INTERESTING GERMAN MACHINES.

A four-engined Siemens Schuckert Biplane with 4-110 h.p Mercédès Engines.

A Linke Hoffmann Multiple-engine Biplane with engines inside the fuselage.

A Junker-Fokker All-metal Monoplane.

The pictures reproduced upon this page are typical of certain developments of German aeroplane design. The four-engined Siemens-Schuckert biplane represents one of the earliest efforts at producing a multiple-engined machine, and is largely based upon Sikorsky practice.

At the same time as this machine was being built (early 1915) the Siemens-Schuckert firm were experimenting with a number of engines enclosed in the fuselage driving airscews on the wings by gearing. Though not a Siemens-Schuckert product, the Linke-Hoffmann "Giant" is of this type—so far unexploited in any other country.

The third picture gives an excellent idea of the general features of the All-metal Junker-Fokker monoplane, devoid of all wing bracing. The corrugations in the thin sheet metal forming the fuselage, wing and tail coverings can be plainly seen. The parasol monoplane is one of the steps in the development of the Junker-Fokker type.

The All-metal Fokker Parasol Monoplane (rotary engine).

AERIAL SAFETY AND THE AEROPLANE PARACHUTE.—(*Continued*).

By L. P. FRANTZEN.

THE FRENCH ORS PARACHUTE (1918 TYPE).

The Ors parachute is 10 metres in diameter, and is made of French silk.

This parachute is folded up upon 12 circular wood frames which are attached one to another by small cords. It being so folded, the 12 frames are placed together and the suspension ropes carefully folded so as to avoid their becoming entangled.

The Ors type of parachute has two special features—(1) certainty of opening and (2) positive extension (*i.e.*, it is drawn out directly by the weight of the falling aviator).

In opening, air passes through the wooden rings and inflates the upper portion of the parachute first, the parachute opens gradually and produces a gradually increasing negative acceleration.

This type is amongst the most interesting and most certain of aeroplane parachutes.

M. Jean Ors himself has even descended from an aeroplane in one holding on by his hands alone.

TRIALS OF THE ORS PARACHUTE.

1st test. Parachute 10 metres diameter. Parachute opened gradually and with little shock, and descended at an average of 15 ft. per second.

2nd test. Parachute, 8 metres diameter, fitted beneath the body of a Bréguet biplane. Dropped at about 300 ft. The parachute opened gradually and descended at an average speed of 17 ft. per second.

3rd test. Parachute 9 metres diameter. Dropped from 325 ft. The parachute commenced to open at once, and opening was completed in 4 seconds, the upper part inflating first, and the parachute extended itself steadily to its full spread as it dropped. The opening is so slow that the shock produced is very slight.

THE JUCHMES BALLOON PARACHUTE (MILITARY TYPE).

(*Invented by M. Juchmès, Airship Pilot.*)

Description. The case containing the parachute is made of rubber-proofed fabric, and is placed at the side of the nacelle. It is in form a truncated cone, fitted with wooden rings at each end. The case is fixed to the nacelle by a pyramid of cords which terminate in two rings.

The parachute is arranged at the base of the cone, and is held in the throat of the wooden ring by a spring clip which will stand a pull of 30 kgs. There emerges from the cone only a rope 3 metres long, which is attached to the aviator's harness by a snap-hook.

Dimensions of the case:—Height, 0.60 m.; diameter, summit, 0.25 m.; base, 0.40 m. Overall length of drawn out parachute:—Parachute, 5 m. cord fans, 5 m.; suspension ropes, 8.95 m.; harness rope, 3.0 m. snap-hook, 0.05 m. Total: 22 m.

The parachute has roughly a diameter of 10 metres. It is made in five zones, made up in panels, each 1 metre wide, making a total length of 5 metres when the closed parachute is pulled out. The four inner zones are of fine silk. The exterior zone is in heavier silk, or *ponghée*, with a corded edge.

The upper part of the parachute is pierced with a hole of about 0.5 metres diameter, which is cross-tied with cords. The suspension is in the form of 8 fans each of three branches, leading to eight suspension cords.

This parachute, which has saved the lives of numerous kite balloon observers, has also been tried from aeroplanes, but although it has given some results, it does not seem to be sufficiently developed for this application.

In the technical and practical tests a diagonal system of support and an internal collar were used, but the arrangement gave too little elasticity, and resulted in too sudden an opening, although the shock was not very great.

On July 31st, 1918, Captain Aviator Sarret made a test in Lorraine by leaving a two-seater Salmson biplane from a height of 500 metres with a Juchmès parachute with no special arrangements. This exploit gained for him the Cross of the Legion of Honour.

THE "SERVICE DE L'AVIATION MILITAIRE" PARACHUTE (S.E. AE. TYPE).

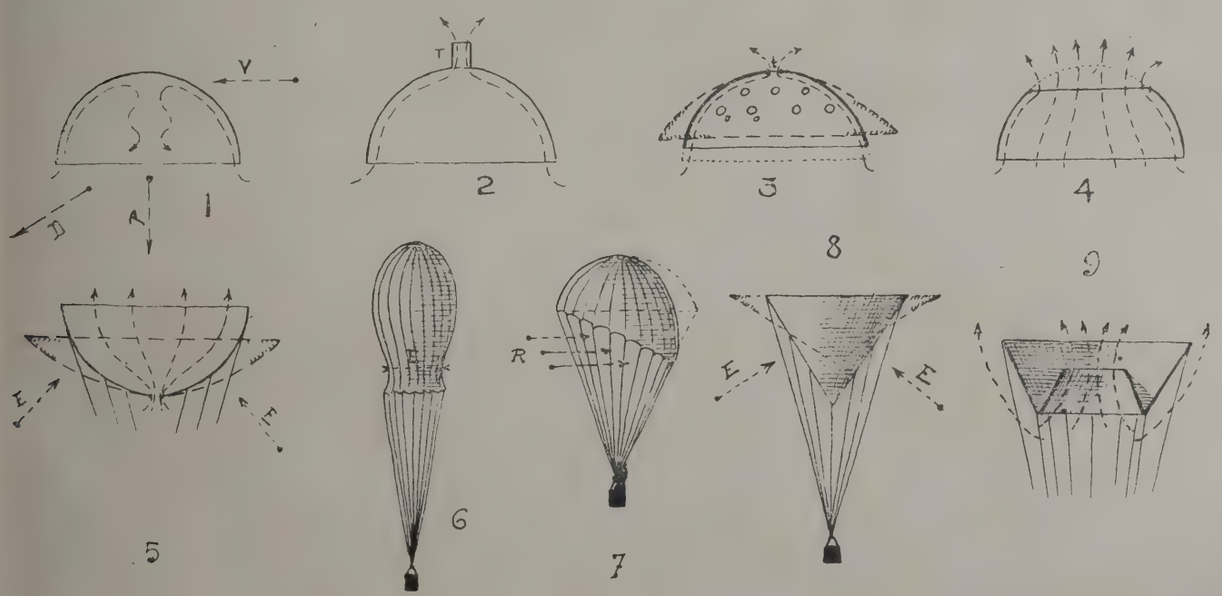
The model first tried was derived from the Juchmès balloon parachute, but a number of holes around the summit were added. These holes were fitted with an elastic device which allowed of their expanding under pressure. This arrangement was designed to halve approximately the shock of opening, but, on the other hand, it increased the rate of descent. The shock-absorbing qualities were good, but it was necessary to increase the diameter to reduce the mean speed of descent.

This parachute was 7 metres diameter, with a radius of curvature of 9 metres, and was made in 12 sectors, with 12 suspension ropes. It was made of cotton fabric, and weighed, with its envelope, about 20 lbs.

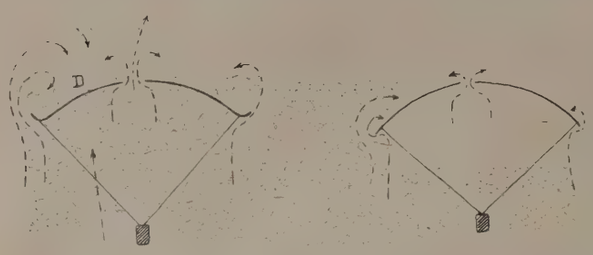
The parachute is folded accordeon-wise in a waterproof envelope. The suspension ropes are folded up in a separate compartment of the envelope. A cover is fitted to the envelope, held in place by cords.

This parachute has been tried from various heights. It was fitted in a compartment behind the observer in a Bréguet, and so arranged that it could be dropped over one side and hang just below the fuselage when the dummy or weight was to be dropped.

A dynamometer was fitted into the suspension system, which registered the maximum shock.



At the first trial the parachute dropped a long way before opening. Then it opened suddenly and with a fairly large shock. The speed of descent averaged 15 ft. per second.



As a result it underwent several modifications, and was again tried upon a Bréguet, upon which it was fitted in the same place and manner.

Launched from 150 ft., it made a bad opening, which produced a sudden change of speed and a shock which reached 1,000 lbs.

It was necessary then to make radical alterations in the system, and particularly in the suspension.

A further test was made at 600 ft., the parachute being carried in the cockpit. It was hung out over the body just before releasing

10 11

The result was bad, because the parachute fell owing to the small cords which held it in the case breaking through getting entangled in the tail, an accident which obliged the pilot to make a forced and brutal landing, thus demolishing the machine.

This has been the only accident in all the long series of tests made by the commission charged with the examination of aeroplane parachutes, but it formed a good lesson as to the precautions which must be taken in the future. It should be said that this parachute should be perfected shortly, and that it ought to be completely satisfactory.

To conclude this essay a diagram is given here of the divers forms which can be given to parachutes. The reader will be enabled to take account of the advantages and disadvantages of each system, and will probably conclude that the problem of the aeroplane parachute is still far from being settled, even in regard to the shape of parachute to adopt.

Description of the Diagram.

Fig. 1.—Primitive type of parachute. Hemispherical (inverted bowl) without hole in the top for the passage of the air current.

Disadvantage: Great pendulum oscillations due to eddies set up within the parachute.

Fig. 2.—Garnerin parachute, with "Lalande hole" (T), giving a better air flow.

Fig. 3.—Modern parachutes: Types 1: Less than a hemisphere; type 2: flattened hemisphere. The majority are fitted with a single escape hole, but some have multiple openings. These types give good air flow, but oscillate more or less, to an extent which depends on the shape and proportion of each parachute.

Fig. 4.—Hemispherical parachutes cut out too much at the top. This excessive cutting away, which greatly diminishes the surface, greatly accelerates the rate of descent, even to a dangerous extent. Also the oscillations are in no wise reduced by enlarging the hole.

Fig. 5.—Mouillard type parachute (1895). Tests made with rigid hemispherical parachutes turned upwards. Very good air flow and good sustentation were obtained. The experiment can be easily made with an umbrella turned inside out. Very little oscillation. The air reaction is shown by E.

Fig. 6.—Throttling (suction) effect (at E), which occurs with all ordinary types of non-rigid parachutes at the beginning of the fall. This may become very dangerous in a strong wind (or at a high speed), and may prevent the parachute opening at all.

Fig. 7.—Steering a parachute by shortening the suspensions on one side.

Fig. 8.—Inverted cone type parachute. Badly carried out by Cocking in 1834. An excellent shape, recognised by Sir George Cayley, and shown to be correct by Renaud, but difficult to make in practice. The descent of the inverted cone parachute is perfect, and is without oscillations.

Fig. 9.—Annular parachute, single or multiple (System A. Dauphin). Rigid or semi-rigid type.

On either theoretical or experimental grounds this is the best shape yet known, but, like the previous type, it is difficult to make.

A parachute of this shape, however dropped, automatically reverts to its normal position. It has no pendulum motion.

Further, this system, known as the "Reaction type," only needs half the surface necessary for the ordinary types, which is remarkable. This fact will be referred to again.

Amongst the types of parachute of French invention one must mention that due to M. Jean Stroescu, which is interesting on account of its turned-up edge. This inventor has obtained very striking results by making his parachutes to the profile shown diagrammatically in Fig. 10.

In this it will be seen that the air currents are more dispersed, and that a larger region of low pressure (D) is set up by the turned-up edges than is the case with the usual form (Fig. 11).

It is interesting to note that this principle of the turned-up edge is mentioned in an essay of Mouillard's upon dirigible parachutes dated 1895.

It should be remembered that Mouillard made very careful experiments with parachutes, and that he rejected in principle the Garnerin spherical or inverted bowl type of parachute, and recognised that the inverted umbrella, or "bowl right-way up," as theoretically better. But to make a practical flexible parachute of this form is a quite different affair.

The same is the case with the inverted cone type recommended by Sir George Cayley, and tried with such unfortunate results by the English painter, Cocking. It has not been possible to carry out this system yet without a rigid skeleton, which has caused it to be rejected for aeroplane work.

Nevertheless the principle is good. It is the same with the annular type of parachute devised by Dauphin.

Since Garnerin the shape of the parachute has remained practically unchanged, and it was only towards 1910 that attempts have been made to devise parachutes for aeroplanes which are automatically thrown clear of the machine.

It is correct to say that all modern aeroplane parachutes have been designed on this line. It is the author's opinion that this is not sufficient.

It is only necessary to read Mouillard on this subject. His criticisms are imperative, and to anyone who has studied in its entirety the parachute question it is impossible to accept as final the present spherical type, on account of the violent pendulum oscillations which occur during descent.

It has been extremely difficult to find suitable methods of carrying parachutes upon the various types of Allied machines in service.

In horizontal flight the matter is relatively simple, but when, as in the case in accidents, the machine may take up any position whatever, the problem becomes very difficult to solve. It has, however, been accomplished now.

The pre-war and early war trials with parachutes placed below the fuselage only met the one particular case, and could not be considered conclusive. A parachute should be always ready to operate, no matter what the conditions. The best methods ("L'Aérophile," March, 1919) in actual use are either to carry the parachute upon the aviator's back, or to place it in a special case which is carried in the fuselage immediately behind each aviator's seat.

A flat parachute (Fig. 3) produces a very decided sideways movement, a kind of glide.

A parachute too deeply curved gives rise to great pendulum oscillations.

A parachute with a large number of vent holes beside the central hole has a reduced shock when opening, but must have a large surface to prevent excessive speed of fall.

Most parachutes have been made either of silk or of cotton. Silk is incontestably the better material on account of its lightness and its strength. Silk allows of folding into a very small space, and is little damaged by being folded.

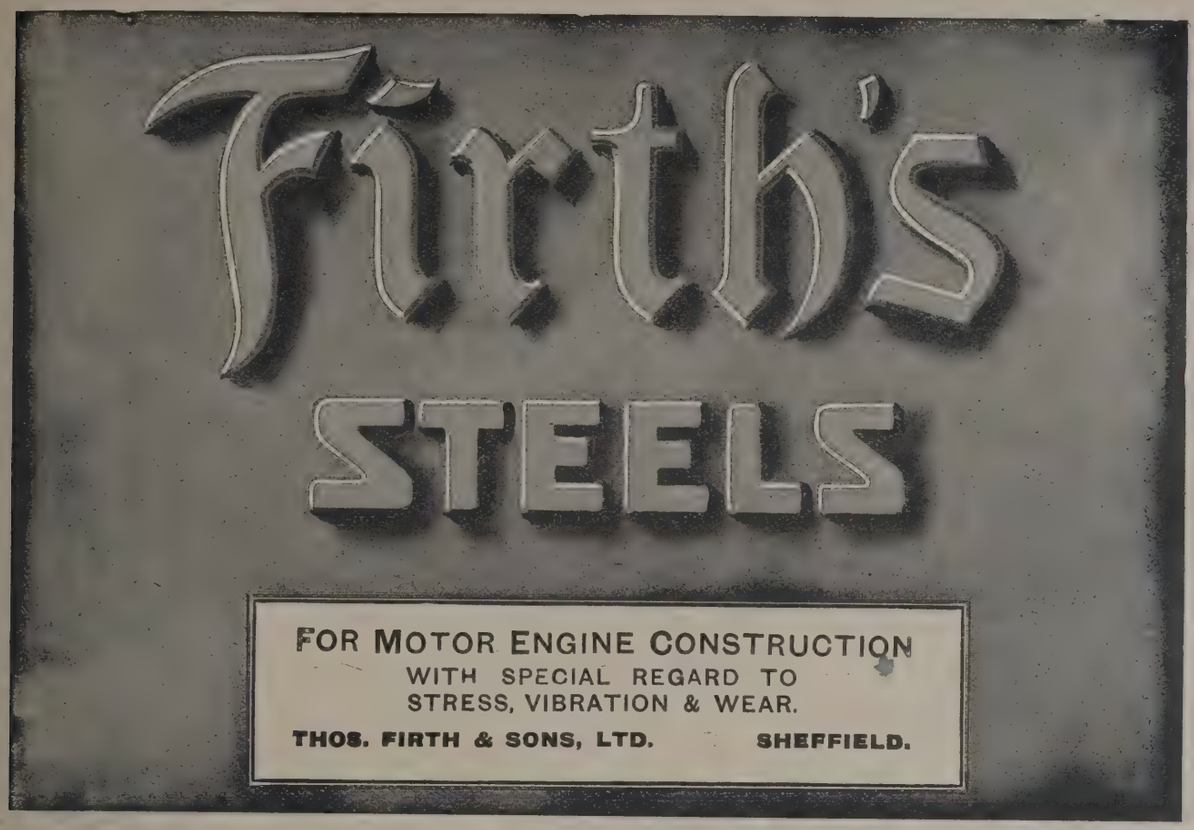
Parachutes should never be folded when wet.

Parachutes which have been used and repaired should never be used.

Parachutes which have been used and repaired and stowed very carefully. This needs in many cases a considerable time.

It is obvious that the case which contains the parachute should be fireproof. The parachute itself should be so treated. The Germans did not neglect this precaution, doubtless thinking that their parachutes might be attacked, although naturally it was the inverse which occurred.

INADEQUATE SENTENCES.



On Thursday, July 17th, at the Sheffield Police Court, W. S. Laycock, Ltd.; James Sedcole, manager of the engine department; Fred Miller, commercial manager; William Hunter, works manager; Edward Clarke, foreman fitter; and William Margerison, stores clerk, were charged under the Defence of the Realm Regulations with misleading an official of the Department of Aircraft Construction as to the quality of certain parts of an aeroplane engine by substituting for parts which had been inspected and approved by the Aeronautical Inspectorate Department certain other parts not so inspected and approved.

It was alleged that workmen were called upon to work during the night and in the absence of the inspectors to substitute defective cylinders for tested and approved cylinders upon engines manufactured by the firm and approved for delivery by the A.I.D. inspectors, and evidence was given by certain of the firm's workmen to that effect.

The defendants were convicted and fined: the firm £200 and 100 guineas costs; James Sedcole, £50; Fred Miller, £10; Wm. Hunter, £20; Edward Clarke, £2; and Wm. Margerison, £30.

A FACTORY FIRE.

Owing to the devotion of the staff, of which the majority were girls, nearly all the "spares" were safely removed from the building of Aero Coverings, Ltd., of Kilburn, on July 14th, when they had rather a bad fire. Two days after the occurrence work was resumed with full output.

"GWYNNE LONDON."

EMBUSQUE'S GRAB.

The following letter has been received :—

Sir,—We hear nowadays a considerable outcry from trade union circles demanding that certain customs and privileges enjoyed by trade unionists which had to go to the wall during the war shall now be re-introduced. Of the rights and wrongs of this question I do not wish to debate to-day, but it does seem to me—and, I should imagine, to the great majority of your readers—that, as well as trade unionists, other folk may also claim the return of their rights and privileges.

Few fair-minded men will deny that designing and inventive people during the war were subject to many hardships, particularly, for example, the more or less forcible seizing of their designs by the State, to be sub-contracted with all types of firms—good, bad, or indifferent—at the sweet will of the Government Department concerned. They were always assured that it was for the national cause and the national good, and therefore acquiesced.

Surely the necessity for this procedure is now long past. Under urgent war conditions this custom may have been necessary, and in many instances unquestionably did good, but under peace conditions I cannot see how any thinking man can see anything in it but bad. A designing firm may incur very heavy expenses in producing some new type of aeroplane, engine, or fitting, yet if this system is to go on his designs may be grabbed by the residue left in the Bolo muck-heap. He has then to enter into cut-throat competition for the honour of building at the cheapest possible rate his own choicest production against—in many instances—war firms of mushroom growth, whose only right to existence was the urgent needs of the war and the demands for enormous production and the continual surplus of orders.

Many of these firms are willing to take on work at any price to keep their organisation together, "always with the hope of something turning up," and are, of course, entirely saved the heavy expenses of a designing office, drawing staff, the frequent occasions on which the attempts to produce a design are abortive (but which have frequently resulted on further trials in a highly satisfactory production), not, of course, loaded with the heavy cost of experimental machines which often have to be scrapped in arriving at the result, or the maintenance of, or payments to, an experimental pilot.

I will inflict my opinions on your unhappy readers only by one final example, which is perhaps the most important of all. In many cases in the past where Governments have been buying in the cheapest market, some firm—whose design was its outstanding merit—continued to supply the trade (whatever it might be—engineering, shipbuilding, etc.) with their production, and sure enough, in a year or two, the supreme excellence of their production was so apparent to the Government that their production was finally purchased from this firm to the satisfaction of all parties concerned.

Under this new game of "Embusqué's Grab," as played on the "Bolo Rubbish Heap," the designs of this excellent firm would have been seized, executed by some firm which we will call "Messrs. Blackleg, Ltd.," to the worst possible limits which could be squeezed through the A.I.D., some underlying principle of the design quite ignored, and the design would have been a failure. Not only would the Government have acquired a cheap and shoddy article—which, always remember, matters very little to the gentleman whose greatest danger is that he might do a flat spin on his revolving office chair—but this very design acquires such a bad name that the unhappy firm cannot even do a reasonable trade with its own well-built article amongst its trade friends. For the sake of the spirit of fair play which one still believes is uppermost in all English hearts—whether they are trade or not—the time appears to be quite ripe for a really determined stand to be taken against this insidious form of "Boloism" at its worst.

Like other trade unionists, I do not sign this as I fear victimisation.

[Note.—The practice of which complaint is made in this letter is the subject of a leading article by "Strasbourg" in this issue. – Ed.]

RADIATORS.

At the invitation of the Motor Radiator-Manufacturing Co. a small party of the technical Press and the motor trade visited the works of the above firm.

As mentioned by one of the members of the party, "a radiator was a thing that nobody took any notice of until it began to leak," and then the words of the English language were inadequate to express one's feelings for both the radiator and its maker.

Having seen how a radiator should be made in an all-too-short inspection of the works, one feels convinced that the only radiators that do leak do not emanate from the factory in Grete, Birmingham. Mr. Serck, the enterprising proprietor of the company, started making radiators back in 1907 in Bermondsey, and from that time the business has expanded to its present state, where in a factory covering an area of something over four acres it is estimated that when in full swing 50,000 radiators can be produced per annum, as well as supplying from their own tube mills sufficient tubing for all the aeroplane and car radiators manufactured in the United Kingdom.

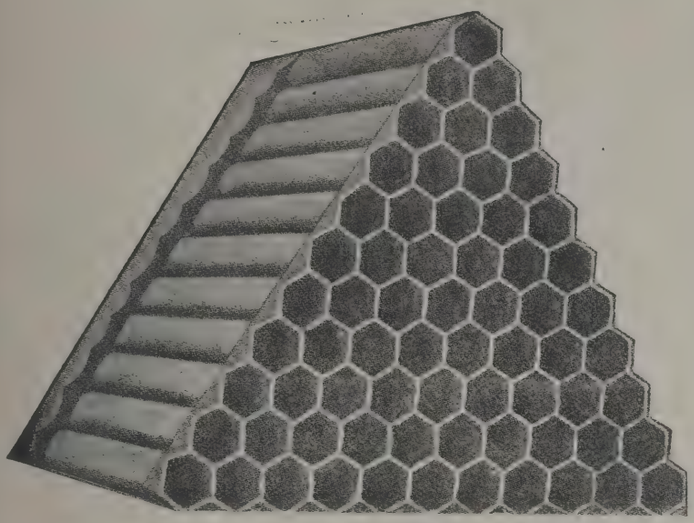
During the latter part of the war the factory was taken over as a national one and its entire efforts were devoted to the needs of the Aircraft Industry, with the exception of a contract for a certain number of Tank radiators.

In the hurried tour of the factory one saw the presses and drawing mills making the tubes from blanks, the testing of the tubes for leaks by a water test, the cutting off into short lengths, annealing, and the shaping of the ends.

The finished radiator tubes are then assembled in frames ready for the soldering process, both sides of the radiator block being submerged to a depth of about 3-16ths of an inch in an acid bath and then in the solder.

The water spaces are then connected up and mounted ready for the final tests.

In the first test the whole radiator is submerged in water and blown up with air to detect leaks. In the second it is filled with water to a pressure of 7 lbs. In the third, known as the flow test, the water is forced through the radiator in order to detect any obstructions, etc.



It is again filled with water to a pressure of 7 lbs. and is then ready for packing and dispatch.

Now that the factory has been released by the Government, Mr. Serck has again assumed control, and one feels confident, having seen the thoroughness and keenness he displays in turning out the best article only, that he is going to improve on his old reputation if that be possible, more particularly in quantity production.

A GERMAN CURIOSITY.—A Twin-engined Schütte-Lanz Biplane of early 1915. It is apparently built almost entirely of metal. The engine and airscrew mounting is of particular interest.

YOU MUST HAVE AN EFFICIENT AND RELIABLE RADIATOR.

COMMERCIAL AERONAUTICS & CIVIL AERIAL TRANSPORT

MEN OF LITTLE FAITH.

By "MEDWAY."

"What Horace says is,
'*Eheu, fugaces*
Anni labuntur, postume, postume.'
Oh, for the years that are lost to me, lost to me!
Now, when the folk in the dance point their merry toes,
Sighing, I murmur, '*O mihi, preteritos!*'"

I believe this to be a perfectly good quotation from "The Ingoldsby Legends," but as I am depending on my unpelmanised memory it may be a little loose in details. Anyhow, it has the proper classical aroma, and the moral is above criticism.

I have put it at the head of this page mainly out of deference to the example of C. G. G., who, in a recent leader on "The Writing on the Wall," referred poetically to the casual behaviour of Daniel when called upon to act as a court interpreter. Daniel has been honoured by the attentions of more than one poet; for instance, of the gentleman who wrote:

"Daniel in the lion's den,
The lion as tame as a spaniel;
Daniel didn't care a damn for the lion,
Or the lion a damn for Daniel."

By which I mean to imply that I am not concerned with any question as to whether my opinion coincides with that of C. G. G., though he may take his choice between the parts of Daniel and the lion. I recommend to him the former, who was, I am credibly informed, a major prophet. On the other hand, I would back the lion in a disagreement without gloves.

Method in His Madness.

First and foremost, I venture the view that the British aircraft manufacturer is not such a red-corpuscular vital-serumy fool as he looks. There is method in his madness. If he will not lay his shirt on the commercial feasibility of an aerial service between Lapland and Timbuctoo, it is not because he shirks the job of convincing others, but rather because he cannot convince himself.

In some ways we are a modest nation. We underrate ourselves and our products. I have an uncomfortable feeling that, when I recently suggested a full-blown propaganda department in the interests of Commercial Aeronautics, I started at the wrong step. I am inclined to think that the first thing needed is to make the Industry itself feel perfectly certain that it is on a good thing. There is a curious strain of honesty running through even the best business man among us. We are no good at pushing a thing we don't believe in. Once our belief is sure, we go to the other extreme. We know that we are a stupid nation, and we argue thus:

"If *I* can see it, it must be obvious. Any fool can see it. In that case, why bother to tell him."

And we lie down on the backs of our tummies, waiting for orders that never come.

The Second Stage.

This, however, is the second stage, when we are sure that we, and the things we have to offer, are right. As yet I feel certain the Industry is not through the first stage. It cannot believe in its own achievement, and, until it does, it cannot force belief upon others. It recognises that it has created a fine weapon of war. It is not so sure that its sword can be beaten into a ploughshare and its products modified to form a really valuable weapon of peace.

There are a few men in the Industry who *know*. Others, who hesitate to share their instinctive knowledge, are prone to regard them as unbalanced enthusiasts. The pioneers become annoyed by the atmosphere of half-contemptuous tolerance, and are driven to extremes. Then they go too far, claim too much, and end by setting the open-minded man against them. The magnificent aerial performances over the Atlantic have had just the effect that I feared and anticipated. They have caused a swing of the pendulum in the wrong direction, due to a somewhat sudden and general realisation of the amount that we have yet to learn. The more we know, the more we appreciate the gravity of the difficulties that lie ahead, and the less are we disposed to take commercial risks.

This is why I am so much more certain of the great future of commercial aviation than are many of the men whose business it is to build and sell aircraft.

A Good Salesman.

Now the first essential of a good salesman is confidence. He must have it and convey it. He will then have gone a long way towards ensuring the subsequent success of the thing sold. The buyer starts by believing in it implicitly. If he has trouble, he then ascribes the fault to himself rather than to the machine. He studies it carefully to avoid further mistakes in the future.

On the other hand, if he is wheedled into buying something in which he has no faith—because the salesman himself never had any—the first failure will convince him of his own folly and tend to make him cut his losses and give up trying.

It takes a born politician, or some other inspired liar of almost equal calibre, to instil faith that he does not possess. The British business man certainly cannot do so. The first thing, then, is to stiffen our own beliefs and cultivate a consummate confidence in the future. By consistent effort, it is possible to train oneself to believe almost anything. In the case under consideration, no great effort should be needed, because there is really so much to be said for the proposition.

I admire the man who will not glorify his own wares at the expense of others, but no one admires the man who lacks confidence in his own utility. Nothing big was ever pulled through by people who believed that it could not be done.

The case is straightforward enough:—

Commercial aerial services will undoubtedly be a big factor in the future of the world's transport.

We can build machines and engines unexcelled by the products of any other country.

We have magnificent experience at our backs.

We led the world in the development of rail and ocean transport.

We have a scattered Empire crying aloud for improved communications.

We are an engineering and a pioneering nation.

We can start fair in the race for the world's trade in aircraft.

We have a heaven-sent opportunity of showing that when a British industry is not stupidly handicapped it can hold its own with anyone.

The Handicap.

The handicap we have most to fear is one of our own making. We can wait for others to prove that traffic can be built up to render aerial services commercially successful. If we do, we shall then have the doubtful pleasure of watching those who took the risk reaping their reward, and, as Horace, with the assistance of Barham, has pointed out, we shall watch people doing the Monkey Search (or whatever the dance of the period may be) while we lament the "fugaces anni" that "labunted" while we were making up our minds.

The first step towards success is, then, to put our backs into the job. To my mind, the next steps are largely in the nature of intelligent propaganda, prefaced by the lynching of a few obstructive officials.

I must warn my readers that I have not done with this subject. In fact, I have only just begun it, and, whether they like it or not, I intend to elaborate some of my ideas on the subject of propaganda in subsequent articles.

AERODROME LAY-OUT.

By Captain M. G. Kiddy (late R.A.F.), Assistant Secretary, The Society of Architects.

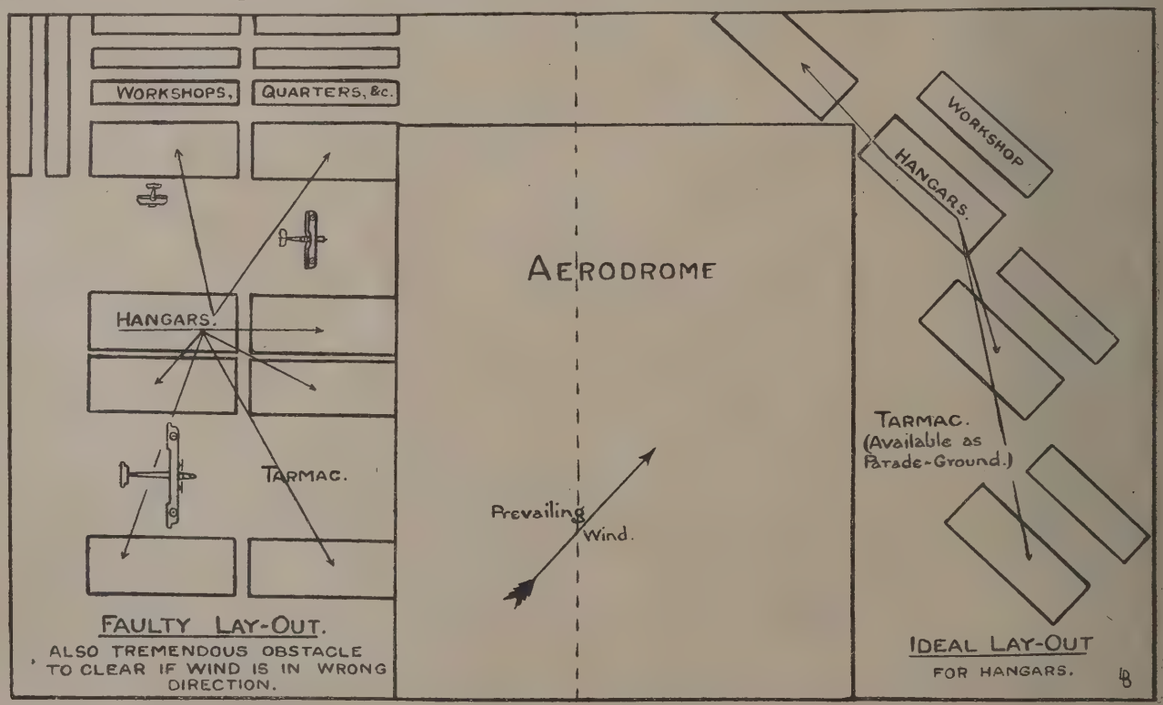
Some of the illustrations for Aeroplane Hangars which one sees in contemporary papers are, from the point of view of impossibility, rather amusing. In one of them the Hangar, a tent-construction of the "Bessonneau" type, is shown in the middle of the aerodrome, with both sides open. One Handley Page is depicted in the act of landing into the hangar from one end of the aerodrome, whilst a second "takes-off" from the other side of the hangar, executing an alarmingly quick turn on the ground as it does so.

This might be feasible if the wind were considerate enough to remain consistently in one direction. Aviators know, and architects desirous of facilitating the quick landing and getting away of machines should learn, that an aeroplane rarely leaves the ground or lands in the same direction for two days running, the direction being governed by the quarter from which the wind is blowing. "Side-slip" and "stunt" landings are no longer possible under the new Air Ministry Regulations for the control of Civil Aviation.

Artistic but Not Practical.

The bird's-eye view of the aerodrome lay-out, whether imaginary or not, which generally accompanies the illustrations is often good from an artistic point of view, but not from that of the aviator. The position of the offices, dwelling quarters, etc., is of comparatively secondary consideration in planning the lay-out of an aerodrome, though it is naturally more convenient to have them, particularly the workshops, in as close proximity to the hangars as possible. But it is the hangars themselves that matter. In typical illustrations they are built in several parallel rows, face to face and end to end, with the edge of each row of hangars against, and at a right-angle to, the edge of the meadow-surface of the aerodrome.

This would mean that all the machines would have to be man-handled to and from their sheds—a state of affairs that would cause an R.A.F. commanding officer to tear his hair! An aeroplane, particularly of the twin- or multi-engined type, takes a great deal of man-handling, any number up to twenty men being required to move the ordinary twin-engined Handley Page; and this is a waste of power, to say the least of it. In addition, the machines in the sheds farthest from the edge of the aerodrome would have to be wheeled along some 200 yards of the tarmac before reaching the freedom of the meadow.



An ideal lay-out, from an aviator's point of view—which is the point that matters—must include hangars every one of which opens directly on to the meadow-surface of the aerodrome, so that machines can leave the sheds under their own power, with a minimum of man-handling, and can then taxi straight away preparatory to "taking-off."

The Things that Matter.

Practical considerations are of first importance to the average aviator, but there is nothing to prevent an artistic lay-out with the hangars in the proper position. Too much importance cannot be attached to the latter consideration, even if, as is the case in the majority of aerodromes, two sides of the meadow are taken up by the sheds. And the lower the hangars, and the flatter the roofs, the better will the pilots be pleased. One has known personally pilots who have been killed by gables on the roofs of hangars, where a flat roof would have saved both pilot and machine.

Another point worth noting is that, where possible, the row, or two rows, of hangars should open into the prevailing wind, so that nine days out of ten the machine can fly straight from its shed into the air, with no obstacles to pass over before it gains height. This has additional recommendations, such as facilitating the "running-up" of engines into the wind, without turning machines round, and similar technical details.

In the opinion of the writer, an ideal aerodrome in every respect is that at Catterick, in Yorkshire.

ROYAL AIR FORCE

AIR TOUR AND TRAVEL IN THE NORTH.

The Avro Company's air lines are developing rapidly up north. Starting in May with stations at Blackpool and Southport, the company has now opened landing grounds at Windermere (seaplanes), Morecambe, Fleetwood, Liverpool (Waterloo sands), Rhyl, and Douglas (Isle of Man). Six other air stations are in course of formation, which will make it possible for most people in Lancashire to travel by air to the South or West of England without long journeys to Government aerodromes.

The table below shows the distances by train between well-known points, and the distance *saved* by going by air is shown alongside each :—

	Train	Air	Train	Air	Train	Air	Train	Air	Train	Air	Train	Air	Train	Air	Train	Air	Train	Air	Train	Air
Blackpool ..	—		9	1	89	26	33	13	81	19	48	20	49	8	130	39	35	15	18	3	33	21
Fleetwood ..	9	1	—		92	32	24	10	84	23	51	15	52	8	123	38	28	16	21	4	34	16
Harrogate ..	89	26	92	32	—		70	18	18	4	93	21	61	14	50	8	74	19	71	21	86	21
Lancaster ..	33	13	24	10	70	18	—		65	11	51	5	52	16	99	26	4	1	22	1	36	6
Leeds ..	81	19	84	23	18	4	65	11	—		75	10	43	7	68	13	69	14	63	15	76	15
Liverpool ..	48	20	51	15	93	21	51	5	75	10	—		32	2	143	35	35	9	30	3	20	4
Manchester	49	8	52	8	61	14	52	6	43	7	32	2	—		111	24	56	8	31	3	35	1
Middlesboro'	130	39	123	38	50	8	99	26	68	13	143	35	111	24	—		103	28	120	38	135	38
Morecambe	35	15	28	16	74	19	4	1	69	14	35	9	56	8	103	28	—		29	9	54	24
Preston ..	18	3	21	4	71	21	22	1	63	15	30	3	31	3	120	38	29	9	—		15	1
Southport ..	33	21	34	16	86	21	36	6	76	15	20	4	35	1	135	38	54	24	15	1	—	
	Blackpool		Fleetwood		Harrogate		Lancaster		Leeds		Liverpool		Manchester		Middl'sboro'		Morecambe		Preston		Southport	

This chart is most instructive, as it illustrates that there is a great saving not only in distance, but also in time, to be obtained by air travel as against the railways.

Business in joy flying at Blackpool and Southport has been well maintained, the outstanding features of the week being the visit of Alderman A. Parkinson, J.P., M.P., Mayor of Blackpool, and Mr. Little, Vicar of Blackpool, to Bolton by air, where they addressed meetings and returned to Blackpool by air.

Another interesting event was the flying of an entire wedding party of guests, bride, and bridegroom and best man at Southport. Altogether fifty people were flown after the wedding breakfast, and this in spite of clouds and mist within a hundred feet of the ground.

Another novelty was the flying from Southport in an "Avro" experimental scout of a pilot who appeared from his machine at the dinner party to Sir John Alcock, K.B.E., D.S.C., at Manchester aerodrome, having come over already dressed. He flew back between 10 and 11 p.m. in the same garb.

The "Avro" seaplanes are now installed at Windermere, Capt. Pixton, one of the pioneer pilots of the early days, being in charge there.

THE CENTRAL AIRCRAFT COMPANY AT NORTHOLT.

The one drawback to flying from London to another town or to the Continent is that one has to journey so far out of London before reaching an aerodrome. The Handley Page aerodrome at Cricklewood is probably the nearest and the easiest to get to from town, but even they cannot advertise that buses, trams, and trains stop at the door, although both buses and trams can be found just round the corner.

The Central Aircraft Company, whose works are at Kilburn, tried without success to start an aerodrome at Wembley and at Preston Road, both fairly accessible spots, but neither suitable nor possible for some reason—the latter place on account of a right of way over the ground.

They had to go farther out, and are now established at Northolt and have two hangars on the R.A.F. aerodrome there. Northolt Aerodrome is certainly more accessible than Hounslow Aerodrome, as a good service of trains is run to Ruislip from Baker Street (Met. Rly.), but the station is a good way from the ground. There is also a service from Marylebone and Paddington to Northolt Junction, but it is by no means good, although the station is within a few minutes' walk.

The aerodrome is very large, with an area of 350 acres, but the surface is very bad in parts, as the land was once ploughed, and the furrows make taxying a very bumpy business. However, a large stretch of cinders has been put down and all who can do so take off from and land on it.

The C.A.C. School of Aviation is under the personal supervision of Mr. Herbert Sykes, O.B.E. The school machine is the C.A.C. tractor biplane, an excellent instructional machine, fitted with an 80 h.p. Renault engine, and in appearance similar to the D.H.6. Later machines will be fitted with 100 h.p. Anzani engines. Although this machine was built in April, the Air Ministry have not yet sanctioned it as a passenger-carrying machine, and consequently it cannot be used for that purpose or for instruction. The Civil Aviation Department, like most other Government departments, keep so busy making other people fill up forms that they never have time to do the real work that is required of them. Already Germany has beaten us in getting civil aviation properly started: could we not borrow some of their organisers?

Passengers are being carried at Northolt in two- and three-seater Avros fitted with 110 h.p. Le Rhone engines. The Le Rhone engine is one of the sweetest rotaries in the world, when looked after by good mechanics and flown by good pilots, but some of those at Northolt did not run very well, and they have had rather bad luck with engine trouble, which is possibly due to bad treatment of the engines in the R.A.F. before they were demobbed.

An eight-passenger machine is being assembled at Northolt, and two others are being constructed at the works in Kilburn. This first machine should be ready in about a week. It is of a very solid design and fitted with two 160 h.p. Beardmore engines. The factor of safety is said to be 10.

Very delightful flights may be had over London from Northolt in the Avro machines, for which tickets can be obtained at the Lepaerial Travel Bureau in Piccadilly Circus, and at the aerodrome. As soon as the Government sanction the C.A.C. biplane the school of flying will start. A pupil is guaranteed his certificate for £125 with not less than 10 hours' actual flying, and he can also go through the works at Kilburn. He will be well taught, and leave the school knowing how to fly and knowing as much about the machine as he cares to learn.

AN AERIAL BOOKING AGENCY.

As is natural for a firm interested in travel and transport problems, who are far-seeing enough to appreciate the possible uses of aircraft, the Lep Transport and Depository, Ltd., of Castle Street, Long Acre, W.C.2, who were originally a branch of a well-known firm of shipowners and subsequently became an important and well-known transport agency under the above title, have opened a branch known as the Lepaerial Travel Bureau, in Piccadilly Circus, W.

Here they are acting as agents for Handley Page, Ltd., and have secured a large number of available seats throughout the season, with preference in the bookings of both passengers and cargo.

They are also acting as agents for practically all concerns who are running any form of civil aviation transport.

A very ambitious scheme is on hand for putting into operation as soon as circumstances permit. It embraces not only Great Britain but also the Continent, and as far as goods and merchandise are concerned the firm are prepared to collect goods from the factory door and deliver them by the recognised air routes and thence by either rail, sea, or van to any destination.—L. L. B.

Capt. Sir John Alcock K.B.E.; D.S.C.

unreservedly endorses the manifold advantages of

BURBERRYS CARAPACE AIR-SUIT

Illustrated Catalogue & Patterns Post Free.

"I am writing to tell you how very satisfactory the outfit has proved which I ordered from you for the Atlantic flight.

"Although in continual mist, sleet, or rain, and the altitude varying from 200 to 11,000 feet, causing great variation of temperature, I kept as dry, warm and comfortable as possible under such conditions.

"This was a wonderful achievement even for 'Burberry,' especially considering that I never adopted any electrical or other artificial means of heating, and that no rubber is used in your waterproofing.

"I feel you are entitled to know how pleased I was with your airman's dress."—J. ALCOCK, Capt., D.S.C.

Burberry Carapace Air-suit A thoroughly practical one-piece overall suit that protects the airman from head to heel. Provides a wealth of luxurious warmth and comfort under the severest conditions.

Flying & R.A.F. Kit in 2 to 4 Days or Ready-to-Wear.

Every Burberry Garment is labelled "Burberrys."

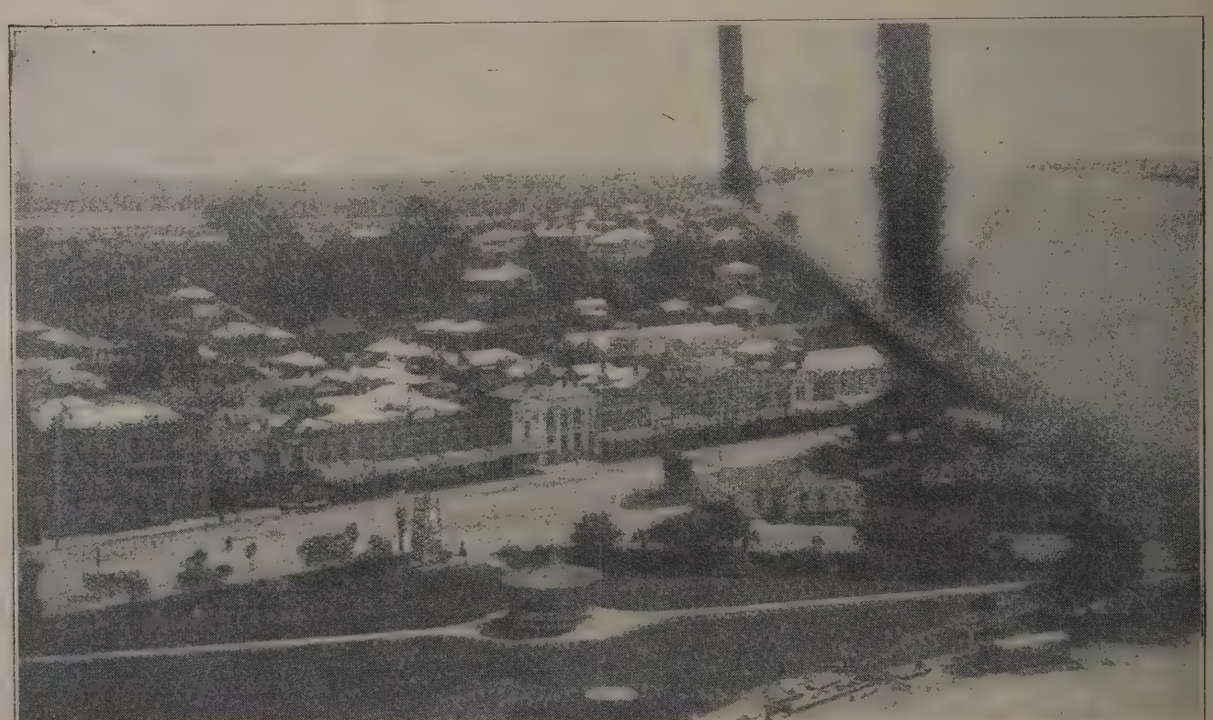
TRAINING IN ITALY.—The Gabardini School in being at Cameri.

THE GABARDINI EXHIBIT AT MILAN.

Gabardini, of Cameri, whose company is sometimes, but rarely, called the S.P.I.D.A., as most people prefer to honour the pioneer by his own name, has a most interesting collection of small vehicles on view. The well-known and abnormally unbreakable school monoplanes are, however, quite put into the shade by the tiny biplane of 2½ metres span and 9 sq. metres spread which weighs 250 kilos. with 50 radial motor, and does 140 kilometres the hour, and is, as are the two bigger biplanes, of "semi-rigid" (if one may borrow the term) steel construction. A factor of safety of 15 is claimed for the miniature 'bus, which certainly looks as hefty as anything one has seen. To some extent the claim is borne out, too, by the low percentage of fatalities in this, the oldest and, I believe, the busiest, of the war schools. As well as the other biplane machines, which in common with the above have a skid so far forward of the tail as to be nearer the centre of gravity than anywhere else, one is shown the "stuffed" monoplane or "the embalmed one" as it is called in the vernacular, which appears to be on a jointed shaft fixed into a cemented platform, and is reminiscent of certain internally-perturbing country fair machinery productive of artificial mal-de-mer, but is intended merely to initiate beginners into the hang of levers and stability. Landini, the Cameri chief pilot, shows, too, a tiny foot-steered cycle-car, also to accustom pupils to foot-control without wasting the instructor's time. This idea I heard being warmly applauded by old teachers who appeared able to judge of its economy and utility.



EXTENSION LADDERS.

In building big airships, such as the R.34, special ladders have to be used. Merryweather and Sons, of Greenwich, make a special design of self-supporting extension ladder, reaching to a height of eighty feet or more, which is used to facilitate access to any part of the envelope of the airship. These ladders are supplied to the British Government, and have also been adopted by the United States Government.

A RING SHOCK ABSORBER.

A patent shock absorber ring is now being manufactured by Messrs. Luke Turner & Co., of Leicester, and is already in use upon some of the best-known makes of machines.

The ring is constructed in a manner similar to the ordinary shock absorber cord. Besides the obvious ease of fitting and replacement, it is claimed that they offer a decided saving in weight and cost, and that a ⅞ in. cord will carry a load of 3,000 lbs. at 75 per cent. extension.

FLYING IN NEW ZEALAND.—Auckland, N.Z., photographed from one of Walsh Bros.' flying boats.

CIVIL AERIAL TRANSPORT NOTES.

GREAT BRITAIN.

Passengers are being taken up in Avro aeroplanes by A. V. Roe and Co., Ltd., at the following places:—Hounslow (London), Manston (Margate), Southsea, Weston-super-Mare, The Ladies' Mile, near Patcham (Brighton), Swansea, Blackpool, Southport, Fleetwood, Morecambe, Rhyl, and Waterloo Sands (Liverpool).

Seaplanes are on passenger service at Paignton (Torbay), and at the following towns on the Isle of Wight:—Cowes, Ventnor, Sandown, Shanklin, and Ryde.

FLYING TO THE RACES.

During the races at Goodwood and Brighton, Avro aeroplanes will carry passengers to those places

THE RAILWAY STRIKE AND THE STAGE.

When the railway strike threatened to hold up everyone going north Mr. Sydney Bransgrove, a touring manager going to Edinburgh with a new comedy, tried to arrange for the transport of his whole company from London to Scotland by aeroplane.

He approached one of the big flying companies, but as the terms were £56 per head for a company of twelve, £672 in all, the project was abandoned.

A BUSINESS FLIGHT.

A highly commendable effort has been made by the "Financier" to demonstrate the utility of the aeroplane in commerce.

Mr. H. A. C. Ponsonby, of the "Financier," was representing the paper on the trip which was organised by Capt. Greig (late R.A.F.), of the Aircraft Manufacturing Company.

With Mr. M. D. Manton as pilot, they started from Hendon on July 21st on a D.H.9 machine, and arrived at Eastleigh in 52 minutes.

At Southampton, the Supermarine Company were interviewed. They then flew to East Cowes, where Mr. Ponsonby interviewed the Gosport Aircraft Company, J. Samuel White and Co., Ltd., and S. E. Saunders, Ltd.

On July 22nd they flew to Filton (near Bristol) from Cowes in 59 minutes, and at Bristol viewed the works of the Cosmos Engineering Co. and the British and Colonial Aeroplane Company.

On July 23rd they reached Coventry in the evening and visited the Armstrong-Siddeley Motor Company, the Daimler Company, the Standard Motor Company, and Humber, Ltd.

On July 25th they flew to Birmingham, after interviewing a large number of firms.

On July 26th they flew from Birmingham to Derby to visit the Rolls-Royce Works, and then returned to town, taking 65 minutes on this last journey, arriving at 4.30 p.m.

The total distance covered was 408 miles, and despite generally unfavourable weather and bad visibility throughout the flight after the first day, this flight was made to time.

An average speed of 100 miles an hour was maintained on the various journeys.

Mr. Ponsonby received from all the firms he visited many congratulations on the enterprise of the "Financier."

BIRMINGHAM.

Civilian flying started at Castle Bromwich on Saturday, July 19th, through the initiative of a number of private individuals, who have obtained an "Avro" three-seater. Despite the counter attraction of peace celebrations in Birmingham, quite a dozen people were taken up. Weather permitting there will be flying daily from 2 to 7 p.m.

BLACKPOOL.

Upside-down flying for a first experience in the air is the record of one of the Avro passengers at Blackpool last week. The passenger was a grey-haired man of 50 years who ascended with Capt. Hinchliffe, D.F.C., A.F.C., whose machine was watched critically by the crowd on the aerodrome. The Avro climbed higher and higher, then it made a half-roll, turned on its back, and began a long downward flight upside down The pilot turned the machine as easily as if it were right side up and then made a good landing. The passenger was surrounded by friends anxious to hear his experiences. He told them it was not so alarming as he had expected, but the pilot's account was rather more lurid.

The daily service to Manchester is beginning to pay its way. More and more passengers are availing themselves of the air journey to the coast. The service has run daily for close on three months without even a forced landing to disturb the even tenour of its way, and there is every hope that August will prove a record.

The time-table of this service reads as follows:—

Leave Blackpool daily (Sundays excepted) . ..	– Noon.
Arrive Southport	12.15 p.m.
Arrive Alexandra Park, Manchester	12.45 p.m.
Leave ,, ,, ,, ...	2. 0 p.m.
Arrive Southport	2.30 p.m.
Arrive Blackpool	2.45 p.m.

The fare is £4 4s. single and £9 9s. return.

Blackpool has excelled all records. Over 1,000 passengers have been taken up this week. The weather has been perfect, and the tides have not interfered with flying.

It is to be noted that although the North Country coal miners are quick enough these days to prove how very badly paid they are, yet they can find the necessary money for pleasure flying. Some of the most frequent and regular visitors to the Avro Company's aerodrome at Blackpool are the coal miners, who appear to think nothing of paying quite large sums for a really long flight, and willingly pay the extra money charged for "stunting."

HAMBLE.

After winning the 20-mile handicap at Hendon on Saturday, July 19th, at 77 m.p.h., Capt. Hammersley flew the Baby Avro back to Hamble.

The second twin-bomber fitted with A.B.C. engines was flown over to Martlesham Heath last week to be handed over to the R.A.F. Leaving Hamble just before 4 p.m it reached its destination by 5.30 p.m. The course taken was by Winchester, Basingstoke, London, and Chelmsford.

One of the standard type Avros is being sent to Spain and is painted with the national colours of that country. With red wings and yellow fuselage, it looks quite cheerful.

Mr. A. V. Roe has just returned from a fortnight's holiday at Ventnor. During his absence he kept in touch with the Hamble works by seaplane.

LONDON.

HENDON.—Miss Madge Saunders, the leading lady in "Going Up" at the Gaiety, is learning to fly at Hendon. May she not shut her eyes when she starts to sway.

EDUCATING LANCASHIRE.—An Avro giving demonstrations of landing during the Flying Carnival at Birkdale.

Owing to the better weather on Saturday, July 26th, the attendance at the London Aerodrome, Hendon, was rather more than usual. A 20-mile cross-country handicap took place for the Hendon Trophy and a prize of £20. The race was won by Major Draper on a Bat "Baboon." Major Draper, who received 37 secs. start, finished the course in 15 mins. 41 secs (handicap time). Major R. H. Carr, on an Avro biplane, started 19 secs. before Major Draper and finished 1 sec. behind.

During the afternoon free flights in connection with the late Victory Loan were given by the Airco pilots, Capt. H. J. Saint and Capt. C. Shaw. Persons who had found certain discs dropped from aircraft during the last three days of the Victory Loan campaign were eligible for these flights, the only condition being that they had invested £1,000 in the Loan. The type of machine used was a converted D.H.4.

A twenty-mile cross-country race will be held on Saturday, August 2nd, for the London Aeroplane Trophy, over a course round the aerodrome pylons and a point about tw miles to the north of the aerodrome enclosure.

Special flying displays and passenger flights will be given on the afternoon of Sunday, Aug. 3rd.

On Bank Holiday (Aug. 4th), a speed handicap (for the London Flying Club Trophy), in two heats and a final heat, will be held during the afternoon.

The course is again around the aerodrome pylons, passing a turning point at Bittacy Hill on each circuit.

Passenger flights and special flying displays will be given during the week-end, and parachute descents on Bank Holiday.

After Bank Holiday, the regular weekly air races will be suspended until the Hendon-Brighton-Hendon Air Race, after which definite dates will be fixed for each meeting.

HOUNSLOW.—The following cross-country flights were made from Hounslow by Avropilots during the week ending July 26th:

Three to Brighton, two each to Weston-super-Mare and Swansea, and one each to Southampton and Liverpool.

Over 5,000 passengers have been taken up at Hounslow since May 3rd.

Lieut. Robertson, an Australian officer, under instruction at Hounslow, made a very successful first solo after 4½ hours' dual. On his second solo he looped, rolled, and did Immelman turns, and completed his Royal Aero Club test.

LIVERPOOL.

The Waterloo Aerodrome on the banks of the Mersey was opened last Saturday. As usual a huge crowd had collected, but with the aid of mounted police they were kept in hand. Picture, then, a gigantic yellow circle of sand with a radius of 200 yards, surrounded by a black band of humanity. In the centre of this place three Avros, and you have some idea of the inauguration of flying at Liverpool as seen from the air.

To the south-west New Brighton Tower, in course of demolition, stands gaunt and dark. One sees the wide sweep of the Mersey, choked with shipping unable to proceed owing to the dock strike, and on either bank the twin cities of Liverpool and Birkenhead basking in the sunlight.

Capt. E. Maitland Heriot, D.S.C., Lieut. Shanks, and Major McMinnies, A.F.C., were the pilots, whilst Lieut. Bambridge (who had the distinction of losing the tail of his machine at 15,000 feet in France and descending on the top plane more or less successfully) was in charge of the ground operations

For four hours the machines were in the air. The fair-haired flapper in multi-coloured jersey, the prosperous shopkeeper and his wife, public officials of the town, young men and girls, all essayed the air. Trips to Southport and Blackpool and acrobatic displays were in great demand.

One lady and her daughter after half an hour's argument at the booking-office, where Lieut. Bambridge at last persuaded her that she would not be killed, booked a flight. "Two minutes only, two minutes only, and quite straight and level!" she kept repeating to her pilot. He made a short climb, a gentle turn, and a landing. Afterwards both passengers were disappointed that the flight was so short, and promised to come another time for more.

And so it went on until the crowd melted away, and the pilots and mechanics, tired out, set out in the gathering mists for their homes at Southport.

MARGATE.

Twenty "Daily News" free flight passengers were taken up in Avro's at Margate during the week ending July 26th.

MIDDLESBOROUGH.

The Government have offered the Middlesbrough Corporation the first refusal of the Redcar Aerodrome. The Corporation has decided that they have no use for it.

MORECAMBE.

General flying in the North has been as successful as ever. Morecambe is in full swing with Lieut. Macr e, M.C., of A. V. Roe and Co., in charge.

SHEFFIELD.

A flying exhibition was held at Coal Aston aerodrome on the outskirts of Sheffield, from July 23rd-26th, under the auspices of the Sheffield Development Committee. The aviation department of Vickers Ltd. gave two-guinea flights in four two-seater Avros, and demonstrated the commercial utility of a Vickers-Vimy aeroplane with a saloon body to carry ten passengers.

On July 26th the first delivery of aerial mail took place between Sheffield and Doncaster. A Vickers Vimy aeroplane was used, and the machine covered the distance in 9½ minutes.

SOUTHPORT.

A flying party of cripples, who arrived on crutches and in bath chairs, was a feature of Wednesday's flying at Southport. It took five of the Avro's mechanics to lift one of the poor fellows into the machine.

A free flight was offered at Southport and Birkdale to the schoolboy who wrote the best essay on flying. It was won by William Stevenson, aged 10, of the Sefton Street Council School. His technical details were more or less correct, even if somewhat on the rosy side.

One woman passenger had 15 stunt flights during the week.

At Southport the Avro pilots received a visit from an inventor who apparently had a cure for every aeroplane ill at present known. His chief invention was a stabilising device for machines. It consisted of a series of balloons in the fuselage and a number of small propellers outside which could be driven either by wind or power.

When asked if he had an invention for preventing people from throwing themselves out of machines, he replied that he could provide for that, too. Having realised the advantage of his inventions, the pilot directed him to the proprietors of a rival aerodrome!

WINDERMERE.

A. V. Roe and Co., Ltd., are going to take over the aircraft shed at Cockshot Point as early as possible. At a meeting of the Windermere Urban District Council on July 18th the committee recommended the council to give the company every support.

CANADA.

The regulations controlling flying, being under the War Measures Act, lapsed with the declaration of peace.

An Air Board has been created in Canada under an Act passed during the present session. The Hon. A. L. Sifton is chairman, the members including representatives of the militia and naval service departments, the Deputy Postmaster-General and the chief inspector of the department of Customs and Inland Revenue.

Regulations forbidding trick exhibitions or low flying over town areas have been announced already, and a full code of flying regulations is under consideration.

THE ARGENTINE.

The first party of a French Aerial Mission to the Argentine has left France. The object of this Mission is to open up a French aeronautical industry in the Argentine by giving exhibitions with French machines in order to prove their possibilties

AUSTRIA.

The following is sent by the Scandinavian correspondent of THE AEROPLANE:—

Austrian information to be revealed at the end of the war includes a report of a helicopter, for which the Hungarian journal, "A Motor," claims success or almost complete succeeding.

Experiments were started by Lieut.-Col. (the Captain) Stefan Petróczys, as he found kite-balloons needing too much crew attendance, and being too easy prey of enemy aircraft. In his project from the first year of the war an electric motor was to be the power plant and the current to be supplied by cable from the ground.

The machine was built by the Austrian Aeroplane Works, Ltd. ("Oeffag"), in Vienna Newcity, the electric motor by the Austro-Daimler Company, the general director, Porsch, of which was responsible for a model of hitherto unattained lightness—in the words of the journal—300 b.h.p. being developed by a weight of 250 kilos. at 6,000 r.p.m., which number of revs. was reduced to 1,000 of the propeller shaft, yet had to be further diminished owing to shaft over-heating, the advantageous performance disappearing then again compared with the petrol engine.

As, further, the propeller results at the aircraft works were unexpectedly poor, prospects looked bad, when two Hungarians, the commander of the test department and the manager of the screw department of the flight arsenal, engineers Kármán and Asbóth, got charge of the experiments.

The Hungarian General Engine Works built a model that could stay in the air, powered by a compressed air motor, yet it did not come up to expectations.

Ae second test model of Professor Kármán was made by the Budapest firm, Liptág and Co., being provided with only two propellers against four of the first one, and rising with a petrol motor to an altitude of 50 metres. When the revs. of the motor once dropped the model side-slipped.

Asbóth, too, continued his experiments, having three more models built at the Hungarian Aircraft Works, yet fire broke out, and other conditions prevail now, the report concludes.

AMSTERDAM . . . *August* 1919.

We shall be represented at the
AMSTERDAM AIRCRAFT EXHIBITION
and visitors are invited to call at
STAND 307 and see our Mr. Haydn White.

Daily passenger flights in the famous Blackburn **"KANGAROO"** will be a feature of this Exhibition.

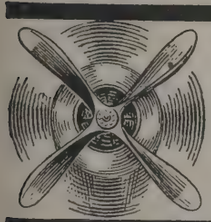
PLAIN IMPRESSIONS



By A. S. G. BUTLER.

With an Introduction by C. G. GREY, who says:

"The writer of this book is an architect by profession and was an artillery officer through the incidence of war. . . . Those who have had the privilege of serving the King in the field will recognise the deadly accuracy of the brief sketches which form this little book, and those who have not had that honour may gather from them an idea of active service somewhat different from that conveyed by the more highly coloured pictures of professional artists in words."

General Motor Repairs
:: and Overhauls ::

We have well-equipped Workshops and a good staff of trained mechanics.

TERMS MODERATE.

SATISFACTION GUARANTEED.

The line-of-battleship lieutenant, Baron von Banfield, the foremost pilot of the former Austrian-Hungarian Navy, in command of the naval air station at Trieste at the time of the breakdown of the Austrian forces, was arrested while his share in the bombardments of Venedig was gone into. After 36 days he was released and, at his request, allowed by the Italians to go to German Austria, where he is now learning bookkeeping. He has announced his future plans of going abroad for flying.

BELGIUM.

According to the "Nieuwe Rotterdamsche Courant" of July 17th, the Belgian Government has appointed a commission to study commercial aviation in the Congo. The first trial will consist of a regular service between Kinshasa and Stanleyville, on which the aeroplane will carry mail and passengers. The journey is expected to take two days. The service will start in January, 1920, with 12 hydroplanes, each fitted with a 300-h.p. engine having a speed of about 70 m.p.h., and a carrying capacity about 18 cwt.

The Commission is presided over by Colonel Baron de Crombrugge, who is the officer in command of the Belgian Air Force.

The following is from the Paris correspondent of THE AEROPLANE :—

H.M. the King of the Belgians opened the Aeronautical Exposition at Brussels on July 19th, and presented the colours to the Belgian Aviation Corps.

A Handley Page, several other British, and some French machines arrived, and performed evolutions for the benefit of the crowd. Many German aeroplanes were exhibited, as well as numbers of machines of all types used by the Belgian army.

FRANCE.

The following is from the Paris correspondent of THE AEROPLANE :—

The holiday season in France this year is starting on about August 1st, and on that date a good deal of flying is due to start, including the Toulouse-Casablanca aerial post—a service which has been planned by M. Latecoère during the last eighteen months. in view of the high insurance rates for aviation, M. Latecoère proposed sinking a fund with the leading French aviation firms for the purpose of insuring their own machines.

Farmans have sent a machine to Cabourg for the season to fulfil an old-standing engagement with the Town Council for passenger and exhibition flying. As there is no aerodrome in the vicinity, flights will be made from the golf course.

Flying should have commenced at Deauville, but there is some dispute over the land that had been chosen for the aerodrome.

The Société des Transports Aéronautiques du Sud-Ouest have obtained permission to fly at Biarritz. One Farman machine has been sent there, and three more, including a Goliath, are going next week.

The Compagnie Aérienne Française, who take photographs for the Press and for all sorts of commercial concerns, have executed some big orders satisfactorily. This work seems to have been neglected in England, but it has a great future in commercial survey work in the Colonies.

The Farman Flying School has turned out the first three pilots to obtain their brevets since the war. The Farman terms are £100, including everything.

Caudrons are reopening their school at Crotoy in the first fortnight of August. Instruction will be given on the Caudron G3.

The Paris newspaper "Excelsior" sent Mme. Favre Tavrier over to London in a Farman aeroplane to report on the Victory procession. £80 was paid for the return trip.

The Farman aerodrome at Toussus le Noble had a record week-end on July 19th giving passenger flights.

This enterprising firm make a regular weekly announcement in the Paris "Daily Mail." That of this week is given below :—

"TO THE BELGIAN VICTORY FETES BY AEROPLANE.

"This week the Goliath will leave for Brussels as usual on Tuesday morning, returning to Paris on Friday morning. Passengers will thus be enabled to witness the splendid fêtes that our Belgian allies are holding in celebration of victory.

"Messrs. Farman beg to announce that, besides the regular flights made by the Goliath, they can place at the disposal of business men or tourists a number of aero-taxis for one or two passengers and aero-limousines for parties of at least four passengers at the rate of 2 francs per kilometre and per person, as well as Goliath aerobuses for parties of at least ten passengers at the rate of 1 franc 25 centimes per kilometre and per person.

"It will be seen from the foregoing that the charge for an aeroplane flight is very nearly equal to and sometimes less than the charge for a journey by automobile."

A munitions store at Le Bourget aerodrome, near Paris, blew up one afternoon last week. Several pilots were killed and wounded, and several sheds with about twenty German machines were destroyed. The store contained Michelin bombs and a large quantity of rockets and cartridges.

So far no French aircraft firms have arranged to exhibit machines at the Amsterdam Exhibition.

The French Aeronautical Club, which was suspended during the war, is now reconstructed, and will promote aerial touring, and instruct and recruit men for military and civil aviation.

French pilots can join a trade union called La Ligue des Pilotes Aviateurs, which is doing good work.

Lieut. Roget, the French aviator, left Soesterberg, near Amsterdam, at 3 p.m. on July 28th, and landed at Evere, near Brussels, at 4 p.m., having covered the 112 miles in one hour.

GERMANY.

The following is sent by the Scandinavian correspondent of THE AEROPLANE :—

German war aviation stuck to few makes of almost one type—viz., the six-cylinder vertical fixed model, the Army favouring the Mercédès with top camshaft, made compulsory by other works, too, than the German Daimler Co., the Navy adopting chiefly the Benz push-rod model. The Loeb and Co. LUC Motor Works were known to manufacture the Austrian Hiero motor under licence, though it cannot be stated whether for German or Austrian needs.

When scouts required power plants beyond the Oberursel capacity along Gnome and le Rhone lines, the Siemens—camshaft and cylinders opposite rotating—and Goebel rotaries came to the fore, while of the new German fixed motors a British technical report was promised on a captured specimen of the Opel, the power plant of the early Hanoveraner aircraft, and another published on the Selve motor, chiefly employed on Rumpler biplanes and Sablating monoplanes of the long-distance patrol type, as well of giants, both being products of automobile works, having turned out experimental engines for the Emperor aero-motor competition.

The last German war-time favourite amongst motors for scout and altitude work was the Bavariaor B.M.W., as initials standing for Bavarian Motor Works, being successors to the Rapp Motor Co., in Munich. This motor was considered less durable in reliability than Mercédès and Benz, but was used for its good carburation qualities in high flying.

A syndicate was formed at Dusseldorf on July 3rd to establish an aerodrome there as a station for the future aerial post service.

Ten owners of contiguous gardens and estates in Gothenburg have sold their properties, on which an aerodrome is to be constructed.

The Zeppelin Company have stated that regular airship services between Germany and the United States will not begin until next spring.

HOLLAND.

On July 24th a Handley Page aeroplane, which was on a voyage from England *via* Brussels for Amsterdam, arrived at Soesterberg Aerodrome.

A. V. Roe and Co., Ltd., are exhibiting a model of the 504K type at the Amsterdam Exhibition.

Five Avro machines will fly from Manchester to Amsterdam, *via* London, Lympne, Dunkirk, and Belgium, to take up passengers during the Exhibition. Some passengers can be carried en route.

ITALY.

The 700 h.p.-engined Fiat aeroplane which arrived at Kenley from Rome on July 16th, having flown at a speed of over 160 m.p.h., is reported to have crashed at Marquise between Boulogne and Calais. It left Kenley on Saturday, July 26th, for Amsterdam. Lieut. Brack-Papa, the pilot, and Lieut. Bonaccini were uninjured.

SCANDINAVIA.

Major Galpin, R.A.F., of N4044, the British naval flying boat, which has just arrived in Norway reports that negotiations are opened between the Norsk Luftfartrederi and a British company for a future service between Norway and Scotland, and it will probably begin this year or early next spring.

* * *

The following is sent by the Scandinavian correspondent of THE AEROPLANE, and has been entered under Scandinavia, as it refers generally to Norway, Sweden and Denmark :—

The Norwegian Parliament has placed £3,300 at the disposal of the Trade Department as a first contribution towards air traffic developments and aeroplane mail service preparations, though there was some opposition on the ground that the money was required for no definite proposition.

* * *

Having last year organised the first Scandinavian aero exhibition at Christiania, the "Northern Aircraft, Ltd.," will inaugurate the first Norwegian flying school, buying Allied equipment —viz., British Avros and French Caudron biplanes.

* * *

The first step towards fostering and regulating air traffic taken by the Swedish Aero Club was a prize offer, open to Scandinavian competitors, for the most suitable type of air-traffic shed, the prize going to a Swedish winner, while, too, the drawings of a Norwegian engineer were bought.

* * *

Availing themselves of the low mark value prevailing owing to Germany's bad export situation compared with the import

amounts, the Swedes bought first three Friedrichshafen seaplanes and four Benz spare engines for them for the Navy. When the twin-engined A.E.G. biplane made its non-stop demonstration flight to Eksjö and on to Malmslätt, the aviation centre of Sweden, five A.E.Gs. were ordered, three of which were one Sunday to be delivered by air from the Berlin works.

The aeroplanes encountered bad weather. One dived into the Baltic Sea off Warnemünde, its crew of three men, including an army officer pilot, being killed. The two other aircraft were forced to land, one owing to engine trouble, the other from lack of petrol.

As later a fatal accident with one A.E.G. biplane was only avoided at Malmslätt by the skill of the pilot, Lieut. Segebaden, and as Lieut. Eckerström, of the Naval air service, with his engineer passenger, was killed on a Friedrichshafen seaplane, good luck cannot be said to have followed German aircraft.

The Swedish Lieut. Herrström has returned from England with aircraft bought there, some Avros going to be demonstrated by British pilots at Stockholm.

* * *

The end of hostilities has almost affected neutral aircraft activities more hard than doings in the belligerent countries. The Swedish Thulin works in Landskrona were undoubtedly the largest aero enterprise in any of the neutral countries left, not excepting the Hispano-Suiza company in Barcelona, business having been mainly built up upon deliveries of chiefly rotary motors (mainly of le Rhone type) and a number of scout monoplanes to Holland, some motors and aeroplanes of Morane monoplane and Thulin tractor biplane types having further been supplied to Sweden, Norway, Denmark, and Finland, permit having just been obtained for exporting the first motors to Japan, when the war stopped at a most inconvenient time for the Thulin concern, as the capital was going to be increased and the Dutch contracts for rotaries had been completed, while the first series of 160 h.p. water-cooled motors (Maybach fashion) and German type tractor biplanes had only just been supplied to the Swedish Flying Corp. The shares dropped from 250 to 60, the manufacture was stopped, only 100 workmen out of 2,000 being kept, and Dr. Thulin was dismissed as managing director on complaint of not having prepared after-war trade.

The Thulin Aeroplane Works run their own aerodynamical laboratory and the largest Scandinavian flying school.

Being himself a skilful pilot—his last notable flight being from Christiania to Landskrona on his own monoplane after the first aero show in the Norwegian capital last year—Dr. Thulin was appointed to the committee sent by the Swedish Government to England, France, and Italy to study war aviation developments and the stand of air traffic preparations, that were for the latter part found less than expected, and on his return practised fancy flying, when he was slung out of his aeroplane and got beheaded by falling on a ship.

The Thulin works have now turned their attention to the manufacture of motor-cycles and agriculture tools.

* * *

Major C. H. R. Johnstone, late R.A.F., and Capt. K Saunders, late R.N.A.S., are now in Sweden working for the P.O. Flygkompain. They have two Avro biplanes and a D.H.6 machine, and are at present employed in passenger flying, but will at a future date start a school. Their only competitors were two Germans on Phœnix machines (240 h.p. Mercédès engines), who did practically no stunting at all. Major Johnstone and Capt. Saunders says that the Swedish Air Force consists of a few Blériot, Morane Parasol, and Albatros machines, all of pre-war types.

SPAIN.

According to a "Daily Express" report, regular air services will be started shortly between Malaga and Melilla (Morocco), and between Barcelona, Alicante, Rabat (Morocco), and Toulouse.

A representative of a French aviation firm arrived at Seville on July 21st, to organise a Paris-Bordeaux-Madrid-Seville-Algiers flight.

SWITZERLAND.

The Swiss Federal Council has approved a Bill for the temporary regulation of aerial traffic. It is provided in this Bill that foreign aeroplane owners and pilots will only be admitted in special circumstances by a permit from the Military Department.

Insurances covering third-party risks up to 15,000 francs (£600) must be taken out for each aeroplane. Pilots will not be allowed to fly over large towns at a height under 1,000 metres and over other towns at less than 500 metres. No stunting will be allowed.

SYRIA.

A number of British Officers with a Handley Page aeroplane have left Cairo for the Damascus-Bagdad aerial route. The distance is approximately 500 miles, and is partly over the Syrian Desert.

U.S.A.

Mr. F. G. Dillon, the president of the United Aircraft Engineering Corporation of New York, is at present in London in connection with the development of commercial aviation.

Mr. Dillon has said that the Americans are most optimistic over the future of commercial aviation, and are now in the position where they expected to be in 1920. Plans have been laid and are maturing for a commercial air service between Chicago and New York (900 miles), which will save a whole day's journey on the railway. A New York to San Francisco service is also being considered.

At present in the United States there is rather a lack of control, as a Government board issues licences for pilots and machines with very little formality, but laws are being drafted to cover these questions.

The Treasury gives no support to the aircraft firms, but this is not necessary, as there is no lack of financial backing.

The Government will be asked, and doubtless consent, to establish meteorological stations at intervals over the country.

On July 21st an airship, with which it was intended to start a passenger service, was engaged in test flights from its hangar at the White City Amusement Park at Chicago.

The airship was on its third trip over the city in the late afternoon at a height of 500 ft. when it burst into flames and broke in two.

Three men out of the five who were in it left the gondola with parachutes, and two of them landed safely in the crowded streets. The third was caught by the flaming wreckage and with it crashed through the glass roof of the Illinois Trust and Savings Bank, where 200 employees, mostly girl clerks, were at work. The building caught fire. The petrol tanks exploded inside. Eight clerks were burned to death and 27 severely injured

The airship was 162 ft. in length, had two 80 h.p. engines, and a gas capacity of 100,000 cubic feet, and was sister to the A.4, which is in service with the American Army.

On July 25th, 20 pilots employed for the transportation of mails by air notified the Postmaster-General that they would cease work unless two of their number recently discharged were reinstated.

The two pilots were discharged because they demanded improved machines in place of the older types. The strikers declare that the present aeroplanes are unsafe, and that they are not allowed safety appliances. In one week there were 15 accidents and two deaths in the service.

The pilots protest against the rate of pay, which is the same for them as for the groundmen, both receiving £400-£700 a year, according to length of service.

All the Government aeroplanes carrying mail flew on July 25th as usual, the Government saying that reserve pilots were used. The strikers claim that they were hired strike-breakers.

AIRCRAFT FINANCE

THE DEVELOPMENT OF PLEASURE TRIPS.

The idea of popularising flips by providing advance booking facilities "through the usual agents" is sound. Such a method seems to carry conviction that flying is a serious commercial proposition, and should do a lot to dissipate the notion that it is a hobby intended especially for those who like to take a plenitude of risk, and, in the language of a living statesman, to "damn the consequences."

Insurance Facilities.

Conceivably the popularisation might be expedited if the insurance facilities were prominently explained. These facilities are adequate, and after glancing at the schedule one is convinced of the simplicity of the procedure. It is a matter that should be taken up seriously by those who are developing pleasure trips and passenger business generally.

Simplified Methods.

The scheme of the Aviation Insurance Association may be quoted as an example. The risks covered are:—

Aerodrome pleasure flights as specified in the policy per half-hour or part of half-hour.

Seaplane coastal flights as specified in the policy per 50 miles or part of 50 miles.

Cross-country flights as specified in the policy per 50 miles or part of 50 miles from the starting-place.

Cross-country flights as specified in the policy per 100 miles or part of 100 miles from the starting-place.

Cross-country flights as specified in the policy per 200 miles or part of 200 miles from the starting-place.

Special flights X to X as specified in the policy.

Premiums Quoted.

There will be quoted premiums for each of the above risks under, say, two different schedules of benefits. Each risk being defined per a separate proposal form, a rate will be made for each risk, and the scale of rates so arrived at will be incorporated in a covering policy.

The Combination of Policy and Ticket.

When booking his or her ticket, the passenger will be asked if he desires to effect insurance for death only, or benefits, or death and benefits, and under which scheme. The requirements being defined, and the tariff of rates supplied being consulted, it should not take the average clerk more than a second or two to ascertain the rate.

Procedure.

The terms being accepted, a form will be filled up and completed by the passenger signing his name and at the foot of the facsimile impression thereof. The passenger secures his copy. The form could be used as part of the ticket, even if insurance were not effected.

Three records of the transaction being made by the use of carbon sheets, one copy might be posted the same day to the insurance office concerned, and the premium stated thereon would be debited to the holder of the policy and collected in due course.

Benefits That Should Accrue.

The simplicity of such a scheme should commend itself to everyone. The settlement of the preliminaries between the transport company and the underwriters would be easy and quick. The type of risk being clearly defined, and, of course, an understanding being arrived at prohibiting any deviation from the ordinary business to be done, the underwriter would soon calculate a minimum rate.

It would be impossible to quote a flat rate covering all risks embraced under such a scheme. At least it would be unreasonable to expect such a low premium, because the underwriter would have to assume it would be an even chance that the most dangerous risks would be more or less paramount and raise the rate accordingly.

Without a doubt the proposal seems attractive, and should be beneficial to the growth of the pleasure business. Insurance gives a sense of security.

CURRENT TOPICS.

Unsettled Conditions.

Little consolation is afforded by reflecting that the labour troubles were inevitable soon after Peace was fixed up. They unsettle everything, and unsettlement is the worst possible thing for business, whether it is financial business or industrial. Hence, the Financial World is not in a happy state with transactions cautiously entered into and restricted wherever possible.

The Floating Debt.

Already a considerable quantity of floating debt has been eliminated as a result of the big loan operation. The amount approximates £206,350,000. But £724,117,000 is still outstanding in the form of Ways and Means advances granted to the Treasury, and, in addition, £670,000,000 in the form of Treasury Bills. There will be a further reduction, but a hefty lump will remain, and one would hope that some inspired financial genius would come along and wipe out the whole of it. The Nation would be healthier. But it is hopeless to expect anything of the sort.

The Whitehead Prospective Purchaser.

There is no business in Whitehead Aircraft descriptions, but there are would-be buyers quite prepared to take considerable quantities of the ordinary shares at about 4s. Possibly this may not be unconnected with those interests which are to make an offer to acquire the undertaking on terms to be decided after the examination of the position. Rumour says that certain people originally associated with a popular Store business are the prospective purchasers.

By the bye, a meeting of unsecured creditors, whose claims aggregated £30,000, passed a resolution to the effect that their best interests would be served by voluntary instead of compulsory liquidation of the company.

Motor and Aircraft Supplies Company Liquidation.

At a meeting of the creditors, presided over by Mr. O. Sunderland, a statement of affairs showed liabilities £61,404, while the assets were estimated to realise £34,072. From the latter had to be deducted £931 13s. 6d. for preference claims, leaving net assets of £33,140. The company was registered in 1916, as the Aircraft Supplies Co., Ltd., but the name was changed to the present one in March of the present year. The capital of the company was not sufficient to carry on the undertaking, and it was financed by the Beecham Trust, Ltd., and the Bank. The former had advanced £16,266 19s. 2d., for which they were creditors, and there was an overdraft at the London, Westminster and Parrs Bank, of £27,380. So far as the company was concerned those were unsecured claims. The Beecham Trust held no security, but the overdraft at the bank had been guaranteed by Mr. James White. Following the Armistice there was a great slump in the Aircraft business, and a corresponding falling off in the value of the large stock held by the company.

The Chairman said he understood that there were some very heavy contingent liabilities in connection with broken contracts. He understood that the claims in that direction might result in the liabilities being doubled.

MORTGAGES, CHARGES AND SATISFACTIONS.

Aero Stations, Ltd.—Mortgage on New Salts Farm, Lancing, to secure £4,268. Registered June 10th, 1919. Holder, Mrs. A. C. J. Easter, Old Salts Farm, Lancing.

AIRCRAFT IN PARLIAMENT

The following oral answer was given on July 21st:—

AIR CONVENTION.

Major-Gen. SEELY, the Under Secretary of State for Air, replying to Capt. WEDGWOOD BENN, said: The Supreme Council of the Peace Conference have agreed to the immediate publication of the Air Convention.

* * *

The following written answers were given on July 21st:—

ROYAL AIR FORCE—TECHNICAL PAY.

Major-Gen. SEELY, replying to Lieut.-Col Sir F. HALL, said: The Technical pay which has been awarded in the past to officers graded Category "A" Technical, has been according to rank, viz.: 2nd Lieut. 2s., Lieut. 3s., Capt. 4s., Major 6s. 6d. per day

This pay dates back to April 1st, 1918, or to the later date on which the officer was so graded, and is also given to officers demobilised before the decision was arrived at. The technical pay does not affect the gratuity.

AIR MINISTRY (CORRESPONDENCE).

Major-Gen. SEELY, replying to Mr. MACQUISTEN, said: Mr. Norman Thompson's urgent letter, addressed to the Air Ministry, of July 20th, 1918, was acknowledged two days later on behalf of Lord Weir, and Mr. Thompson was informed that it had been forwarded to the Director-General of Aircraft Production, Ministry of Munitions, whom it concerned.

NORMAN THOMPSON FLIGHT COMPANY.

Mr. MACQUISTEN asked the Parliamentary Secretary to the Ministry of Munitions whether a member of the Contract Claims Department of the Ministry of Munitions, acting for the Lubbock Committee of the Treasury, made a recommendation to the Aircraft Finance Department of the Ministry of Munitions to purchase Messrs. Cox and Company's debenture in the Norman Thompson Flight Company and re-vest the control of the company in Mr. Norman Thompson and his co-directors; why the Government gave orders to the receiver after neglecting to do so to the Norman Thompson Company; and whether it is an established custom or rule of the Treasury not to give orders to a receiver.

Mr. JAMES HOPE: The answer to the first part of the question is in the negative. As to the second part, it was only after the appointment of a receiver that a decision was reached as to the design of the flying boat in question. The Treasury do not issue any orders in a case of this sort. During the War, however, the Ministry of Munitions sometimes gave orders to a receiver in cases where there was a reasonable prospect of obtaining supplies which were urgently needed.

* * *

The following oral answers were given on July 22nd:—

FLYING-BOAT SERVICE.

Lieut.-Comdr. KENWORTHY asked the Under Secretary of State to the Air Ministry whether it is intended to establish a regular service by flying-boat between the North-East Coast of England and Northern Europe; and, if so, under what conditions?

The UNDER SECRETARY of STATE for AIR (Major-Gen. Seely): It is not intended to run a Government service between the East Coast of England and Northern Europe. Those flights which have been and are being undertaken are to demonstrate the possibility of such flights and to gain experience.

Lieut.-Comdr. KENWORTHY: Will encouragement be given to private enterprise to establish some such service?

Major-Gen. SEELY: Oh, yes, Sir. Every encouragement that can properly be given will be given. There is no doubt a great future for flying boats, especially to these countries.

Capt. BENN: Are any negotiations going on with the Post Office towards setting up an aerial mail?

Major-Gen. SEELY: Perhaps it would be better to put a question to the Postmaster-General on that point. In regard to flying-boats no actual proposals are now before me, but any such proposals will receive careful consideration.

Lieut.-Comdr. KENWORTHY: Have any negotiations taken place with Northern neutral countries, with a view to joint action in establishing such services or assisting them by private enterprise in the matter?

Major-Gen. SEELY: That is rather a large question. Perhaps the hon. and gallant gentleman would put down a question on that specific point.

* * *

The following written answers were given on July 22nd:—

WINCHESTER REPATRIATION CAMP (LEAVE).

Major-General SEELY, replying to Mr. Lunn, said: The Royal Air Force Repatriation Camp at Flowerdown, Winchester, was formed in May last. Leave is given at frequent intervals.

AERODROME, FLOOKBOROUGH.

Mr. TYSON WILSON asked the Secretary of State for War whether he is aware that the construction of a large aerodrome was commenced at Flookborough during the War; that railway sidings were laid down and workmen's huts built, but that the same was discontinued owing to the then shortage of steel for constructional purposes; and whether he will consider the advisability of reconsidering this matter with a view to affording Messrs. Vickers, of Barrow, an opportunity of continuing to cater for this trade?

Major-Gen. SEELY: The question is for the Admiralty, and perhaps the hon. Member will address that Department accordingly

* * *

The following written answers were given on July 23rd:—

AEROPLANES CONSTRUCTION (CYPRESS).

Mr. REMER asked the Under Secretary of State to the Air Ministry whether he can now make any further statement as to the serious losses caused in his Department by the sanction of the use of cypress on aeroplanes; whether he has been able to establish the blame for this loss, and whether he is now in a position to make a statement as to his decision to strengthen his advisory committee with practical expert opinion in order to avoid such blunders in future.

Major-Gen. SEELY: With regard to the first two parts of the question, I would refer my hon. friend to the answers given to him on May 1st, 21st and 26th, and June 26th. In accordance with a suggestion made by my hon. friend the Conjoint Board of Scientific Societies were invited to consider the co-option of representatives of the National Federation of Sawmill Proprietors. The absence of the chairman of that body in America has involved delay, but he has now returned, and I will inform my hon. friend shortly what decision has been come to

AMSTERDAM EXHIBITION.

Capt. W. BENN asked the Under Secretary of State to the Air Ministry what firms have received from the Air Ministry permission to exhibit machines and engines made under Government contract at the Amsterdam Exhibition.

Major-Gen. SEELY: The following firms have received Air Ministry permission to exhibit machines at the Amsterdam Exhibition:

Gosport Aircraft Company, F.5 Flying-boat.

Messrs. Handley Page, V.1500.

The Aircraft Manufacturing Company, D.H.10a

DISABLED OFFICERS (PENSIONS).

Major-Gen. SEELY, replying to Mr. W. NICHOLSON, said that Lieut. P. A. Baker, R.A.F., who is in hospital as a result of a crash in France in Sept., 1917, and who has been marked for a further six months' treatment, has been informed that he is to be gazetted out of the Air Force. His pay as a Lieut. in the R.A.F. is 14s. per day with free maintenance, but his disability pension cannot be stated until the Ministry of Pensions have examined the case. The normal rate of pension in such a case, if the officer is fully disabled is £175 a year, plus a bonus of 20 per cent., from which a deduction of 4s. 6d. per day is made if the officer is maintained in hospital. This officer has received the utmost advantage and consideration that the Regulations allow. Eighteen months is the fixed period for an officer to receive full pay before his case is taken over by Pensions Board. In this case the period has been exceeded by six months.

* * *

In the course of the debates on the Naval Estimates on July 24th, the following allusions to aircraft were made:—

Mr. LONG, replying to Capt. Wedgwood Benn, said the final arrangements between the Admiralty and the Air Ministry about the construction of airships and the transfer of that department to the Air Ministry had not been completed.

Mr. LAMBERT: Is the Navy to have its own air service, or is it to be placed under the Air Ministry? I think the Air Ministry, if it is under the War Office, will have considerable difficulty in persuading the Admiralty that the air service of the Navy should be under the War Office.

Mr. LONG: It is not settled yet.

Rear-Admiral ADAIR: I observe on the Paper to-day a Motion to the effect that in the opinion of this House the Army, Navy, and Air Force should be brought under the supreme direction of one Cabinet Minister, and that there should be one war staff college.

Lt.-Comdr. KENWORTHY: The question of airships concerns the Admiralty, and I should like to ask the First Lord to give pause before he proceeds to relate the programme of airship building. These airships cost £350,000 each, and there are great sheds which will be of doubtful value in the future. The reason is that aeroplanes and seaplanes are advancing in efficiency so rapidly that an airship will have about as much chance with the aeroplane as a sailing ship has to-day with a cruiser.

The analogy is this—that the sailing ship was useful for a certain time, and then it became obsolete, and this is the same as the airship, which, I believe, will be dead in spite of a non-inflammable gas or any other improvements. Therefore I do beg the right hon. gentleman not to spend too much money on airship building programmes. The money should be spent rather on aeroplanes. There is little enough money, and it should be laid out to the best advantage.

I do not think of the airships from the military point of view. People keen on airships are naturally keen on their weapons, but unfortunately the Admiralty is responsible for airships, and the Air Minister for aeroplanes, and therefore the airship schools have an unfair pull in the councils of the war.

Captain BENN: At the present time there is a programme of airships. There are six big airships being built at a total cost of over £2,000,000. These are being built by the Admiralty, and under the control of the Board of Admiralty. Are they being manned by the Air Force personnel, or by the Admiralty personnel? Perhaps the right hon. gentleman will tell me?

Dr. MACNAMARA: I should say off-hand by the Admiralty personnel; but I speak subject to correction.

Captain BENN: When I ventured to ask the First Lord of the Admiralty to make a statement on the subject he brushed the whole matter aside and refused to deal with it; so that the Committee will not lay it to my charge if I had not got all the information that I ought to have for this purpose.

Everyone with experience in air matters is unanimous that everything that goes in the air should be under one control.

One of the great mistakes made by the first Coalition Government was that they did not unify the Air Service in 1915, or we should have had the Germans beaten in the air much sooner than we did. Why is it absolutely essential that you should not have two Departments of the Government both constructing air parts? The reason is perfectly obvious. The Department over which the right hon. gentleman presides, in the olden days, used to go into the market and compete for the same engine with the Department presided over by the Secretary of State for War. I know cases—everybody knows them—where the manufacturer had bids from the War Office and the Admiralty for the same machine. Very wisely he made the best bargain he could. But is it not ridiculous that you should have two Departments of the same customer competing for one article? Yet the right hon. gentleman opposite says that everybody is not agreed that they ought not to exist.

Mr. LONG: The hon. and gallant gentleman said everybody was agreed that there should be one control of the Air Service. All I suggested was that everybody was not agreed.

Captain Benn: It is a most extraordinary thing that the Secretary of State for War of this House should assert the principle of an undivided control of air matters, while the right hon. gentleman opposite tells us that it is a highly debateable point.

Mr. LONG: I said nothing of the kind.

Captain BENN: Then what does the right hon. gentleman say? I do not know. The Committee must judge.

Mr. LONG: Hear, hear.

Captain BENN: I lay it down that the unanimous opinion of all those competent to form an opinion is that everything that flies in the air should be under one control. I understood that that was the policy of the Government. If it is not the policy of the Government perhaps the right hon. gentleman will say so; then we shall have a Debate to see what the opinion of the House of Commons is on the matter. As to material, take an airship and an aeroplane. Is it not absurd that you should have two Departments constructing the same thing. The R34 had the same make of engine as is used in an aeroplane, except, of course, the gasbag, which is of a totally different

material, and there is not much in that point. As regards the war equipment of an airship, it is very similar to the equipment of an aeroplane. You have the machine-guns, the bombs, and the releases, a set of photographic apparatus, and the like, and I think it is an uneconomical and thoroughly bad system under which you have the Admiralty and the Air Ministry both constructing the same thing. I understand that that had been abandoned, and that it was one of the four points upon which the second Coalition Government was formed.

There is no difference in many respects between the work done by an airship and an aeroplane. Take some of the things we are most backward in, such as correct bombing and aerial gunnery. Aerial gunnery is in its infancy, and two persons go and fire point-blank at one, and that is the state into which we have got. The airship affords the most direct means of making experiments and progress in aerial gunnery, and yet the airship is under one control and the aeroplane is under another Department.

Take the question of the Davies gun. That has been experimented with in aeroplanes, but the airship is a better platform for it. Now the right hon. gentleman is going to make those experiments, and the thing is absurd, and this is a very highly reactionary step in the policy of the Government.

Take photography. The difficulty of working photography in an aeroplane is very great because of the speed, the rush of air, and the quick movement of the machine, and the constrained state in which you work. If it does not work it is very difficult to put right, whilst in an airship you have much more room, and you can walk about, and therefore you can make experiments in photography in an airship which you cannot make in an aeroplane. We get one right. hon. gentleman controlling the aeroplane, and another the airship, and consequently the benefit of united experience is wasted.

With regard to the manufacture and use of airships it is absurd that there should be division of control. I have been speaking of these machines as war weapons. I understand that this kind of aircraft is being arranged entirely to carry as their load war munitions, and they are not being fitted to carry commercial loads. If you are spending £2,000,000 upon airships of this kind for war purposes, I think that is a policy which this Committee should never sanction.

Now I turn to a really much more important side of the question, which is the civilian use of this craft. Everybody knows that the airship possesses certain great advantages over the aeroplane.

I hope the right hon. gentlemen opposite (Mr. Long and Dr. Macnamara) will give me their attention, as it is not much to ask. It is only the courtesy of debate in this House to do so, and this is just as urgent as any of the grievances which have been raised in debate to-day.

There is no doubt that there is a big commercial future for the airships. Nevertheless, as a means of testing the atmosphere and making experiments in the way of aerial navigation, there is no doubt that the airship has got a very great future before it. But the airship is under the control of the right hon. gentleman and has nothing to do with the Ministry. The right hon. gentleman would be the first to resent the idea that any part of his Department is under the control of the Air Ministry. We thus see a tendency to divide once again the Air Service, and all the experience which the right hon. gentleman's Department has collected under the guidance of sailors, who are the very people who can contribute most at this time to aerial advancement, is not in any way correlated to the work of the Air Ministry.

Supposing you are making experimental flights for the Egyptian mail, and you have an airship which is going to Taranto and Port Said. If the Air Ministry are testing a big machine with multiple engines over the some route, are they to have separate crews doing the same thing? It is absurd. It is perfectly obvious that to secure the necessary experience and the necessary certainty for these aerial routes you must have everything that flies under one control. I recognise the very great service that the Admiralty have rendered to the cause of aviation. At the beginning of the War, when the present Secretary of State for War (Mr. Churchill) was at the Admiralty, great advances were made in the way of aviation in the Royal Naval Air Service, but that was succeeded by a period of blight, when, instead of encouraging aviation, the Admiralty did the very reverse. I know what I am speaking of, because I served in the Royal Naval Air Service for some part of the War, and I know that the thing was controlled in some cases by people who had no sympathy and no knowledge.

Lieut.-Col. MOORE-BRABAZON: It is not very often that I agree with my hon. and gallant friend (Capt. W. Benn)—we differed the other day on the question of the protection of such things as chicory and saccharine—but we do agree to-night on the protection of the dear old gas-bag. As the Member for Chatham, I am a believer in the Blue Water School, but I am also a believer in the Blue Sky School, if one may pay such a delicate compliment. To-night I want, not to attack the Admiralty, but, I suppose, the Navy. The Admiralty in the matter of aviation appear to me to have done very well, but the whole tradition of the Regular Services has been always to be behind the spirit of advancement and always to have it forced upon them. It was upon the initiative of the Aero Club that the pilots in the Navy were taught to fly. There is no doubt, however, that aviation relatively to naval matters did come into its own towards the end of the War, but that was forced upon the Navy by the civilian element in this country.

I want to say a word with regard to airships in general. The only possibility of any future for the airship from the military point of view is the substitution of one of the inert gases for the present highly inflammable gas, but that is a very difficult and expensive matter, and it will be long before we shall see one of those invulnerable airships flying in the air. It is a very curious thing that the Admiralty, through the most amazing obstinacy, has gone on, right through this War, building an airship which clearly was of no use during the War, but now turns out to have a certain use from the commercial point of view. We must remember now that aviation is to be found to be of use to this Empire, and I am serving on a Committee which is to see in what way we can help to link up our various Dominions by air service.

I wish to ask the right hon. gentleman two questions. The first is, whether he has any news as to the allocation to Great Britain of the big Zeppelins made in Germany that have been surrendered to the Allies. Some of these are as good as the latest big airships, and we ought to know as soon as possible what share of them will come to this country. My second question is as to the policy to be taken by the Government with regard to airships in future.

Dr. MACNAMARA, replying on the Debate, said (among other things):—

The responsibility of the Admiralty for aviation is confined to the construction and maintenance, including repairs, of such rigid and non-rigid airships and airship stations as the Naval Staff desire for war services. The Director of Air Division looks after the requirements of the Navy, and maintains the necessary relations with the Grand Fleet, the Senior Naval Officers of Bases, the Air Council, and the Admiralty Departments concerned.

We are going on with the construction of six rigid airships, at a total estimated cost of about £2,200,000, and further with the shed for the R34, which cost approximately herself £350,000, the cost of the housing shed, together with extensions and wind screens, being about £166,000. The R34, I should say, goes on R rates.

WEATHER FORECASTING.

The following article by the "Times" meteorological correspondent appeared in that paper on July 28th:—

The necessity for a co-ordination of the various official and Service organisations engaged on weather problems, in relation to flying, makes it opportune to recapitulate the conditions which have led to the present anomalous conditions under which weather information is collected and disseminated.

At the outbreak of war, the Meteorological Office of Great Britain was the only governmental organisation devoted to meeting civil and service requirements in matters and problems connected with the weather.

This establishment, under the directorate of Sir Napier (then Dr.) Shaw, F.R.S., one of the ablest meteorologists of our times, was, and still is, openly admitted, even by Continental departments, that have every reason for rivalry, to be among the best organisations of its kind in the world. With the dispatch of an expeditionary force to France and Belgium in 1914, however, the inauguration of a subsidiary military service became essential, and this was formed and proceeded overseas early in 1915.

Later in the same year it became a section of the Royal Engineers under the command of Captain (now Colonel) Gold, D.S.O., F.R.S.—until then Superintendent of the Statistical Division of the Meteorological Office, and previously Schuster Reader in Meteorology at Cambridge. The commissioned ranks of the unit were drawn almost entirely from the professional staff of the Meteorological Office.

Throughout the war this offshoot of the central department proved itself of great value to the Expeditionary Forces in France, Salonika, and Italy. In 1915 also certain junior members of the Meteorological Office staff obtained commissions for work in connection with the airship section of the R.N.A.S., and used their opportunities to such good purpose that they formed in course of time the nucleus of the extensive organisation which, after the fusion of the R.F.C. and the R.N.A.S., became known as the Royal Air Force Meteorological Service.

At this juncture a few officers continued with the Admiralty, and constitute to this day a small Naval Meteorological Service. A large majority, however, in common with other R.N.A.S. officers, were transferred to the R.A.F. Much valuable work has been accomplished by each of these several organisations, but it is not quite accurate to state that an absolutely vital branch of modern meteorology—the exploration of the upper air—was "more or less neglected" before the formation of the R.A.F. Meteorological Service.

For many years before the outbreak of war this branch of meteorological study had received the undivided attention of Mr. W. H. Dines, F.R.S., Director of Experiments on the upper air for the Meteorological Office, formerly at Pyrton Hill, latterly at Benson (Oxon). He is responsible for many of the methods and instruments through which upper air data are rendered available. The results obtained by the establishments at South Farnborough and Upavon and by Capt. C. J. P. Cave's co-operation with the Meteorological Office at Ditcham Park, Petersfield, are still the classical studies of the upper air in this country.

The procedure employed by the Air Ministry Service was devised and the instruments used were supplied by the Meteorological Office, and it is only fair that the pioneers in this matter should not be deprived of the credit which is their due. The rapid increase of aviation and of high-angle gunnery associated with the early stages of the war found a sudden and unexpected practical use for the large accumulation of upper-air data already in the possession of the Meteorological Office. New methods were also devised and perfected during the war by the scientific staff attached to Naval Ordnance.

Forecasting for different parts of the world has to deal with a great variety of aspects of meteorology, but for the British Isles and the middle latitudes of the Atlantic forecasting on the lines laid down by the Meteorological Council in 1871 is not a difficult matter, and there are instances in which juniors of the Meteorological Office staff have undertaken the duty in other establishments.

Forecasting is not yet by any means infallible, even for those who have long years of experience, and its improvement on scientific lines requires the most advanced meteorological training.

THE EAST LONDON COLLEGE COURSE.

The East London College (University of London), at which important aeronautical work has been conducted during the war, is arranging for two courses of instruction in aeronautics beginning in September next.

The first course is of one year's duration, and is suitable for those who have some knowledge of engineering and science subjects. The second is a three years' course in engineering and aeronautics for the B.Sc. (Engineering Degree of the University of London), and will be conducted by Mr. N. A. V. Piercy, B.Sc., a recognised teacher of aeronautics of the University.

Experimental wind tunnel work will form an important part of the course. Particulars of these courses may be had on application to Mr. E. J. Wignall, registrar of the college.

AERONAUTICS and The LAW

THE SOVEREIGNTY OF THE AIR.

By THE LINCOLN IMP.

"The contracting States recognise that every State has complete and exclusive sovereignty in the air space above its territory." This tolerably momentous declaration forms Article I of the new Convention relating to International Air Navigation—to give the treaty its full and tedious title.

When any new and large domain comes for the first time under the control of man he casts about him for some suitable analogy to follow, and great importance may attach to the analogy which he selects.

Thus motoring was hampered in its infancy by the analogy of the steam-roller, while the study of electricity was helped by the analogy of water. Ways on rails have been both helped and hindered in their development by coach and road analogies.

As with physical domains so with intellectual. As new worlds were discovered in the past the practical question soon arose, under whose control were they to be put? To this problem the analogy of the old world gave no answer. In the old world title to territory was traced through history, and in theory title was never new. The new worlds at first were distributed by Papal Bull—west of such and such a line to Ferdinand and Isabella, east of it to Portugal—on the analogy of sovereign grants of land to subjects. Later the Roman Law of *occupatio* was called in aid to give the new-found worlds to their discoverers and to the settlers in them; *quod nullius est id ratione naturali occupanti conceditur*—"land that is no man's naturally is given to whoever comes and occupies it."

To Whom Shall It Belong?

The untamed air is now made subject to man's domination. Whose shall it be? What is the analogy which we should follow?

If we turn again to Roman Law we get an answer. The Emperor Justinian in his 'Institutes (published A.D. 533) wrote: "Some things are the common property of everybody, some are public property, some belong to municipalities, some belong to nobody, but most belong to individuals. The following are the common property of all:—The air, running water, and the sea, and (because of the sea) the seashore." Here we have a physical analogy—the sea—and an intellectual one—the common property of all. The high seas are not the subject of sovereignty or property. They are public highways open without distinction to the craft of all nations. In the Roman Empire this was so, and it is still so now, but it has not always been the accepted rule. "History is full of claims to sovereignty or dominion over the open sea, . . . the claims of Spain . . . and of Portugal . . . were the most outrageous of any in respect both of their geographical extent and of their refusal even of innocent passage. They were repudiated and practically set at nought by the Elizabethan English and by the Dutch, and called forth the '*Mare Liberum*' of Grotius, to which Selden replied by the '*Mare Clausum*' in support of the much narrower but still extravagant pretensions of England" (Westlake).

But in contrast with the boundless unowned sea we have the much-owned, boundary-ridden land with its innumerable partitionings, its many States, its great and petty sovereigns, and its endless owners.

The analogies available conflict with one another and a choice has to be made between them. Is the widespread air more like the sea expanse and therefore free, without a sovereign and not partitioned? Or, being set above the seething national States, is it divided by their boundaries, owned by their owners, and under the jurisdiction of their sovereigns? Regarded as a means of transit, is the air to be open and free and trackless as is the sea, or is it to be mapped out in routes and subjected to way-leaves, rights of way, and suchlike?

Coelum Clausum.

The adopted solution of this conundrum is something of a compromise. In principle the land analogy is followed, and the high skies are to be closed to all non-national traffic. *Coelum clausum* is to be the principle.

The skies of the future are to be painted with the colours of the flags which flutter beneath them. The fused glory of the evening sky, the canopy of heaven over the nations, is ordained to be hidden by a patchwork quilt having its underside circled and crossed with red, white, blue; spangled with stars and stripes; spotted with suns and crescent moons and still more stars; and bespattered here and there with blood-red rays and yellow, black, and green, and all the colours of the paint-box. Each small State will have a mansion in the skies to be its castle and eke its manger (if it chooses) to keep its dog in. The nations' hope of heaven is to exclude all others from it. That is the principle adopted.

Coelum Liberum.

The principle is largely qualified and almost rendered nugatory by a bargain between the States which are parties to the contract.

"Each contracting State undertakes in time of peace to accord freedom of innocent passage above its territory . . . to the aircraft of the other contracting States" (Art. 2).

Ifs and Buts.

But "the freedom of innocent passage" is hedged round with so many safeguards, so many qualifications and provisoes, and so many ifs and buts that it is hard to give the phrase a meaning. The right of passage only exists if the conditions of the Convention are observed and subject to regulations imposed by the subjacent State; areas may be prohibited to foreign aircraft for military reasons or for reasons of public safety; air thoroughfares (international airways) require the consent of the subjacent States; aircraft which pass from one State into another may be compelled to land in the latter; subjacent States may fix air routes for aircraft flying over them; aircraft signalled to land must do so. Finally, the right of innocent passage only exists in time of peace. "In case of war the provisions of the present Convention do not affect the freedom of action of the Contracting States either as belligerents or as neutrals" (Art. 39).

The Annexes.

Lest you grow wearied with matters of high and grave diplomacy the Imp will turn now to the lighter literature of the annexes. "The provisions of the present Convention are completed by the Annexes A—H, which

have the same effect and come into force at the same time as the Convention itself" (Art. 40).

The annexes, the Imp regrets to state, appear to be almost entirely an English production. "Regret" is the word the Imp uses because these annexes consist largely of pestilent rubbish. They include most that is bad in the English Air Regulations, though the zone blunder which the Imp pointed out has been rectified.

Annex E.

This contains the "Minimum Qualifications Necessary for Obtaining Certificates as Pilots and Navigators."

They include "A flight . . . during which the pilot shall remain for at least an hour . . . above the point of departure! Also, "A flight *without* landing around two posts (or buoys)." The former is not considered a test of skill; the latter is, though the Imp would consider a flight more skilful which was "*with* landing around two posts (or buoys)"!

They also include "A practical knowledge of international air legislation." A pilot must know the whole Convention and its annexes; he must satisfy the medical requirements—at the terminology of which, with its dioptres of hypermetropia, etc., the world has already laughed; and, worst of all, he must understand Annex G, compiled by the meteorologists.

Annex G. The Height of Profundity.

BBBDD FwwTT ALBMR wwVHS βbbF_1F_2
RRMMX (or RRmmX) ρTTHH

What! Meaningless to you, you say? And you claim to be a pilot! You'll have to change your avocation and be apprenticed to a pirate! Those symbols are but the alphabet of meteorology, without a knowledge of which it is impossible lawfully to fly. Besides these elements, you must learn aerostatics, orientation, azimuth, star globes, astronomy, astrology, astrolaby, chronology, chronometry, hour angularity, wet airology, drift, dead reckoning, live wangling, boxing the compass, swinging the lead, adjusting the truth and deviating from it and without precipitation, and so forth.

The Depth of Depravity.

A pilot who scarcely could jazzenough
Failed rightly to calculate azimuth;
His reck'ning was dead,
But his drift, it is said,
Was *di*-optres hypo or hypersuff.!

They told him he hadn't a heart,
Lungs, kidneys, or system of nerves,
Which—his hypermetropia apart—
Would yield him a good crop of curves.

They tested his knowledge of law,
Of the stars in their courses; and codes
They found out a serious flaw—
He had mixed up the ρ's with the Roads!

He didn't know β from Beer,
Couldn't hover or land around posts;
Though utterly void of all fear,
Faced examiners blanched as by ghosts.

It was true he had downed many Huns,
It was true he could fly like a beetle,
But—you can't bribe a bailiff with buns,
Or an Expert by showing you've mettle.

In all seriousness, the Imp considers the examination provisions imposed by our mandarins as either ludicrous or wicked. Ludicrous if intended to display the depth of the Expert's profundity; wicked if seriously intended to operate as—a red flag of the air.

If put to the test, the Imp would retort with Chaucer's reply to the eagle who offered to teach him the stars:

"Wilt thou lere of sterres aught?"
"Nay certeinly,' quod I, 'right naught,
And why? For I am now to old,
Elles I wolde thee have told."

THE AIRMAN'S AIRING.

(Being the Description of an aviator and his habits taken from a feuilleton).

It was a beautiful day for an air-trip, so Rudolph was up before sunset, pouring oil into the petrol tank of his trusty mechanical bird. He found a wire dangling loose between the planes, and deftly twisted it about one of the posts that help to hold an aeroplane together. His mechanics had not yet come in; but your true airman knows his machine, and is not dependent on paid servants.

He was alone!

In a moment he would be aloner still!

He sprang into his machine and touched a button.

The engine began to spin, and he felt a sudden thrill.

He was away!—a minute more and he was but a speck in the blue.

The engine raced, and the wheels spun round as he fled along the aerial highway.

Then, without warning, all was changed. The engine felt a sudden thrill, and Rudolph began to spin.

He felt the pressure on his safety belt, and knew that he must be flying upside down. His nerve was unshaken, however, and with great *sang froid* he righted the machine and continued his flight.

Rudolph was one of those rare and beautiful specimens of manhood—a civilian flier. He had steadily resisted the temptation to which so many young men yield in these days, to become a Service man.

"War," he would state nobly—throwing back his magnificent head and straightening his mighty shoulders—"is a dirty trade. It is always muddy in the trenches; and even in the air one is never sure but that one may accidentally fall into the mud."

So the noble fellow preserved his individuality, and remained unattached to any of the forces, of land, sea, or air.

On the day of which we write, he had scarcely been flying 10 minutes before he was overtaken by a high wind and driven into a bank of clouds. He completely lost his bearings—his machine was caught by the contending winds (pronounce wYnds) of heaven and blown hither and thither like a feather. Before many hours he had lost consciousness.

A cool breeze fanning his beautiful auburn hair restored him, and he regained his senses. At first he could not imagine where he was, but a careful examination revealed the startling fact that he was seated on top of a Zeppelin. It was clear to him that his machine must have turned upside down, and the breaking of the life-belt had caused him to fall—luckily while just over the airship.

But what was he to do? Thoughts of escape flashed through his mind, but none of them seemed feasible.

Just as he was giving up all hope a familiar sound caught his ear. His aeroplane—his faithful companion—had kept as close to his master as the somewhat unusual circumstances would permit.

Rudolph whistled, and the delighted aeroplane climbed up to him and taxi-d along the top of the Zeppelin till it came to rest by his side.

Rudolph felt his steed anxiously, but it was sound in wheel and wing, so he quickly mounted to his seat. The aeroplane seemed to understand what a duty it had to perform that day, and sprang forward with a sharp bark.

Steadily they flew till the spire of the town hall of Jubloppington came in sight—and their dangers were over past.

Once home, Rudolph donned his most civilian spotted tie and went to tea with his betrothed—this being Thursday.

"Dearest!" she cried, on catching sight of him—"I thought you were lost; you have been away four hours."—Mezzo Cammin.

AIRCRAFT FACTORY FOR SALE.

The American aircraft factory at Shaw, near Oldham, is for sale by private treaty. The factory covers six acres of land, and its buildings are mainly of brick construction with concrete floors and timber roofs covered with ruberoid.

NAVAL & MILITARY AERONAUTICS

GREAT BRITAIN.

FROM THE COURT CIRCULAR.

BUCKINGHAM PALACE, July 24th.

The King, who was accompanied by the Prince Albert, held an Investiture for the Royal Air Force in the Quadrangle of the Palace at 11 o'clock this morning.

The following Officers were severally introduced into the presence of His Majesty, when The King invested them with the Insignia of the Orders into which they have been admitted :—

THE DISTINGUISHED SERVICE ORDER AND THE DISTINGUISHED FLYING CROSS.—Major Lawrence Pattison, and Capt. Harry Goode.

THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE (Military Division).—Officer.—Lieut.-Col. Lionel Rees, V.C. (also received the Air Force Cross).

His Majesty then conferred decorations as follows :—

BAR TO THE DISTINGUISHED SERVICE CROSS AND THE DISTINGUISHED FLYING CROSS.—Capt. Cecil Darley.

THE DISTINGUISHED SERVICE CROSS AND THE DISTINGUISHED FLYING CROSS.—Major Anthony Arnold

THE DISTINGUISHED SERVICE CROSS AND THE AIR FORCE CROSS.—Capt Frank Fowler.

THE DISTINGUISHED SERVICE CROSS.—Lieut. Robert Peel.

BAR TO THE MILITARY CROSS AND THE DISTINGUISHED FLYING CROSS.—Capt. John Norton.

THE MILITARY CROSS AND BAR AND THE DISTINGUISHED FLYING CROSS.—Capt. James Slater.

THE MILITARY CROSS AND THE DISTINGUISHED FLYING CROSS.—Capt. Basil Catchpole, Capt. Frank Dutton, Capt Dennis Latimer, Capt. Cyril Lowe, Capt. James Mitchell, Capt Charles Robbins, and Lieut. Clifford McEwen.

THE MILITARY CROSS AND THE AIR FORCE CROSS.—Lieut.-Col. Reginald Mills, Major Cyril Patteson, Capt Eustace Grenfell, Lieut. John Boret, Lieut. Allan Boyle, and Lieut Charles Laing.

THE DISTINGUISHED FLYING CROSS.—Lieut.-Col. William Primrose, Lieut.-Col. Francis Roxby.

Capt. Christopher Brand, Major Kenneth Dowding, Major Evan Gilchrist, Major Wilfrid McClaughy, Major Francis Moller.

Capt. Robertson Affleck, Capt. Samuel Anderson, Capt. Thomas Angus.

Capt. George Bailey, Lieut. James Batting, Capt. Rene Bayley, Capt. William Benn, Capt Eric Betts, Capt. Robert Birkbeck, Capt Clifford Bowman, Capt. Edward Burling.

Capt. John Candy, Capt. Walter Carlaw, Lieut. Allan Churchman, Capt. Charles Cleaver, Capt. Eric Coles, Capt. Lawrence Coombes, Lieut. Herbert Coombs, Lieut. Philip Cummings.

Capt. Sydney Dalrymple, Capt Rupert Darnton, Lieut. Frederick Deane, Capt. Roger Delhaye, Capt. Euan Dickson, Capt. John Dickson, Lieut. Roy Dodds, Capt. John Doyle.

Lieut. Dudley Evans.

Capt. Ray Fagan, Capt. Karl Falkenberg, Capt. Ernest Fletcher, Lieut. James Foreman, Capt. Richard Gammon, Capt. Denys Gilley, Capt. Clive Glynn, Capt. Herbert Golding, Lieut Robert Gordon, Capt. Frank Gorringe, Capt. Arthur Groom.

Capt. James Hardman, Capt. George Harrison, Capt. Reginald Hellier, Capt. John Hopkins.

Capt. Harold Ireland.

Capt. William Jackson, Capt. Thomas Jefferies, Capt. Olans Johnsen, Capt. Norman Jones, Lieut. Reginald Jones

Capt. Francis Kempster, Capt Leslie King

Lieut. Charles Lavers, Capt. Walter Lawson, Capt. Harry Lett, Capt. Gwilym Lewis, Capt. Hugh Lloyd.

Major Donald MacLaren, Lieut. Finlay MacOuistan, Capt Frank McClurg, Capt. Thomas Middleton, Capt. Bertie Millson.

Lieut. Allen Nock

Capt. Harold Pearson, Capt James Pearson, Capt. John Pinder, Lieut. Walter Preston, Lieut. Harry Puckle.

Capt. Frank Ransley, Capt. William Redgate, Capt. Robert Reeve, Capt. George Reid, Capt. George Riley, Capt Leonard Rochford, Lieut. Herbert Rough.

Capt. Gordon Fox-Rule, Capt. Reginald Rusby.

Capt. William Samson, Capt. Alfred Sanderson, Capt. George Scaramanga, Capt. Thomas Sharpe, Capt. Percival Slater, Capt. John Austin-Sparks, Capt. James Sprott.

Lieut. Douglas Alliban, Capt. Charles Anderson, Lieut. Gerald Anderson, Lieut. Gordon Alps.

(To be continued.)

BUCKINGHAM PALACE, July 25th.

The following had the honour of being received by His Majesty :—Major-Gen. Sir Hugh Trenchard (Chief of the Air Staff), Brig.-Gen. C. L. Lambe (Director of Equipment, Royal Air Force) and Colonel A. M. Longmore, Royal Air Force.

BUCKINGHAM PALACE, July 26th.

His Majesty held an Investiture in the Quadrangle of the Palace at 11 o'clock.

The following were severally introduced into the presence of His Majesty, when The King invested them with the Insignia of the respective Divisions of the Orders into which they have been admitted :—

THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE.—Commander.—Military Division.—Lieut.-Col. Bryan Bartley, R.A.F.

THE DISTINGUISHED SERVICE ORDER.—Major Selden Long, R.A.F.

His Majesty then conferred decorations as follows :—

BAR TO THE DISTINGUISHED SERVICE CROSS.—Major Charles Bartlett, R.A.F.

THE MILITARY CROSS.—Major Stanley Clarke, Dorsetshire Regt., attd R.A.F.; Capt. Overton Preston, R.A.F.; Lieut. Basil Smyth-Pigott, R.A.F.; Lieut. Leslie Williams, R.A.F.

NAVAL.

ADMIRALTY APPOINTMENT.

JULY 24th.—Wt. Shipwts.—R. S. Cole, to "Pegasus," July 23rd.

It is reported that at Pulham Airship Station the Air Ministry is testing whether airships can safely be moored by the nose to a mast from which they swing freely instead of being housed in sheds. These mooring experiments are said to be proving satisfactory. R.24, one of our older rigid airships, has been at the mooring mast for about three weeks. The steadiness with which she has ridden out winds up to 40 miles an hour has impressed spectators.

* * *

The British Naval flying-boat F.5-N.00, Major W. G. Sitwell, D.S.C., R.A.F., in command, which left England on July 19th for Scandinavia, arrived at Helsingfors from Reval at 6 p.m. on July 21st.

* * *

On July 21st a British Naval flying-boat, Major Galpin, R.A.F., in command, arrived at Christiansand from Dundee, and proceeded to Christiania the same day. This boat was one of the two flying-boats which recently started on an official tour of Scandinavia.

Of the two F5 boats which left Felixstowe for Christiansand only one (N 4044) has been successful. N4041 during its flight from its base to Dundee was forced to descend in Orford Bay, and owing to a thick fog only arrived at Dundee Seaplane Base on the 13th, two days after her sister ship.

Both left Dundee on the 20th for the trip across to Christiansand, but N4041 was forced to return to the Tay. From there she has made several attempts to continue her flight to Norway, but has now been recalled to her base at Felixstowe. N4041 left Dundee on the morning of July 25th for Felixstowe.

The Air Ministry have apparently recalled N4041 owing to the inclement weather conditions.

* * *

A body has been washed ashore by the sea at Salthouse, Norfolk, and it is thought to be that of a Flight Sergeant of N.S.11. The Naval Airship Station at Pulham, Norfolk, has been advised.

MILITARY.

FROM THE "LONDON GAZETTE."

WAR OFFICE, July 17th.

REGULAR FORCES.—Oversea Forces.—Canada.—New Brunswick R.—Temp. Lt. (actg. Maj.) P. C. Sherren, M.C., ceases to be secd for duty with the R.A.F., May 2nd. 1st Cent. Ontario R.—Temp. Capt. G. M. Brawley ceases to be sec. for duty with the R.A.F., May 14th. Western Ontario R.—Temp. Lt. J. V. McKenzie ceases to be sec. for duty with the R.A.F., May 31st. Alberta R.—Lt. J. P. Cuninghame ceases to be sec. for duty with the R.A.F., July 2nd.

TERRITORIAL FORCE.—Hampshire Aircraft Parks.—Sec. Lt. A. L. Bird resigns his commn. and retains the rank of Sec. Lt., April 6th, 1918.

WAR OFFICE, July 22nd.

Temp. Hon. Capt. J. C. Pape relinquishes his commn. on ceasing to be empld., May 1st.

Transferred to unempld list:—Lt.-Col. (actg. Brig.-Gen.) J. A. Houison-Craufurd, C.M.G., C.B.E., June 1st; and is granted the hon rank of Brig.-Gen.; Lt. E. S. Pearse, July 24th.

The notification in "Gazette," July 11th, concerning Lt Col. J. A. Houison-Craufurd, C.M.G., C.B.E., is cancelled.

* * *

The Air Ministry are sending a mission to Germany to see that the provisions of the Air Clauses are duly executed. The mission will be under the command of Brig.-Gen. E A. D. Masterman. Colonel Smyth-Piggott, R.A.F., is the second in command, and among the other officers are Major Babington, R.A.F., Major Fleming, R.A.F., and Major Teed, R.A.F. The mission is said to number nearly a hundred officers.

* * *

The Air Ministry announced on July 28th that the Secretary of State for Air has approved a reorganisation of the Department of the Secretary to the Air Ministry, one of the principal objects of which is to provide more fully for the co-ordination of the work of the Department.

Under this reorganisation Mr. C. R. Brigstock and Mr. J. A. Webster, D.S.O., who had been transferred from the Board of Trade, have been appointed Assistant Secretaries.

* * *

Major-General Sir Frederick H. Sykes, Controller-General of Civil Aviation, was presented by General Duval, on behalf of President Poincaré, with the Cross of the Legion of Honour while attending a meeting of the International Aeronautical Commission in Paris recently.

* * *

A Handley Page Service machine, with a crew of two British officers and two mechanics landed at the Californie Aerodrome, near Nice, on July 23rd, when en route for Egypt. The machine had come from Istres, midway between Arles and Marseilles.

* * *

The Portuguese Government steamer "Sines" landed three British Aviators at La Coulette, the port of Tunis, on July 24th. Their machine had come down at sea some sixty miles from Malta owing to engine failure.

* * *

The Caproni aeroplane F.304 proceeding from London via Marseilles to Egypt fell into the sea off the coast of Italy, near Cape Mesco, owing to engine trouble, on the evening of July 26th.

The crew consisted of two English officers and two serjeants. The pilot, Lieut. Collinge, was fastened in the machine, and though he was eventually released by the efforts of his companions, who swam ashore, he expired soon after reaching the land.

* * *

General Corvisart, the French Military Attaché, Commandant Sablé, the French Attaché, and his Aide-de-camp; and Lieut. Alfred F Sinisoff, of the Esthonian Army, a member of the Military Mission, visited No. 1 Aircraft Constructional Wing on July 26th. They were accompanied by Major-Gen. Philip Game, Director of Training and Organisation in the R.A.F.; Colonel T. Gerrard; Major Moore, C.O. No. 1 Constructional Wing; and Sir Willoughby Dickinson.

The headquarters of No. 1 Constructional Wing are in the Camden Road, Camden Town, N.W., and mention has already been made of this training wing, which is affiliated to the 19th Bn (T.F.) County of London Regt.

The guests were conducted over the building in order that they might see how instruction is given.

Sir Willoughby Dickinson said that quite apart from the military needs in connection with aviation, which would always be heavy, there would be a great necessity for men to qualify in the art of flying for commercial and other purposes. Although the aircraft school which had just been established was only in the nature of an experiment, they were certainly justified in believing that it would be attended with big results. There must be thousands of boys longing to get up into the clouds, but before they could achieve that ambition they must learn aeroplane construction and master the science of aircraft.

Major-Gen. Game said he could see a friendly rivalry between the School and the Air Ministry in obtaining boys. The Air Ministry wanted as many boys as they could get between 15 and 16, and were willing to train them for three years. It would, therefore, be an enormous help if the School could assist the Air Ministry in this direction by instructing boys in aircraft.

Major Moore said they were also going to take up the teaching of wireless telegraphy at the School.

* * *

The South-Western area of the Royal Air Force held a successful sports meeting at the Victoria Park, Salisbury, on July 23rd, attracting large crowds of spectators. Some excellent racing was witnessed, giving promise of satisfactory displays in the forthcoming championships meeting which is to be held at Stamford Bridge.

Lieut. Paul (Gosport) and Sec. Lieut. Marsh (Blandford) tied in the high jump at 5 ft. 2½ ins.; and an excellent race for the mile resulted in a win for Acting-Corporal Nicks in 4 min. 50 secs.

Lieut. Price won the 100 yards in 10 1-5 sec., and the 100 yards open was secured by Serjt.-Major Bolt (1st Balloon Training School) in 10 3-5 sec. Lieut. Shaw (Gosport) proved an easy winner in the half-mile race in 2 mins. 10 secs. The one mile open was a splendid race, and was won by Lieut. Barr with comparative ease in 4 mins. 57 1-5 sec.

The long jump was secured by Capt. Scott (Boscombe Down) with 19 ft. 6 ins. Serjt.-Major Bolt won another good race in the 220 yards, which he won in 25 secs. Acting-Corporal Rider (Southern Aircraft Repair Depot, Farnborough) ran strongly in the three mile race, and won easily in 16 mins. 34 3-5 secs.

Lieut. Fraser won the hurdles, and Serjeant-Major Bennett (Lee-on-Solent) secured the 440 yards, after keen contest, in 55 2-5 secs.

The Southern Aircraft Repair Depot team from Farnborough, who recently competed at Olympia, and were defeated in the semi-final of the tug-of-war by Gordon Highlanders, exhibited good form, and, pulling strongly, beat Gosport in the final by two pulls to nil. A superb display of jumping was given by Mr. Singer, of Corsley.

The Warminster silver challenge cup, presented by friends in Salisbury to the Station winning most points, was secured by the Southern Aircraft Repair Depot, Farnborough; and the handsome cup presented by Brigadier-General Longcroft to the best individual competitor was awarded to Serjt.-Major Bolt.

The Earl of Athlone started the Windsor Marathon Race on July 26th in connection with the Royal Air Force sports at Ascot. The Marathon was won by Aircraftsman Ford, who crossed the tape at Ascot 41 min. after the start. Princess Alice, Countess of Athlone, distributed the prizes.

FRANCE.

The following is from a Paris correspondent:—

Rear-Admiral Violette has gone to Saint Raphael to study the question of formation of aviation uunits, and in particular that of the escadre (an escadre is about 200 machines). According to the result of his investigation, this unit of formation may be retained or suppressed.

On the 19th inst. Captain Marchal left St. Raphael to fly to

Bizerta, in Tunis, where he landed at 10.40 a.m. He flew a Nieuport Tellier machine with a 350 h.p. "Sunbeam," and carried Victor Giordan, his mechanic, as passenger. He intended to return the next day, but at the moment of writing no further news is to hand.

It is now understood that the French authorities have recognised the Adjudant Casser as an ace. Adjudant Casser has brought down a minimum of ten enemy machines. The authorities have only just discovered the graves of two aviators brought down by Casser in the spring of 1918. No definite information could be obtained before.

In a rather inglorious manner Lieut. Lemaitre has arrived at Dakar on board a tug, "La Calombe," having with him his passenger, Agt. Guignard, and his machine.

It will be remembered that Lieut. Lemaitre was forced to descend near Port Etienne, and crashed. Spares reached him here, but the necessary machines and tools to effect the repairs were not available, hence the reason for the sea journey to Dakar, where it is hoped the necessary mechanical equipment will be found.

GERMANY.

The following has been received from the Danish correspondent of THE AEROPLANE :—

The Bavarian officer-pilot, Lieut. Diemer, has carried out a number of altitude flights on a D.F.W. biplane scout, reaching first, with full load and a Benz motor, 23,250 ft. by a speed of 160 km., improving later this performance various times, having the power plant replaced by a B.M.W. motor, attaining the last time on June 17th a height of 9,620 metres (29,000 ft.) in 2 hours 4 mins.

On July 25th, 1918, this same officer flew, as technical officer of the Bavarian Flying School V., with a light two-seater biplane of the Halberstadt LCII model, equipped with a Bavaria IIIa 185 h.p. motor, and loaded with 80 kilos., from Augsburg to Doeberitz by Berlin in 4 hours 2 mins., on a petrol consumption of 84 litres. This is claimed to compare favourably with motor vehicles for service economy, as it is claimed that a 14/30 h.p. touring car (14 b.h.p., 30 i.h.p.) would need 12 to 14 hours and at least 120 litres for the same distance.

SCANDINAVIA.

The following has been received from the Danish correspondent of THE AEROPLANE :—

The Swedish Army has obtained a credit of 90,000 kronen for increasing the Swedish Air Services by buying foreign machines.

Both a Danish Army and Naval party have gone to Germany to inspect the cheap offers for aircraft with a view to acquiring aeroplanes for each service to the amount of £5,500 in German mark value, granted the Traffic Office by Parliament for air service trials. While the Army officers have so far acquired nothing, the Naval commission bought, beside a number of Benz engines, four Friedrichshafen biplanes, with which regular daily flights have been carried out during the last month both with and without mail, on the route between Copenhagen and Stege, to be extended to Nakskov, with only one mishap so far, one seaplane overturning while being brought after landing in a storm.

At the suggestion of the naval air station Captain-Lieut. v. Reppert has paid a flying visit to demonstrate the Brandenburg scout monoplane.

U.S.A.

During June a comparison of the casualties of the U.S. Air Service was issued at Washington, and the following table gives rates during the various periods mentioned :—

	Number	Hours Flown per Fatality
Training Fatalities—		
April 3rd to June 12th, 1919	8	2380
Other Fatalities—		
April 3rd to June 12th, 1919	14	462
All Fatalities—		
June 1st to November 11th, 1918	156	3149
November 11th to January 2nd, 1919	42	1877
January 2nd to April 3rd, 1919	21	1327
April 3rd to June 13th, 1919	22	1160

The U.S. War Department issued an announcement on June 30th regarding the number of aeroplanes in the U.S. Army Air Service. The following table from an American source shows the exact number of machines available for all purposes :—

Type	Designed for	Number in commission	In storage with motors taken out
D.H.4	Observation day bombing	1191	842
Spad	Pursuit	27	—
Le Pere.....	Service	18	—
Handley Page...	Bomber	4	20
S.E.5.....	Advanced training	46	57
J.N.6-H.....	Advanced training	653	156
S.4-C.....	Advanced training	400	—
	Total	2339	1075

RUSSIA.

OFFICIAL COMMUNIQUES (BOLSHEVIK).

JULY 23rd.—In the direction of the Northern Dvina an enemy aeroplane dropped 20 bombs on our positions.

JULY 25th.—In the region of the Northern Dvina an enemy aeroplane dropped 17 bombs without causing any damage.

UNDATED (WESTERN FRONT).—In the Gulf of Finland two of our aeroplanes successfully bombarded an enemy flotilla.

PERSONAL NOTICES.

NAVAL.

DEATHS.

WARNEFORD.—Captain W. K. Warneford, A.F.C., R.A.F., who was lost on July 15th, in H.M.A. N.S.11, was born in July, 1895, and was the only child of Mr. W. H. Warneford, of Huyton, Liverpool, manager of the London and North-Western Railway Works at Earlestown, and formerly at Crewe. He joined the Kite Balloon Section, R.N.A.S., in October, 1914, and, after service in France, was transferred to the Airship Service, R.N.

His service has been highly commended, and recently a letter was received from the Air Ministry congratulating the crew on their high state of efficiency and attention to duty. Captain Warneford was a cousin of the late Lieut. Warneford, V.C., R.N.A.S.

WRIGHT.—Lieut. James Turstin Wright, R.N., of Belsize Grove, London, commanding Barrow airship station, was killed when motor-cycling on Olney Island, on July 17th. He ran into a number of sheep which had strayed on to the roadway, and was thrown to the ground. Lieut. Wright was twenty-one years of age, and was to have left the service on the following Wednesday.

Lieut. James Turstin Wright, R.N., was the son of the late James Wright, of Derby, and Mrs. James Wright, of 2, Grove Court, London.

MILITARY.

MARRIAGE.

ASHMORE—PARSONS.—The marriage took place on July 17th, at Holy Trinity Church, Prince Consort Road, S.W., of Major-General Edward B. Ashmore, C.B., C.M.G., M.V.O., R.A., Commanding the London Air Defence Area, and Miss Betty Parsons, daughter of the Rev. F. W. Parsons, vicar of Tandridge, Oxted, Surrey, who performed the ceremony, assisted by the Rev. H. B. Coward (vicar of Holy Trinity) and Prebendary Joyce.

Mr. Alan Parsons gave away his sister, whose wedding gown was of gold tissue, with a train of gold brocade lined with tissue. In her hair was a pair of golden wings, mounted on a fillet of gold, which held the veil in place. This was the gift of Mrs. Alan Parsons. The bridal bouquet was of white lilies. The two little boy train-bearers were Master Ian David Parsons and Master Julian Cory-Wright, in flame-coloured chiffon shirts and loose breeches of gold tissue. They were followed by six bridesmaids, Miss Kathleen Govett, Miss Bet Joyce, Miss Aline Parsons, Miss Hope Robertson, Miss H. M. Smith, and Miss R. Gordon, whose dresses were in the Venetian style, of golden blue-shot tissue, worn with gold Dutch caps ornamented with clusters of tiny oranges and blue net veils. Their presents from the bridegroom were necklaces of lapis lazuli, and they carried delphiniums. A tiny child belonging to Mrs. Alan Parsons, in a classical costume with a gay little green toga, strewed rose-petals in the path as the couple left the church. The best man was Colonel Cyril Hankey, C.B.E., M.V.O.

Among the guests were :—The Spanish Ambassador and Mme. Merry del Val, the Countess of Limerick, Lady Randolph Churchill, Mr. and Mrs. Alan Parsons, the Hon. Gwladys Bailey, Sir Hugh Trenchard, Sir W. S. Brancker, Sir B. and Lady de Lisle, Sir A. and Lady Montgomery, Lady Tree, Lady Diana Duff-Cooper, Lord Bellew, Mr. Ivor Novello, Sir R. and Lady Longman, Mr. Gerald du Maurier, Miss Violet Loraine, Mr. and Mrs. Ernest Thesiger, Mr. and Mrs. Cory-Wright, Mrs. Charles Ashmore, Mrs. and Miss Ashmore, Mr. Eddie Marsh, General and Mrs. Romer, Mr. and Mrs. Govett, Sir William Treloar, General Geoffrey White, General Thomas Cubitt, Lady Bridge, Lady Butler, General and Mrs. Warner, Sir Cecil and Lady Harcourt-Smith, Miss Olga Lynn, Mrs. Delise Salmond, Mr. and Mrs. William Murdoch, Mr. and Mrs. Murray Davey, Mr. Boris Lensky, Mme. Suggia, Mr. Victor Beizel, Mr. Ley Smith, and the Staff and many officers of the London Air Defences.

There was a reception afterwards at 47, Prince's Gardens, the residence of Mr. F. Leonard Govett, the bride's uncle.

JACKSON—SLADE.—On July 23rd, in Dover Castle Chapel, Major James Lee Jackson, M.C., The Connaught Rangers and R.A.F., elder son of the Rev. Canon Jackson and Mrs. Jackson, The Rectory, Belmullet, co. Mayo, was married by special licence to Rosamond Tudor, second daughter of Edward Slade, Esq., and Mrs. Slade, The Tudor, Boston, U.S.A., and The Lake House, Quebec, by the father of the bridegroom, assisted by the Rev. A. S. Cuthbert Harrison, Chaplain, R.A.F.

ON TEMPORARY COMMISSIONS.

At last the first list of Permanent Commissions in the Royal Air Force has appeared in the "London Gazette." One says "at last" not in any spirit of reproach to those in authority, for one knows that the Personnel Department of the R.A.F. has done its best to hasten matters, but merely because now at last the period of suspense is over for some lucky individuals.

Those who are in the Permanent Commissions List know the best, but unfortunately those who have only been gazetted to Temporary Commissions do not yet know the worst. Nor can they know it for some years to come, for so long as they hold Temporary Commissions so long have they a chance of winning Permanent Commissions. For which reason it is to the holders of Temporary Commissions, and to those to whom Temporary Commissions have been offered, that this article is primarily addressed. Elsewhere in this paper will be found the conditions of service of Permanent and Temporary Officers, and of the Special Reserve.

The Stock Objection.

On all sides and from all sorts of people, when one is discussing Temporary Commissions one meets with one stock objection which runs, with minor variations, thuswise:—

"Supposing a fellow left school at the age of 18 or so, he is now about 23, and if he takes a Temporary Commission for four years he will find himself out of a job at 27 years of age without any knowledge of anything except flying. It is quite bad enough for him to start in now at 23 to learn a profession or to get a job. But what chance has he at 27? What a fool a man would be to take a Temporary Commission!"

Now, on the face of it that looks like an unanswerable argument. But is it? Not a bit of it.

The Answer.

Whether a man is a failure or not depends to a small extent on luck, to a greater extent on his own ability, but still more largely on his faith in himself and in his job. If he is made of the right stuff he will be a success. If he is not he will be a failure at anything.

Suppose for example a young pilot is in the Permanent Commission List to-day. Does that ensure his success in the world? Certainly not!

He may be a first-class pilot, and a very decent man all round, but if he has no administrative ability he can never become a Flight Commander, and he must retire at 30 or thereabouts as a lieutenant. And then he will be worse off than if he had had a Temporary Commission and had left the R.A.F. at 27.

Supposing he has some administrative ability and becomes a Flight Commander, but cannot handle men, then he cannot be promoted to command a squadron, and so he has to retire at 35. In which case he is in a still worse position. Again, if he becomes a Squadron Commander, but has not the ability to command a Wing, then he has to retire at 40. And, be it remembered, the competition for the few Wing commands which there will be in the R.A.F. on its reduced peace establishment will be very keen, so that only exceptionally good men can ever hope to become Wing Commanders.

Thus unless a man has very great faith in himself and does actually possess very considerable ability he cannot hope to be a success even with a Permanent Commission.

The Chances for the Temporary Officer.

On the other hand the man who only has a Temporary Commission to-day has in fact plenty of chances of success. In the first place, none of the Cadets from the promised "R.A.F. Sandhurst" can possibly qualify for commissions before 1923. Consequently all the Permanent Commissions which must be given during 1920, '21, and '22 must of necessity be filled from the Temporary List.

Furthermore, the present Permanent List is admittedly only a partial list. The exact number of Permanent Commissions cannot be fixed until (*a*) the League of Nations fixes the limiting size of the flying services of the world, until (*b*) the British Treasury fixes the limiting sum to be spent on the R.A.F. (which will certainly be smaller than the size allowed by the League of Nations), and until (*c*) the Air Ministry decides whether to spend that money on such material for the benefit of a big Volunteer personnel or on less material and a greater Permanent personnel.

Naturally therefore the present Permanent List is only an irreducible nucleus for the Permanent List which will be published after the Permanent Establishment of the R.A.F. is fixed. Therefore it seems that a goodly proportion of those now on the Temporary List will be placed on the Permanent List during the next twelve months or so.

Surely therefore it is worth the while of any man who has faith in himself to remain in the R.A.F. with a Temporary Commission until at least that next List is published. For all he knows he may only have missed being in the present List by a fluke, or because his immediate C.O. did not recommend him strongly enough, or because the C.O. who recommended him strongly is regarded by those still higher on the scale as being a man of doubtful judgment.

If he remains he may in the next year or so fall in with a first-class C.O. who recognises his merits and who may give him a chance of distinguishing himself. Then he will be fairly sure of a Permanent Commission in the next List.

Failing that, if he has the pluck to remain, he may himself so improve as he grows older that from being merely a very good pilot and a youngster of average intelligence at 23, he may be a very brilliant young administrator at 26, and so may be entreated to take a Permanent Commission and promotion. One knows plenty of men who have changed quite suddenly from being merely average to being very good during those critical years between 23 and 25. And *vice versa*.

At the Worst.

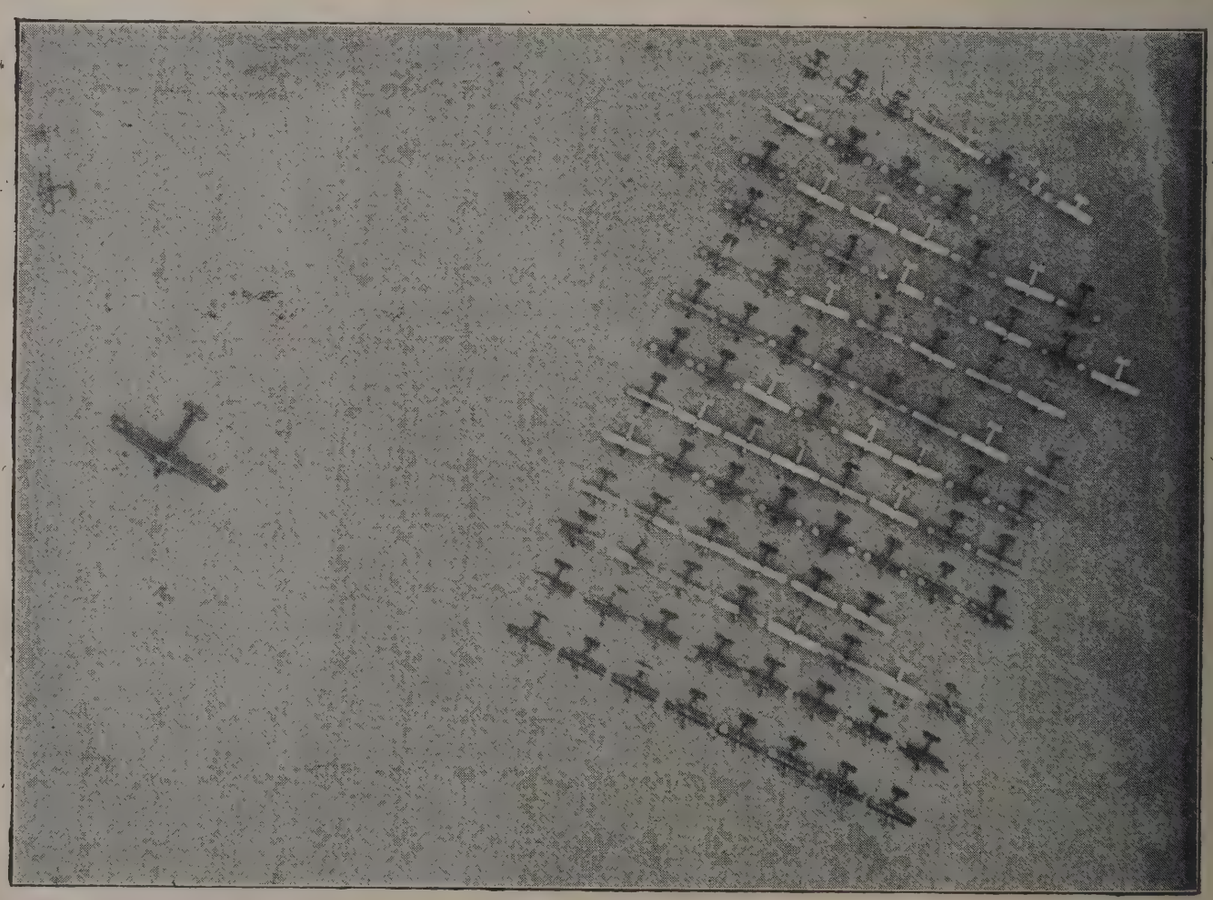
And even at the worst what happens? A Temporary officer is thrown out on a cold world in 1923 at the age of somewhere between 27 and 30. Is he half as badly placed as the man who is thrown out of the Army to-day at 40 or 45 to go and look for a job when nobody wants any men because Capital will not trust Labour and Labour will not trust Capital and so all enterprise and industry is at a standstill?

By 1923 either the country will be properly at work again or else the country will be bankrupt. In the first case he will have been well paid and well housed all through the difficult period before us. In the second he will be no worse off than he would be to-day.

Also, very many of the world's most successful men have made their success at a job for which they were not intended. In one's own small way one has had a modicum of success, at any rate one is not grumbling at the unkindness of Fate, yet one never did any editing till one was nearly 35 years of age, and one never wrote for publication until one was over 30. (One can hear one's enemies saying:—"Anyone can tell that by the way The Aeroplane is run.") At 29 one had not the slightest notion of ever making a living out of writing, and at 17 one's sole idea was to go into the Army—a misfortune from which the Army was saved merely by a financial accident. So one has no sympathy with the man who funks having to change his job at 27.

Faith in Aeronautics.

Still less has one any sympathy whatever with a man who has gone into one of the Flying Services because he is really interested in aeronautics and who funks leaving the R.A.F. in 1923. By that time the Aircraft Industry should be well round the corner after the coming slump and the resultant salutary weeding-out of weaklings, and any man who leaves the R.A.F. then will do so full of the latest aeronautical knowledge, with a growing industry waiting eagerly to give him a job.



If a man has neither faith in the R.A.F., nor faith in the future of aeronautics, nor faith in himself, the sooner he quits all connection with aircraft the better for himself and for aeronautics.

The man who has faith in aeronautics, but not much in the R.A.F. and only a little in himself, had better hang onto his Temporary Commission if he can get it, and use it as a stepping-stone to a job in the Aircraft Industry after the slump.

But the man who has faith in the R.A.F. and in aeronautics and in himself had better grab at his Temporary Commission, and install himself firmly in the R.A.F. with a fixed resolve that in the course of the next four years he is going to convince those in authority that they made a mistake in not giving him a Permanent Commission at once, but that he is quite willing to forgive them for their initial error so long as they recognise it by giving him rapid promotion.

Such a man is on the right way to become in due course Chief of the Air Staff after the present illustrious holder of that office has accomplished his great task of building a Third Service which is fit to serve the King. May it be many years before General Trenchard leaves his post as the head of the Royal Air Force, but when he does it would be fit and proper that he should be followed by one who has risen to that proud position from being merely an Officer on the Temporary List.

If all those who have had the good fortune to be selected for Temporary Commissions were to make it their aim in life to become some day Chief of the Air Staff, and were to order their conduct accordingly, then in a very few years the Royal Air Force would become worthy of its name.—C. G. G.

AN R.A.F. REVIEW HELD AT HELIOPOLIS, CAIRO, ON DEC. 23rd, 1918.—The Photograph shows Machines from all parts of Egypt, lined up, awaiting inspection by General Allenby.

THE PERMANENT AND TEMPORARY COMMISSIONS IN THE R.A.F. AND SERVICE IN THE R.A.F. RESERVE.

The Air Ministry makes the following announcement :—

It has been decided that officer personnel of the Royal Air Force will be provided for the present :—

1. By awarding a limited number of permanent commissions.
2. By granting 2,500 temporary commissions

PERMANENT COMMISSIONS.

A list of officers who have been awarded permanent commissions appears in the "London Gazette" to-day (August 1st), but there remain to be awarded a further number to officers selected from those now serving in Russia, those attached to the department of Controller-General of Civil Aviation and to the department of Director-General of Supply and Research, and in some special cases which are still under consideration. The question of the award of permanent commissions to officers serving with airships will be dealt with later.

A certain number of permanent commissions will also be awarded in about six months' time to selected applicants from among the officers who are then serving on the temporary commission list.

No officer on the permanent commission list has been awarded a commission in a rank higher than the substantive rank he held except second lieutenants who have been commissioned as lieutenants. The necessary adjustments will be made in promotion "Gazettes" at an early date.

Officers employed as stores officers will in future belong to the Quartermasters Branch of the R.A.F. unless they take up a flying qualification, and permanent commissions are only offered to these officers on this understanding. They will come under the rate of pay of the Quartermaster Branch, but will meantime be permitted to draw the higher rates laid down in the new scheme of officers on the general list until the position of each individual officer has been settled.

The new rates of pay and allowances in the case of officers given permanent commissions will run from August 1st, these officers for the present being paid through the same agents as now.

Officers who have hitherto held temporary commissions only are informed that the war gratuity issuable in their case will be on the scale for permanent officers as their war service will now reckon as pensionable.

Any officer accepting a permanent commission to which he has been gazetted must notify this fact to the Air Ministry (D. of P.) through his O.C. at the earliest possible date, and in any case not later than :—

(a) August 15th, in the case of officers at Home Stations.
(b) August 31st, in the case of officers with the Fleet in Home Waters or with the Forces of Occupation in France and Germany.
(c) Sept. 30th, in all other cases.

TEMPORARY COMMISSIONS.

The scheme of entry for temporary commissions is open :—

(a) To officers still serving who have not been awarded permanent commissions, and
(b) To demobilised officers.

It is not applicable to officers attached or lent from the other regular forces. Their terms of service in the R.A.F. will be dealt with separately.

As a general rule, candidates must not be more than 25 years of age on application, and must have qualified as flying officers. A limited number of officers of other classifications may, however, be selected. In the case of these officers the age limitation will not be enforced.

Employment will be for a period of three years. On the completion of two years of this service officers may be permitted, if desirous, to extend their services to four years in all. After the period of three or four years' service on the active list, officers will pass into the reserve for a further period of four years' service. During the period of service on the active list an officer may be called upon to serve in any part of the world.

Any officer who at any time is found to be physically unfitted for the duties of the R.A.F. may be gazetted to the reserve or out of the service.

Officers not desirous of completing their full period of service on the active list may, at the discretion of the Air Ministry, be permitted to transfer to the reserve at any time.

All candidates will be required to pass a medical examination as to their physical fitness before acceptance.

Any temporary commission granted under these conditions may be terminated at any time under the rules laid down in the Royal Warrant for pay and promotion of the Army.

Whilst on the active list officers entered under the above provisions will, for the purpose of rank and command, be on exactly the same basis as permanent officers of the R.A.F.

Officers will be eligible for promotion during their period of service if qualified in all respects under such conditions as may be laid down for permanent officers

Applications by officers already demobilised should be made on Form 168, which can be obtained on written application to Secretary, Air Ministry (P.O.S.), London, W.C.2.

Applications will be received at any time prior to the termination of the Army of Occupation period, but all applicants will be informed without delay whether their application is accepted.

Officers on joining will be brought on to the rate of pay of their approved rank.

The rates of pay and allowances and conditions of issue will be those normally in force from time to time for permanent officers of the R.A.F.

Service under this scheme will not affect the amount or date of issue of any gratuity which may otherwise be issuable in respect of past service.

As from August 4th, 1919, in the case of officers continuing to serve without a break from the war period, and as from the date of entry in other cases, officers will be eligible for a gratuity of £75 for each year's service and proportionately for broken periods. This gratuity will be payable to them on the completion of their period of services on the the active list—i.e., on passing into the reserve.

An officer placed in the reserve before the full period of his service on the active list is completed, either at his own request or for physical unfitness due to causes beyond his control, may be paid such gratuity as the Air Council may think fit, not exceeding the above scale.

Officers injured whilst on duty will be eligible for non-effective benefits under the same conditions as permanent officers. In any case in which a pension is awarded, however, the officer will not receive in addition the gratuity to which temporary service would have entitled him.

The widows and children or other dependents of officers killed whilst on duty will be eligible for the same pensions and allowances as would be applicable to the widows and children or dependents of permanent officers of the R.A.F.

Officers will be required to provide themselves with the uniform of their rank. No outfit allowance will be payable to officers entered under this scheme unless they are subsequently directed

THE R.A.F. REVIEW.—Another View of the Machines awaiting inspection. This photograph was taken from the roof of a shed.

to adopt a different pattern of uniform from that at present in force.

GENERAL.

Officers of the flying, technical, and administrative branches (including Staff officers) who :—

(a) Are not on the selected list for permanent commissions;
(b) Are not serving in Russia or with the Controller-General of Civil Aviation, and the Director-General of Supply and Research; and
(c) Have not applied for temporary commissions or for re-seconding in the case of officers belonging to the other regular services,

will be regarded as eligible for demobilisation as soon as their services can be spared.

Officers desirous of consideration under (c) should send in their names through G.O.C. of Area, or direct to the Secretary, Air Ministry, if unattached. Applications will be considered as they are received.

Officers of the regular forces may be re-seconded without prejudice to their subsequent return to their parent service.

While a small proportion of officers in the permanent commission list are not flying officers, and while some temporary commissions may also be awarded to officers who are not flying officers, the Air Ministry desires to point out that all officers given commissions who are not flying officers will, with the exception of certain technical officers, be required to qualify as pilots within 12 months from August 1st, 1919, the policy and intention being that in future all commissioned service, except Quartermasters service, within the Air Force will be undertaken by flying officers only. This is the reason why "flying risk" pay has been abolished.

Special regulations will be issued shortly governing the pension rights of officers holding temporary commissions in the R.A.F. who had served as commissioned warrant officers, warrant officers and ratings on regular engagements in the Royal Navy, or as warrant officers, N.C.Os., and men on regular engagements in the Army, including those who had been given commissions in the Army.

R.A.F. RESERVE.

An R.A.F. Reserve will be constituted consisting of three classes :—

(a) For flying officers.
(b) For certain technical officers.
(c) For general service duties.

The following conditions of service in the reserve are applicable only to officers entered under the special regulations for temporary commissioned service. Full Reserve Regulations will be published shortly.

Those in Classes (a) and (b) require to keep up to date in the latest development, and periodical re-qualifying courses are therefore necessary.

Flying officers entered under the foregoing conditions for temporary commissioned service will, on completing their period of service on the active list, be placed in Class A of the reserve for a period of four years. They may be permitted subsequently to re-enrol in this class up to the age of 30 if of the rank of captain or below, 35 if of the rank of major, and 40 if of the rank of lieutenant-colonel.

Officers will hold the substantive rank which they held at the end of their active service period. They will be required to present themselves at the nearest R.A.F. training station not less than two days in each quarter, and to carry out not less than 12 hours' flying per annum on up-to-date war-type machines. They will receive the full pay and allowances of their rank for each day upon which training is carried out, subject to the limitation that no officer will be allowed pay more than six days in any one quarter or 24 days in a whole year. In cases of accidents or injuries during such training, they will be eligible for non-effective benefits under the same conditions as permanent officers.

A retaining fee of £30 will be paid on the completion of each year's service in Class A of the reserve, provided that certificates are produced showing that the necessary flying and attendance has been carried out. This retaining fee will be held to cover all contingent expenses for upkeep, wear, and tear of uniform, etc. The customary travelling expenses will be allowed in addition for each occasion of training.

Any officer who for special reasons is unable to carry out his training in any quarter is to report the reasons in full for the approval of the Air Ministry. Except under exceptional circumstances no officers will be allowed to omit two consecutive quarters' training.

Officers unable for any cause to complete their full period of flying service in reserve Class A may be permitted to transfer to Class B or Class C of the reserve if considered suitable.

The object of Class B of the reserve is to provide technical officers on mobilisation for the following branches :—

(a) Engine and rigging.
(b) W/T and signals.
(c) Photography.
(d) Armament.

The officers of Class B of the reserve will, in the immediate future, be drawn from the following sources :—

(a) By the voluntary enrolment of a limited number of those who have served in one of the above technical branches during the war.
(b) By officers who transfer from Class A of the reserve either on completion of their service in that class or when they have been permitted to retire before completion of such service.
(c) From officers of the permanent list permitted to retire.

Officers who have completed four years' service in Class A of the reserve may, if below the rank of captain, be advanced to that rank on joining Class B. Enrolment in Class B will be for periods of four years, which may be extended up to the age of 40.

Officers in Class B will be required to undergo a technical course lasting for 14 days in each year at the R.A.F. technical school for their particular branch, and will be expected to pass a medium standard re-qualifying examination at the conclusion of the course.

Subject to satisfactory compliance with the provisions outlined in the preceding paragraph officers will receive the full pay and allowances of their rank for the period of annual training, together with an annual retaining fee of £20. This retaining fee is held to cover the incidental expense of upkeep of uniform, etc. They will also be allowed the customary travelling expenses for each occasion of travelling.

In cases of accidents or injuries during training, officers will be eligible for non-effective benefits under the same conditions as permanent officers.

Any officer who for special reasons is unable to carry out his period of annual training is required to report the reasons, for the decision of the Air Ministry.

Class C of the reserve is intended to provide officers on mobilisation for various duties not requiring up-to-date technical knowledge or skill.

Service in Class C of the reserve will be entirely voluntary. There will be no annual qualifying courses and no retaining fee. The age limit will be 50.

THE ROYAL AERO CLUB.

A meeting of the Flying Services Fund Committee was held on Monday, July 28th, 1919, when there were present :—Lieut.-Col T. O'B. Hubbard, M.C., R.A.F. (in the Chair), Mr. Chester Fox, and Mr. Harold E. Perrin (Secretary).

GRANTS AND ALLOWANCES.—The following Grants and Allowances were made :—

(110) A Grant of £10 to an Ex-2nd Class Air Mechanic in the Royal Flying Corps who had been incapacitated on active service.

(127) An allowance of £4 a month for six months to the mother of a Petty Officer in the Royal Naval Air Service who had been killed on active service.

(224) An allowance of £2 a month for six months to the mother of a 2nd Lieutenant in the Royal Air Force who had been killed on active service.

(225) A Grant of £8 and an allowance of £2 a month for six months to the widow of a Sergeant-Major in the Royal Air Force who had died on active service.

(234) An allowance of £1 a month for twelve months to the widow of a Sergeant in the Royal Air Force who had died on active service.

(235) An allowance of £2 a month for six months to the widow of a Leading Aircraftsman in the Royal Air Force who had died on active service.

(236) An allowance of £4 a month for six months to the widow of a 1st Class Air Mechanic in the Royal Air Force who had died on active service.

(237) An allowance of £2 a month for six months to the widow of a Flight-Sergeant in the Royal Air Force who had died on active service.

(238) An allowance of £1 a month for six months to the mother of a Private in the Royal Air Force who had died on active service.

(239) An allowance of £2 a month for six months to the widow of a Corporal in the Royal Air Force who had died on active service

COLONEL R. H. MORE, C.M.G.—A letter was read from Col. R. H. More, C.M.G., dated July 25th, 1919, resigning from the Committee. His resignation was received with much regret and the Secretary was instructed to write and thank him for his services on the Committee.

ROYAL GARDEN PARTY.

The members of the Flying Services Fund Committee were honoured with invitations to Their Majesties' Afternoon Party at Buckingham Palace on Friday, July 25th, 1919.

THE FLYING SERVICES FUND.

(Registered under the War Charities Act, 1916.)

ADMINISTERED BY THE ROYAL AERO CLUB.

For the benefit of Officers, Non-Commissioned Officers and Men of the Royal Air Force who are incapacitated while on duty, and for the widows and dependants of those who are killed or die from injuries or illness contracted while on duty.

HONORARY TREASURER :
The Right Hon. Lord Kinnaird.

COMMITTEE :
H.R.H. Prince Albert, K.G. *(Chairman).*
Mr. Chester Fox.
Lieut.-Col. T. O'B Hubbard, M.C., R.A.F
Lieut.-Col. C. B. Maude, R.A.F

SECRETARY :
H. E. Perrin.

BANKERS :
Messrs. Barclays Bank, Ltd., 4, Pall Mall East, London, S.W.1.

SUBSCRIPTIONS :	£	s.	d

The WORLD of AERONAUTICS

NEWS OF THE WEEK FROM ALL QUARTERS

The Royal Aero Club.

Mr. F. Hedges Butler, the founder of the Royal Aero Club of the United Kingdom, has received the following letter from the Hon. Sir Sidney Greville, Comptroller to His Royal Highness the Prince of Wales:—

"York House,
"St. James's Palace, S.W.,
"July 29th, 1919.

"Dear Mr. Hedges Butler,—With further reference to my letter of the 6th ultimo, with reference to the request that the Prince of Wales would become the Vice-Patron of the Royal Aero Club, I have taken an opportunity of submitting this to His Royal Highness, who desires me to inform you that he will have much pleasure in complying with the request.

"Believe me, yours very truly,
"SIDNEY GREVILLE, Comptroller."

F. Hedges Butler, Esq.

The Royal Aero Club of the United Kingdom was founded on Sept. 24th, 1901, by Mr. F. Hedges Butler and his daughter, Miss Vera Butler (now Mrs. Iltid Nicholl), and the late Hon. C. S. Rolls. During a balloon voyage at 5,000 ft. above the Crystal Palace, Mr. F. Hedges Butler suggested the formation of a club for the encouragement of aeronautics; the idea was immediately adopted by the rest of the party, and when a descent was made steps were taken to register the name. These pioneers scarcely dreamt that in so short a time progress in aviation would be so great.

H.M. King Edward VII gave permission to use the prefix "Royal" in 1910, and H.M. King George V is Patron.

A Wireless Telephone Demonstration.

Major-General the Right Hon. J. E. B. Seely, C.B., C.M.G., D.S.O., M.P., Under Secretary for Air, is arranging an exhibition of wireless telephones for Members of Parliament this week.

A wireless telephone receiving and transmitting set will be fixed in one of the Parliamentary Committee rooms, and an airship and one or more aeroplanes similarly fitted will fly over London. Another set will be fixed at the Air Ministry in the Strand. Members will then be invited to "ring up" the airship, aeroplane, or Ministry, as they choose, and converse.

One thinks that M.Ps. have too many chances of wasting time as it is. If some of the members who ask puerile questions in Parliament could be induced to "ring off," civil aviation might make more rapid progress.

Undraped.

A number of the "picture papers," which, as a cynic remarked, appear to be produced for people who cannot read, reproduced last week a photograph of a comedienne who, dressed only in a bathing costume, flew from Swansea beach in an Avro machine. Modest young pilots, who were not trained in the R.A.F., are now dreading that some other actress, jealous of the publicity that has been obtained, will disrobe more thoroughly and insist upon flying in a modern dancing frock.

Lapsus Carlinque.

The "Birmingham Gazette and Express" has published a review of "A Glossary of Aeronautical Terms" recently issued by the Royal Aeronautical Society. According to this newssheet:—

"The airman of to-day, if he takes the new language to heart, will describe a bad landing like this: 'After observing the isohels I struck an anabetic, and in a yawing moment stalled and nearly smashed my carlingue.'

"Which is another way of saying: 'After noting the lines of equal duration of sunshine I struck a breeze coming up the valley, and as the aeroplane moved angularly on its axis it came down with such a bump that I nearly fell through the bottom of the nacelle.'"

One suspects that by airman the newspaper means flying officer, and that "anabetic" is the printer's effort to render into type the word "anabatic." The attempt at sprightly humour makes one think of a tank trying to perform the shimmy shake.

More Imbecility.

At an "aerial circus" held on July 18th at Southsea Field, Americus, U.S.A., it is reported that Lieut. Alfred W. Vance, Officer in Charge of flying, at an altitude of 1600 feet gave an exhibition of climbing all over the wings of an aeroplane in flight, standing on the top wing, hanging from the landing gear, and sitting on the landing gear when the aeroplane landed.

Landing at the Amsterdam Exhibition.

The aerodrome at the Amsterdam Exhibition is very bad. In appearance it is good and flat, but, in reality, it is a bog. Before the first Handley Page machine, an exhibit, could land, it was necessary to walk all over the ground to find the least soft parts. A fair patch having been found, the machine was landed upon it. The machine ran a little too far. The right-hand wheels sank in up to their axles and had to be levered out and baulks of timber were placed under them. Meanwhile, the tail-skid had sunk in until the bottom of the fuselage was flat on the ground. This had to be levered out and baulked up. Then it was necessary to put down a timber road on which the machine was wheeled across the aerodrome to its stand in the exhibition.

British Sportsmanship.

A dinner was given by the American Flying Club at the Commodore Club, New York, on July 2nd, in honour of Lieut.-Commander A. C. Read, A.F.C., and the crew of the N.C.4, and also Commander J. H. Towers and Lieut.-Commander P. N. L. Bellinger and the crews of the flying boats that attempted but failed to complete the trans-Atlantic flight.

In the course of his speech Lieut.-Commander Read said:—

"One of the most important impressions of England was the sportsmanship of the British people. We had just captured the prize they had been hoping for. Perhaps here it might not be out of the way to say that Harry Hawker met me at the train, took the best care of me, and although the papers have more or less gone after him on account of some remark that he made, this remark was very well explained to me, and I believe the explanation to the effect that he was endeavouring to defend the British Admiralty for not sending boats out. Some paper had criticised them quite severely. They said that the American Navy sent out boats all over the ocean, the British Admiralty did nothing. He was a guest at luncheon and he wished to defend the British Admiralty without thinking of the backfire which his words apparently created."

Commander J. H. Towers, after speaking of the general organisation of the flights, said:—

"A great many people have asked me about the selections of the route. I am afraid I must assume responsibility for the selection of the route. The principal question was: 'Why go to England? When you fly to Lisbon, you cross the Atlantic, why not quit?' Well, I don't know really why I laid down the route that way. It just sort of seemed the natural thing to do, to end up the flight in England. And I should like to say to General Charlton this evening that had we known what we were going to get when we got to England, in the way of a reception, we never would have gone there, because he shortened our lives about ten years, he and his compatriots."

Major Connolly said:—"Mr. Chairman, through you, some of the membership desire to express this resolution, which in a way very crudely, extemporaneously, and imperfectly drafted, I think, typifies the breadth and the generosity of American sportsmanship, and American appreciation of great and worthy deeds.

"Resolved, that the American Flying Club at the dinner given by the club to commemorate the successful accomplishment of Lieutenant-Commander Read and the crew of the N.C.4, of the first trans-Atlantic voyage by air, in conjunction therewith extend to the Royal Air Force and the British Air Service organisations generally our congratulations and felicitations on the extraordinary accomplishment of Captain Alcock and Lieutenant Brown, respectively, in their successful and epochal trans-oceanic flight, and also the courageous and sportsmanlike effort of Harry Hawker and Lieutenant-Commander Grieve. We await with hopeful and hospitable anticipation the arrival of the R.34 and its gallant crew."—

Flying and Frailties.

A writer in the "Nottingham Guardian" rhapsodies thus:—

"To those who have not experienced the joy of flight, the sensation becomes difficult of description. The vast panorama of earth stretching away on all sides, the huge mountains of clouds moving slowly and with dignity through the vast spaces of the firmament, the exhilarating rush of air, the strangely joyous feeling of buoyancy and yet security, all combine to make of one a transformed creature, so that frailties are left behind."

The attention of Pussyfoot specialists in morality should be drawn to this.

MARTINSYDE

DESIGNERS OF THE FAMOUS

F4 FIGHTER

WHICH ESTABLISHED THE

FINEST PERFORMANCE

FOR CLIMB AND SPEED AT HEIGHT.

A ROLLS-MARTINSYDE

CARRIED GOVERNMENT DESPATCHES

FROM LONDON TO PARIS

IN 75 MINUTES.

COMMERCIAL TYPE A.

INQUIRIES INVITED FOR PASSENGER—OR MAIL—CARRYING MACHINES OF THIS TYPE.
SPECIFICATIONS WILL INCLUDE

285 H.P. ROLLS-ROYCE FALCON ENGINE, or
300 H.P. HISPANO-SUIZA ENGINE.

APPROXIMATE PRICE £2,500.

Note.—All above Types can be fitted with interchangeable land undercarriage or seaplanes.
SPECIAL PROVISION IS MADE FOR HOT CLIMATES.

Telephones—551, 552 and 553 Woking.

The WORLD of AERONAUTICS (continued)

R.A.F. v. Royal Aero Club Golf Match.

Teams of the R.A.F. Club and the Royal Aero Club played a match at Worplesdon on July 29th. The Royal Aero Club won the singles in the morning by six matches to one, and in the foursomes in the afternoon each side won two matches, so that the Royal Aero Club won on the day's play by eight matches to three.

The Royal Aero Club was very strongly represented, but the Royal Air Force turned up one short, and were very fortunate in finding a substitute in one of the best known players in the country. The match between this player and Major W. Graham Chambers proved the event of the morning play. Major Chambers is plus 5 at the Hamilton Club, Auckland, New Zealand, and is practically the best player over there. It was generally expected that he would lose to Captain "A. N. Other," but to everyone's surprise he actually beat him by 1 up. The results were :—

SINGLES.

Disarmed by a Smile.

U.S.A. Army pilots at France Field, Cristobal, Canal Zone, Panama, are required to do much of their flying over water and along the coast. A flight to the Gulf of San Blas, taking 3½ hours, was made recently by two R.9 hydro-aeroplanes.

It appears from the reports of the expedition that the mainland and numerous islands in and around the Gulf of San Blas, which is about 100 miles south-west of France Field, are inhabited by Indians who are suspicious and unfriendly and decline to trade with strangers. In view of this the machines would not have stopped there had it not been for the fact that one of the engines became overheated.

None of these people had ever seen or probably ever heard of a flying machine, and great consternation was manifested when they taxied up to the village. It is doubtful which side was the more afraid, for when the begoggled pilots stepped from their machines the entire population of the island was lined up on the beach armed to the teeth.

One of the pilots, who was a new arrival in Panama, however, and unfamiliar with the current yarns about the unfriendliness of the Indians, stepped on the beach, rushed up, and greeted the chief effusively. Fortunately his friendly smile was properly interpreted and the pilots were permitted to go through the village.

If the "begoggled pilot" was dressed in a Sidcot suit and helmet, one is surprised that even his "friendly smile" saved him from being clubbed. One has seen pilots in their full war paint who would have caused any Indian to sharpen his tomahawk.

A Fine Performance.

A magnificent non-stop flight from London to Madrid was made on July 31st. It was accomplished by an Alliance aeroplane fitted with a 450 h.p. Napier "Lion" engine. A start was made from the aerodrome near Acton at 7.15 a.m., and Madrid was reached at 3 p.m. on the same day. This performance—viz., 900 miles in 7¾ hours—must be regarded as extremely creditable.

The machine carried a letter from Princess Beatrice to her daughter, the Queen of Spain, and a gold cup which the company hope the Queen will accept as a memento of the first non-stop flight from her native land to her selected home. Copies of the "Daily Express" were also carried.

The pilot was Capt. Curtice, and the observer Mr. Peters, the designer of the machine, which was built for commercial and not for Service use. It was fitted with a similar type of Napier engine to that which won the Aerial Derby in June.

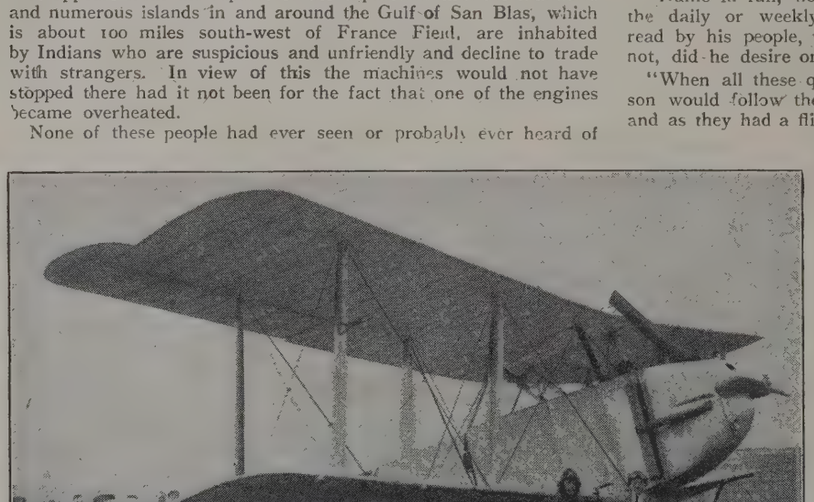
It is claimed that this is the first non-stop flight from London to Madrid, and anyone who has made that wearisome journey by train, even in pre-war days when the service was at its best, will appreciate all that the performance means. Long-distance flights such as this make the general public realise the enormous advantages of the modern machine. All concerned are to be congratulated.

The Alliance Aeroplane Co., which built the machine, is one of the group of aircraft firms of which Sir Samuel Waring, Bart., is the head.

Recruiting Methods.

It is interesting to note the methods adopted in the United States of America for obtaining recruits. These are described in the following official announcement :—

"In order to create enthusiasm and personal interest in the Air Service from all its enlisted men, Lieut. Floyd Wilson, formerly personal Adjutant and Publicity Officer here, now at Langley Field, Va., issued a mimeograph form asking that each enlisted man answer the following questions :—



"Name in full, home address (street and town), the name of the daily or weekly newspaper printed at his home town or read by his people, whether or not he has had a flight, and, if not, did he desire one?

"When all these questionnaires had been received, Lieut. Wilson would follow the activity of each enlisted man at the field, and as they had a flight, or attended a rigging class or any other interesting bit of news, this news was mailed to the town paper of the enlisted man, where it was eagerly printed by the newspaper, giving his name and address.

"If a cross-country flight was to be made to a town, instead of selecting any one to act as a passenger, Lieut. Wilson would refer to his roster and select a man that lived in the town to which the ship was going and appointed this man as passenger.

"The information was then telegraphed to the local newspaper in the home town that he was leaving in an aeroplane for home, this information the paper would gladly publish, with the result that many of the boy's friends in his town were anxious to be on the field when the ship landed and honour their hero who had only been in the Air Service 10 days perhaps, and was already flying around the country in a ship.

"This created a feeling of much satisfaction and pride in the enlisted man himself, and also a great amount of interest amongst his friends at home, with the result that Souther Field increased its recruits 32 per cent. in one week."

The Alliance Biplane (450 h.p. Napier "Lion") on which Captain Curtice and Mr. Peters flew from London to Madrid in 7¾ hours on July 31st.

ROLLS ROYCE

THE FIRST DIRECT ATLANTIC FLIGHT

VICKERS —VIMY— ROLLS

Telegram:

To ROLLS-ROYCE, DERBY.

Congratulations on performance of the two "Eagle" Rolls-Royce engines, which propelled the Vickers "Vimy" safely across the Atlantic.

ALCOCK & BROWN.

: A TRIUMPH FOR : BRITISH ENGINEERING

WARNING—CHANGES TO ROLLS-ROYCE CARS.

Rolls-Royce Ltd. have recently learned that attempts are being made by certain persons to "bring up to date" pre-war Rolls-Royce chassis by substituting for Rolls-Royce springs of ola type, cantilever springs which are not of Rolls-Royce manufacture; also by subs ituting other radiators and bonnets which are not of Rolls-Royce manufacture. Some of these changes have been brought to the attention of the Company, who have found them to be not only unsatisfactory, but possibly dangerous to the users. Owners who are asked to have such changes made to their Rolls-Royce cars, or potential purchasers of Rolls-Royce cars on which such changes have been made or may be suspected, should communicate with Rolls-Royce, Limited, 15, Conduit Street, London, W., and the Company will, for a small fee, inspect the chassis in question and inform the applicant what parts, if any, are not supplied by Rolls-Royce, and what the effect of such parts in their opinion is likely to be.

ROLLS-ROYCE Ltd., 14 & 15, Conduit St., LONDON, W.1.

The WORLD of AERONAUTICS (continued)

An Unusual Landing.

A serious accident was avoided cleverly by Capt. F. McCall, M.C., D.F.C., at the Calgary Exhibition, U.S.A., recently. He was flying with two boys as passengers over the fair ground when his engine failed and a crash among the crowd seemed inevitable. Describing the incident in the "Calgary Herald," he said:—

"Right ahead of me was the race track, around which the racing motors were going then at full speed. To land there was impossible without a terrible accident. On the other hand, farther ahead was a bunch of wires over the motordrome. I saw that in the short space I had to go it would be impossible to put on the power sufficiently to cause the machine to rise and clear those wires. It was either land or hit them. At the same time I saw no place to land except in the crowd in the midway or on top of a merry-go-round. It was that or nothing, so I cut off the power completely and just let her drop. It all happened in a second.

"We were without headway then, just dropping down, and we landed exactly on top of the merry-go-round. The merry-go-round has a conical top consisting of canvas stretched over iron rods radiating out from the centre. When the machine dropped on top of these, it was held there by the rods. We got down by climbing down through the rods on top of the merry-go-round engine and then to the ground."

A Yarn.

Captain W. G. Aston related the following story in the "Tatler":—

"Once upon a time, and, as they say in the more cultured circles, not so long ago neither, a Bristol Fighter was sent aloft on business connected with the testing of a self-sealing petrol tank. And a very necessary object, too. It was expected to land at an aerodrome not ten thousand miles from the north-west of London, and by and by a gentleman, whom we will call Captain Foxy, of a certain department, began to warm up the telephone wires with tender inquiries as to whether the Rafbird had effected a landing.

"Now it so happened that said pilot had stopped his engine a shade too soon, and could not start it up again, with the result that he alighted at the very farthest end of the ground, remote from his ultimate destination. So ultimately the inquiree announced that he *had* come down but that he had 'lost his prop.' 'Merciful heavens!' cries Captain Foxy, 'is the poor fellow killed?' 'Killed, no!' says the laconic aerodrome official, 'I only said he'd lost his prop.' After a considerable pause for thought Foxy takes immediate action. 'Will you,' he commands, 'go immediately to Handley Page's or Airco and see if you can get another propeller to replace the one he has lost? We had feared some great disaster had occurred.' After which the man at the other end replaced the receiver with difficulty and gave vent to the series of gurgling eructations which he imagines to be laughter. . . .

"The one and only Henery Knox told this yarn at the Royal Aero Club (where, if there is a fault to find, it is that the folk are terribly technically minded), and got the reception it deserved. When up spoke one who, ere now, had been known to be quoted as an authority on matters aerial. 'I don't know,' says he, 'but what, after all, there is a bit of sense in it. When this chap's *prop fell off* it's more than probable it would get a bit damaged and it might be risky to use it again!'"

Our Grammarians.

The "Practical Engineer" says:—"Th. four cross-Atlantic flights and the gallant failure has taught valuable lessons."

They has.

Coming Events.

August.

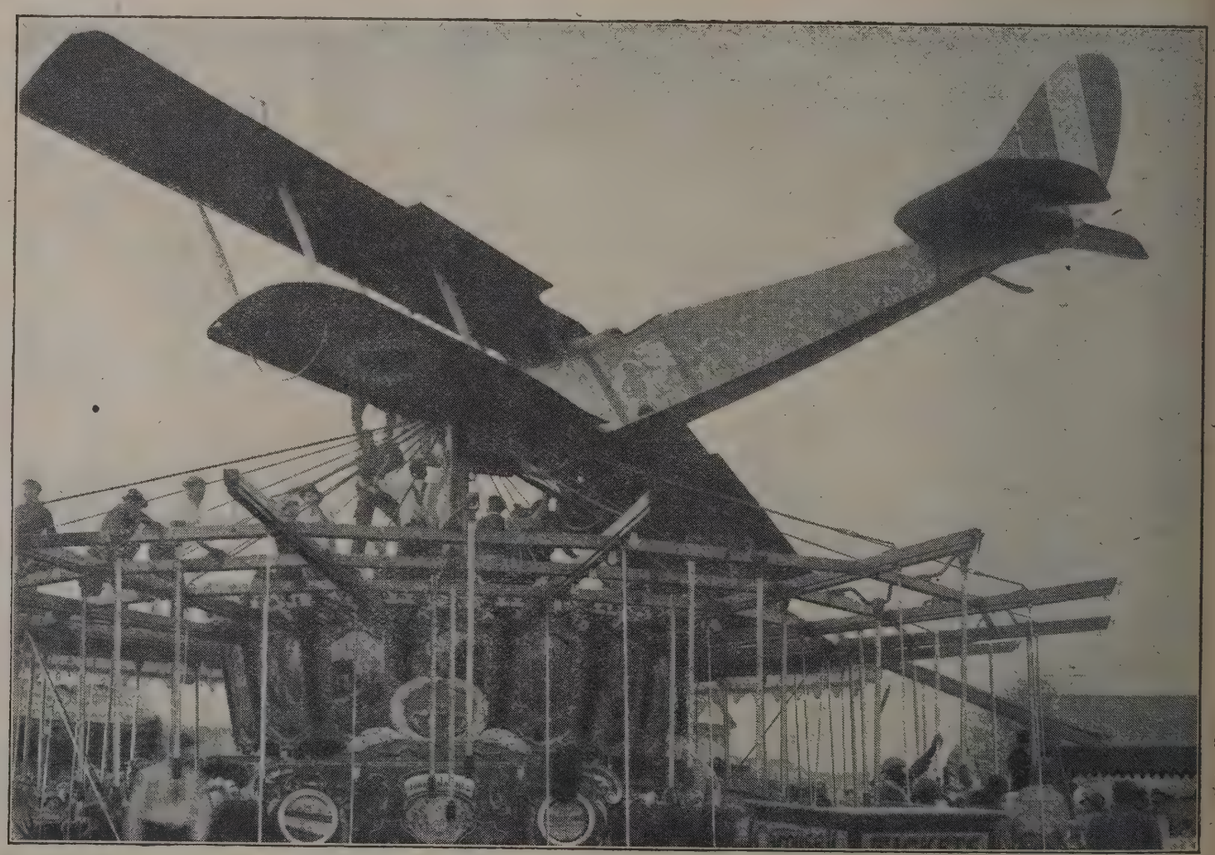
Amsterdam Aircraft Exhibition.

Saturday, August 16th.—R.N.A.S. Officers' (Hendon) Dinner at the Café Royal.

Thursday, August 21st.—R.A.F. Annual Athletic Meeting at Stamford Bridge.

Sunday, August 24th to Sunday, August 31st.—The "Avenir's" Tour de France Aérien is due to start.

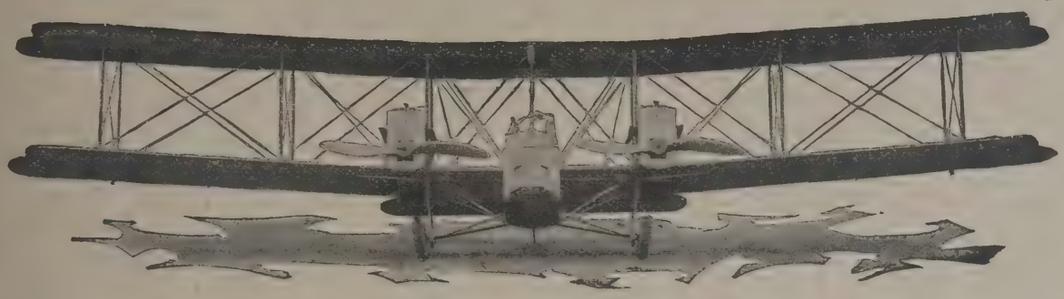
Saturday, August 30th.—Hendon-Brighton-Hendon Air Race at Hendon Aerodrome.



September.

Wednesday, September 10th.—Schneider Cup Competition, Bournemouth.

Saturday, Sept. 20th.—Hendon-Manchester-Hendon Air Race at Hendon Aerodrome.



Date to be Announced Later.

Hendon-Paris-Hendon Air Race.

How Capt. F. McCall, M.C., D.F.C., landed on a roundabout at the Calgary Exhibition, U.S.A. This was done intentionally to avoid a crash among the crowd of people.

A UNIQUE EXPERIENCE

COMPARATIVE RANKS IN THE RECENTLY BELLIGERENT ARMIES.

[So much confusion arises from mistranslations of the ranks in the various recently belligerent Armies that it seems well to set forth clearly in parallel columns the precise names of the ranks which correspond to one another. It is hoped that this information may be of use to readers.—Ed.]

Great Britain.	France.	Italy.	Russia (Imperial).	Germany.	Austria-Hungary.	Turkey.	Bulgaria.
Field Marshal	Marechal de France	——	General Feldmarshal	General Feldmarshall General Oberst	Feld-Marschall	Mushir	——
General	——	Generale	Polni-General	General der Infanterie General der Kavallerie General der Artillerie	General der Kavallerie General der Infanterie General der Artillerie	Birinji Ferik	General
Lieut.-General	General de division	Tenente Generale	General-Leitnant	General-Leutnant	Feldmarschal-leutnant	Ferik	General-leitnant
Major-General Brigadier-General (temp. rank only)	General de brigade	MaggioreGenerale	General-Maior	General-Major	General-major	Liva	General-major
Colonel	Colonel	Colonello	Polkovnik	Oberst	Oberst	Miralai	Polkovnik
Lieut.-Colonel	Lieut.-Colonel	Tenente Colonello	Pod-polkovnik (Regular troops) Voiskovoi Starshina (Cossacks)	Oberst-Leutnant	Oberst Leutnant	Kaimakan	Pod-polkovnik
Major	Commandant	Maggiore	Kapitan Rotmistr (Regular Cavalry) Yesaul (Cossacks)	Major	Major	Bimbashi	Major
Captain	Capitaine	Capitano	Shtabs-Kapitan Shtabs-Rotmistr (Cavalry) Pod Yesaul (Cossacks)	Hauptman Rittmeister (Cavalry and Train)	Hauptman Rittmeister (Cavalry and Train)	Yuzbashi	Kapitan Rotmistr (Cavalry)
Lieutenant	Lieutenant	Tenente	Poruchik Sotnik (Cossacks)	Oberleutnant	Oberleutnant	Mulazim-i-evvel	Poruchik
Second Lieutenant	Sous-Lieutenant	Sub Tenente	Pod-poruchik Kornet (Regular Cavalry) Khorunji (Cossacks) Praporshchik (Ensign of Reserve)	Leutnant	Leutnant	Mulazim-i-sani	Pod-poruchik

It is opportune to publish this table in the present issue of "The Aeroplane," as the new rank titles selected for use in the Royal Air Force are shown on page 559. No other nation has distinct rank titles for the aerial arms in the national forces.

The military ranks in the United States Army are similar to those in use in the British Army.

I WAS FINED £2 and COSTS AND LICENCE ENDORSED.

That was bad enough. for I am fully convinced that, if my Solicitor had possessed a thorough knowledge of Motor Car Law, the charge would have failed and I should have had a clean licence.

It was irritating to have a stiff solicitor's bill, a big railway fare, and a day's business loss. But what annoyed me most was my own neglect in not joining the Automobile Association, for I find that one of the many services the A.A. renders motor'sts is a strong FREE LEGAL DEFENCE.

They conduct motor cases in any police court in the Kingdom — that would have saved my railway fare and prevented a day being wasted; and they are experts in Motor Car Law.

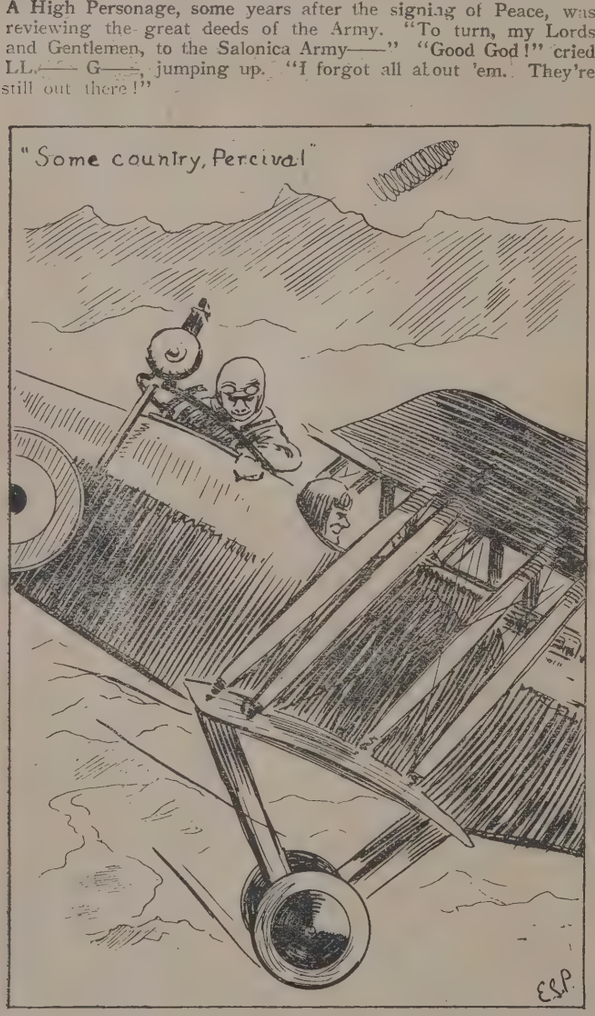
And all for a small yearly subscription!

Free Legal Defence and Advice is but one advantage of A.A. membership. Other privileges include Free Service of A.A. patrols, Roadside Telephones, Home and Foreign Touring Assistance, etc., etc.

If you are not a member of the A.A., send a postcard to-day to the Secretary, The Automobile Association, 41, Farum House, Whitcomb Street, London, W.C.2, for a free copy of "The Key to the Open Road," and learn how to motor in comfort and security.

THE R.A.F. IN THE BALKANS.

By "Struma."



When one returns home to find that there are Britons who are uncertain as to whether the Greeks were Allies of ours or not, and who are slightly foggy as to whether Johnny Bulgar was friend or foe, it is evidently time someone wrote a history of the war in the Balkans in particular, and of the European tribal squabble in general. Such, however, is not my intention. Some time hence, perhaps, when things have got into perspective, and more knowledge available, the historian will arise. "There are a thousand journalists," said Voltaire, "hardly have we two or three modern historians." At present, the public prefers its history in penny numbers at breakfast, and written, if possible, by Field Marshals or novelists.

Topographical Horrors.

All Macedonia may be divided into three parts: Bad, worse, and unspeakable. In the unspeakable portion, the British Army, officially described as the British Salonica Force, found itself exiled for some three and a half years, forgotten by the B.P., the journalists and the politicians. Here, with mountains to right of 'em, mountains to left of 'em, in front and behind 'em, alternately baked and frozen, drowned and parched, racked with malaria and dysentery, eaten up with bugs which fly and bugs which crawl, of astonishing variety of shapes and sizes, four and a half divisions of physically enfeebled Britons held up the wily Bulgar, backed and reinforced by the still more wily Hun. N.B.—By bugs that fly it is not intended to depict the R.A.F. nor its Hun equivalent.

Forgotten by the World.

And some of them are still there to this day. This forgetfulness on the part of the aforementioned three Estates formed the basis of the standard joke of the B.S.F. It ran somewhat thus: A High Personage, some years after the signing of Peace, was reviewing the great deeds of the Army. "To turn, my Lords and Gentlemen, to the Salonica Army——" "Good God!" cried LL—— G——, jumping up. "I forgot all about 'em. They're still out there!"

"Hardly do we guess aright at the things that are upon the earth"

106 in the Shade

The R.A.F. had not only the difficulties that the rest of the Army laboured under—the intense heat of summer, ranging up to 106 degs. in the shade, moist paralysing heat, disastrous to man, beast, and machine, the plague of flies, the mosquitos and consequent malaria—but also the joy of carrying on in a country in which flying conditions were, as an Italian aviator put it, absolutely incredible.

To the North, after one has passed the plains and hills that adjoin Salonica, one comes to a country that is a chaotic mass of mountains, rearing their rocky peaks to a height of over 6,000 ft., intermingled with smaller hills, countless gorges and ravines, stony beds of water-courses, dry in summer, but raging torrents in a few minutes after heavy rain; rivers, marshes, and lakes. Two important valleys cross this chaos towards the sea, those of the Vardar and Struma, the former justly celebrated for its infernal wind.

Aerial Fighting.

For three years the belligerent lines, with a strange air of permanence, were to be seen crawling over hills and valleys from the Adriatic to the Ægean, *via* Monastir, Doiran, the Struma, and Lake Takinos.

Conditions being so different to those in France, air fighting was not so much in evidence, though probably, considering the total number of machines on the Front on both sides, it was proportionately as heavy. I do not know what the total number of enemy machines brought down would amount to; perhaps somewhere near a hundred. The figures from September, 1916, to August, 1917, show that 36 were accounted for, and slightly more for the next 12 months, amongst them being some big twin-engined machines.

I remember one of these big fellows used to come over our lines regularly when the conditions were good, and proceed calmly up and down for quite a considerable time, the while the sky was prodigally spangled with shrapnel. Although at somewhere near 20,000 ft., his movements were perfectly visible in the clear Macedonian air, the sun flashing on his 'planes as he turned. When our machines, laboriously climbing, had reached a couple of thousand feet or so below him, he would quietly make off home, having seen all he wanted.

The Habits of the German.

The Boche aviator, it must be conceded, showed a considerable amount of enterprise, though he must have looked upon the operations as a sort of stalemate, and was occasionally inclined to take things easily. But there is no doubt that with a larger force he could have made things decidedly uncomfortable. His machines were, for one thing, as a rule, more up-to-date than either ours, the French, or the Italian, though the latter had some good specimens.

On several occasions he left a decided mark on us, as in the two raids when the camps round Salonica were heavily bombed by 15 Albatroses each time, Summerhill being severely strafed, and the enemy getting well away on each occasion. He constantly appeared over the town on reconnaissance bent, and on three consecutive nights, just before the offensive last September, bombed the docks and shipping, though without doing much damage. The anti-aircraft gunnery, of both the Fleet and the

TRANSITIONS IN TRANSIT

No. 1. **The Tea Clippers of the 'Sixties.'**

A toast, gentlemen, to the glorious memory of the old East Indiamen — "Cutty Sark," "Black Adder," "Sir Lancelot" and the rest—may their grand old timbers rest in peace. And here's to the splendid sea dogs who manned them, raced them halt round the world to be first into the Port O' London with the new season's tea. The men who were not content with t'gallants and royals, but set skysails and moon-rakers in the teeth of the hurricane.

From Foo Choo to the Port O' London in 100 days,—record time! And nowadays the same journey can be done in 100 hours—by aircraft! The time is not far distant when the produce of the East will be brought home by aeroplane.

The machine illustrated above is the Nieuport Mark VI. Seaplane.

Army, either by day or night, was of a kind to make one weep, though they certainly had a Zeppelin to their credit.

Allied Bombing Methods.

As a bomber, however, the Boche was distinctly inferior to the Allied aviators, the raids carried out by the British, French and Italian squadrons, and the Serbian and Greek detachments, being very numerous and effective. To take as an example, a short period of 12 days in April, 1917. In that time heavy bombing was effected at Pravista, Porna, the great aerodrome at Drama, dumps and stores at Bogdanci, the big dumps and aerodrome at Hudova, camps and batteries at Cestovo and Gradeshnitza, convoys in the Rupel Pass and in the neighbourhood of Doiran, and four enemy machines brought down in combat. On some of these occasions our machines descended to 400 ft., and very great damage was inflicted. And that, be it noted, is not picked out as a period full of "fixtures," but taken quite at random.

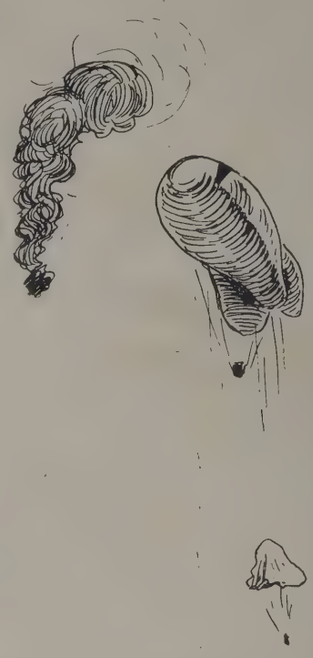
The R.N.A.S. Detachment.

The machines of the R.N.A.S. were quite as active, strafing considerably the enemy lines and establishments in the vicinity of Kavalla and Lake Tahinos.

Photography.

Next in importance to bombing—or even before it—was the work done in photography. Ten thousand photographs were taken which, thanks to the clearness of the atmosphere, were of super excellent quality.

Well do I know them. They were to me one of the minor horrors of the war. They formed a complete photographic map of the enemy lines, continually brought up to date, and were also used in lieu of the ordinary methods of survey for a good deal of the work in maps produced by the R.E., Macedonia being an almost unknown country as far as modern large-scale maps are concerned. Every dump, railway, aerodrome, auto-park, camp and bridge, far in rear of the lines, being recorded. They were passed on in the form of "mosaics," mounted on huge sheets of brown paper, to the General Staff "Intelligence," those Organisers of Victory, to perform their conjuring tricks with. (Attached please find one sketch of an Organiser of Victory, complete as fitted.) So vast did this collection become that it was confidently expected that the unfortunate wight in charge would be found one fine morning extinct under a pile of them. Fortunately for him there came the Armistice.



General Staff "Intelligence"

Besides this number of photographs taken by the Photographic Section of the 16th Wing, there were those of the French Service d'Aviation, and a considerable number taken by the Greeks, who, like the Serbs, had a creditable aviation service. A lot of work, too, was done by the R.N.A.S

The French Machines.

The French, like ourselves, did not seem to be blessed with ultra-modernity in their machines, their chief aeroplane seeming to be the A.R. or A.L.D. (type Corps d'Armée), with Renault or Lorraine-Diétrich engines, a fairly large machine distinguished by the backward stagger of the 'planes; not, however, excessively up-to-date. The Italian flying corps was, as usual, very efficient, but, if they had had the opportunities, it is doubtful whether they could have produced in Macedonia a squadron of virtuosi like unto "La Serenissima" of Vienna fame. The S.V.A., by the way, is undoubtedly a fine machine.

Kite Balloons.

Kite balloons are always a source of amusement to the ordinary soldier, and painful as it is to record, the sight of one of his own "sausages" in difficulties was always an awful joy to Tommy.

He failed to see the use of them, and by bitter experience got to regard them as objects expressly designed to draw artillery fire. We had three all to ourselves, that is to say, divided between four and a half divisions, which is perhaps not excessive, but quite lavish as compared with the usual distribution of material to the B.S.F.

Our own particular "Rupert" on the Doiran Front was frequently the target for "Balkan Lizzie." This long range gun, of a calibre of 8.5 or thereabouts, was one of the chief attractions of those parts, and under skilful aeroplane direction would play havoc with the dumps, knock up the railways, take long shots at the aerodromes, which, however, were just beyond her range, and generally put the wind up the units behind the lines. Often was she "located," and often "put out of action" by judicious bombing, only to reappear merry and bright a day or two afterwards. It is doubtful whether she was ever really located, at any rate, until the offensive when I saw fire diagrams, I believe, of this very gun amongst captured Bulgar maps. She remained, until we swept over that part of the country, as something of a mystery, and an exhibit to be shown with pride to newcomers on that Front. "Lizzie" knocked holes in "Rupert" several times at a range of seven miles, and the descent of the "chap in the clothes-basket" was considered by connoisseurs to be quite good for a free performance. One of these balloons was also brought down by a bold and skilful German aviator.

The Final Advance.

In no other theatre of war had the R.A.F. so difficult a task as in Macedonia. The whole Allied Army of the Orient can justly pride itself that it contributed fully as much as any Force to the final overthrow of Germany. And when the Serbs in the great offensive broke through to the west of the Vardar, performing such feats of fighting and marching as modern warfare has rarely known, in company with their French and Greek Allies, then the costly British attacks on the impregnable Doiran positions were justified.

Then, their only line of retreat threatened by the victorious Allies, the Bulgars began their retirement from before the British

Above Lake Doiran. The Bulgar trenches are in front of the town. In the background, the Beles Range. 5000 to 7000 ft high.

Front, and the great chance of the flying men came. Over a great stretch of road crowded with troops and transport of every description, bullock carts and horse wagons, motor vehicles, infantry, artillery, the bombing machines cruised, and the terrible condition of this road for days afterwards bore evidence to the deadly thoroughness of their work. To the brilliant success of this two weeks' campaign, with its total of 900 guns captured and 100,000 prisoners, the R.A.F contributed as much as any arm, and with the rest of the B.S.F., can justly ask for some better recognition than the studied neglect and even ridicule with which this fine portion of the British Army has been treated.

By the collapse of Bulgaria and its immediate consequences, the surrender of Turkey and the downfall of Austria, the Armies of Macedonia drove the final wedge into the tottering German fabric, and were the first—and, indeed, the only—Force to march victoriously on enemy soil in Europe.

A LONG FLIGHT.

The most extended flight yet planned by the Air Service of the U.S. Army, in the interest of recruiting, charting of routes, and the locating of landing fields, is contemplated by Lieut.-Col. R. S. Hartz, J.M.A., A.S.A., Commanding Officer at Bolling Field, Washington, D.C. The aeroplane used will be a U.S. Martin bomber.

The flight as planned will total 7,805 miles as follows:—Washington, D.C., to Miami, Fla., 1,120 miles; Miami, Fla., to San Antonio, Tex., 1,140 miles; San Antonio, Tex., to San Diego, Cal., 1,120 miles; San Diego, Cal., to Seattle, Wash., 1,170 miles; Seattle, Wash., to Duluth, Minn., 1,375 miles; Duluth, Minn., to Augusta, Maine, 1,345 miles; Augusta, Maine, to Washington, D.C., 535 miles; total 7,805 miles.

AFFILIATED AERO CLUBS.

The Directors of Aero Stations, Ltd., all of whom have been actively engaged in the Aircraft Industry since 1908, have for years past been selecting suitable sites for landing places for aircraft adjoining the principal commercial centres of Great Britain.

It is the policy of Aero Stations, Ltd., to render these places self-supporting, pending the development of commercial aviation, by running each aerodrome as a County Sporting Club.

Such a club was organised before the war at Shoreham between Worthing and Brighton, but during the war the premises were taken over by the War Office. This club, the Sussex County Aero Club, has now been reorganised, and will constitute a model for the clubs to be established on the outskirts of other large towns.

Clubs have been registered as Proprietary Companies at the following places:—Aberdeen, Bristol, Birmingham, Carlisle, Derby, Dundee, Edinburgh, Exeter, Folkestone, Glasgow, Grimsby, Inverness, Ipswich, Leeds, Liverpool, Manchester, Newcastle, Norwich, Plymouth, and the Sussex County at Shoreham.

The Affiliated Aero Clubs of the British Empire, Ltd., are to provide £200,000, and of this sum £10,000 is to be devoted to starting each of the above clubs. Shares in the above company can be bought, and shareholders holding not less than 200 £1 shares have right of membership of all the clubs free of subscription.

G. Arthur Wingfield, Esq., is a Director of the Affiliated Aero Clubs, Ltd., and Chairman of the Sussex Aero Club, Ltd., and Flying Transport, Ltd. He has done much good work for aviation, and was one of the "moving spirits" in the Sussex Club, which was established before the war.

The Sussex County Aero Club's new aerodrome adjoins the old position which is now an R.A.F. aerodrome. The Club House is a substantial farm-house with four cottages and large well-built dairy buildings, and the architects estimated that £20,000 would cover all the necessary alterations, laying out the grounds, golf course, tennis lawns, etc. The grounds cover 150 acres.

Bungalow Town adjoins the flying ground, which is within half an hour's flight of London, and within a very few minutes of Brighton, Hove and Worthing.

The sea and a large expanse of smooth tidal water are available for seaplanes and motor-boats.

It is intended to develop the Club as a Country Club on the lines of Ranelagh, Hurlingham, etc.

An affiliation arrangement has been completed with the London Flying Club at Hendon. The Club will be unofficially reopened on September 6th.

FORECASTS OF FLYING MACHINES.

Some interesting correspondence has appeared in the "Scotsman" recently dealing with forecasts of flying machines. The following letter appeared in the issue of July 28th:—

Sir,—Last year I saw and heard an airship passing over my house. I returned to my book, "Lectures by Dean Ramsay," and, by a strange coincidence, the passage before me was the following—it occurs in the lecture on "Social and Moral Influences of the Iron Road":—

"There is a very remarkable passage on the subject of steam and its agency for mankind in Dr. Erasmus Darwin's 'Botanical Garden,' a poem little known to the present generation. . . . In the year 1793 Dr. Darwin thus wrote of steam and its powers, then only just coming into effect:—

"'Soon shall thy arm, unconquered steam! afar
Drag the slow barge or drive the rapid car.'

"Thus Dr. Darwin distinctly, in 1793, predicted what has come to pass since his day—steam navigation and land locomotives. It was a remarkable prediction and remarkably accomplished. But Dr. Darwin predicts also steam conveying men by air as well as by land and water. In a note he says:—'There is reason to believe it may in time be applied to the rowing of barges and the moving of carriages along the road,' and then, very coolly, adds, 'as the specific levity of air is too great for the support of great burdens by balloons, there seems no probable method of flying conveniently but by the power of steam or some other explosive material which another half-century may invent.' And upon this idea he proceeds in the poem to describe ladies shaking their pocket-handkerchiefs to friends below them out of the flying chariots, and armies on land looking with dismay on the arrival of troops coming to reinforce their enemies' ranks by a steam aerial transport. He looks forward to the time when the unconquered arm of steam

"'Shall on wide-waving wings expanded bear
The flying chariot through fields of air,
Fair crews triumphant leaning from above
Shall wave their fluttering 'kerchiefs as they move,
Or bands alarm the gaping crowd
And armies shrink beneath the shadowy cloud.'"

We may say that we have seen this "remarkable prediction remarkably accomplished."

W. M. S.

To "Aeroplane" Subscribers.

Since the Armistice, the subscription list of the AEROPLANE has steadily increased: an eminently satisfactory development which we are anxious to encourage.

Of the many books published on the war on the Western front, none conveys a more realistic impression of the work of a particular arm than FLYING COLOURS by Captain H. M. S. Saundby, A.F.C., R.A.F., M.C., published at **£2 2s.** net (Edition de luxe) and **15/-** net (Popular Edition).

Among the art books published in the last year or two, none can claim to be a more faithful reproduction of the artist's colour scheme and that indefinable thing atmosphere.

FLYING COLOURS is a permanent memorial of the life of "the pilot in action," as Major-General C. B. Ashmore calls him. It was very costly to produce, and necessarily the price to the public had to be high.

Many would like to possess it who do not feel disposed to put down Two Guineas for the larger edition or Fifteen Shillings for the smaller.

How to meet their views? We make a special offer to any subscriber for one year to the AEROPLANE: namely to give him the right to purchase either edition at half price.

All he need do is to send us the accompanying order form with cheque for one year's subscription, plus **£1 1s.** or **7s. 6d.** according to the Edition he wishes to have.

In order to be fair to current yearly subscribers we extend the half-price concession to them also. If a subscriber has paid a quarterly or half-yearly subscription, then to secure the right to participate he should send the balance for the year.

Subscribers who have given their orders through the trade, and not direct to the AEROPLANE Office, must sign the form below or a copy thereof, and hand it with the balance on account of the book to their retailer for transmission to the AEROPLANE.

If the subscriber already has a copy of FLYING COLOURS, and would wish to take advantage of this offer, then he may secure McCudden's "Five Years in the R.F.C." **(7s. 6d.)**; Richthofen's "Red Air Fighter" **(3s. 6d.)**, and Gill's "The Aerial Arm" **(6s. 6d.)** at half price, *i.e.* **8s. 9d.** the three, plus the year's subscription to the AEROPLANE.

ORDER FORM.

To THE "AEROPLANE,"
61, Carey Street, W.C.2.

Please send me the "AEROPLANE" for one year post free **(30/- inland; 35/- abroad** and one copy of the { Edition de luxe / Popular Edition } of FLYING COLOURS at half price { **£1 1s. 0d.** / **7s. 6d.** } for which I enclose remittance value **£ s. d.**

SUNBEAM-COATALEN AIRCRAFT ENGINES

are fitted to H.M.A. R.34

The wonderful achievement of R.34 in making the double journey across the Atlantic affords ample proof of the efficiency of Sunbeam-Coatalen Aircraft engines and machinery. This was no single flight of a few hours' duration, but a voyage of 183 hours. Never before have any aircraft engines had to withstand such continuous strain.

Having twice crossed the Atlantic, made numerous patrols and trials, and journeyed from end to end of Germany, R.34 has travelled a distance roughly equal to 15,000 miles or 300 hours' actual flying—every performance on SUNBEAM-COATALEN Aircraft Engines.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AIRCRAFT FINANCE AND COMMERCIAL AERONAUTICS AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER.

THE WEEKLY COMMENTARY.

In a leading article "Strasbourg" comments upon the monopoly of technical knowledge which the Technical Department of the Air Ministry appear to intend to create.

He disposes of the plea of military necessity for maintaining secrecy on such a subject in a manner novel and ingenious, though little complimentary to those charged with the direction of military affairs.

The machines produced by the Fairey Aviation Co., Ltd., under the direction of Mr. C. R. Fairey, form the subject of this week's instalment of "Modern British Aeroplanes."

It is noteworthy that Mr. Fairey has produced a large number of seaplanes with quite different characteristics by using a quite limited number of standard components, and that the machines thus turned out have by no means suffered in performance.

An illustrated description of one of the latest German multiple-engined machines, with a short historical account of its development, is given on page 531.

This machine is of a type not yet in use in this country, in that the power plant is concentrated in the central fuselage and drives the airscrews by gears and shafts.

Difficulties with the transmission gear were encountered, but German engineers, unlike their British rivals, were permitted to overcome them.

ON A MONOPOLY OF KNOWLEDGE.

By "STRASBOURG."

There was a time, even within the memory of some of the more venerable of those who are now connected with the Aeroplane Industry, when that Industry, resembling in this respect, and perhaps this alone, the early Christians, had all things, including information, in common.

In those, apparently for ever, departed days even the Advisory Committee on Aeronautics condescended to publish to the world at large the results of their cogitations, and of such experimental work as was carried out by the N.P.L. and even by the Royal Aircraft Factory.

True these reports were published at a price, and that price beyond the means of any but the wealthiest members of the aeronautical fraternity; but as they were usually confined—where they were not entirely erroneous—to a restatement of facts perfectly well known to the experienced, this mattered little.

To-day the aviation community is scattered over the earth; its members no longer each know each by their respective nicknames; and the direct interchange of experiences takes place only to a limited degree.

CONFIDENTIAL INFORMATION.

For five years technical information has been doled out, under oaths of secrecy and under deadly penalties for the infringement of such oaths, by a collection of assorted trouser-polishers, mostly young, mainly learned, and all of them possessed of that worst of devils—*pace* the author of the "Ingoldsby Legends"—the best of intentions.

Had the mischief been confined solely to the distribution of information it had been sufficiently regrettable.

Unfortunately this circle of the elect has successfully prevented not only the circulation of information, but even the acquirement of knowledge by individuals of an experimental turn of mind.

Were one minded to attempt the construction of any brand of aircraft differing in its conception from those ideas which they held in favour, effective means were discovered to prevent such an effort.

Did a sacrilegious Hun produce a biplane which outclassed our own machines, the fact was carefully suppressed till those who had met such a machine, and by some happy chance escaped to tell the tale, had spread the news.

Then a careful official explanation of the reasons why this machine could not conceivably do those things it was known to do, supported by official tests on a battered and probably incorrectly rigged sample of an out-of-date machine of the same make, would be issued as a confidential memorandum not to be divulged to the world at large.

These things were so, and these things, eight months after the cessation of hostilities, still are so.

It is still an offence for a technical journal to publish information contained in any of the confidential technical reports which have been published, under one title or another, by any of those bodies which have been engaged in the cornering of aeronautical technical information during the war.

TECHNICAL OFFENCES.

It is still an offence for two aeroplane designers publicly to discuss the merits or demerits of any method of computation laid down by the official wisdom-mongers. It is still illegal to query, except privately and in the darker places of the earth, the pronouncements of those in office as to what is or is not a suitable material to be used for a given purpose.

It may be that such things were an essential corollary of war. If it be so, it is merely an index of how stupid an affair war is.

It may even be that it is necessary, in the interest of the military branches of aeronautics, that some very close control upon the designers and makers of military aircraft be continued.

If this be so, then is the R.A.F. foredoomed. It may —it probably will—become a rival to the Army for the favour of those of our youthful males who possess more money than brains.

It very probably will develop, in its technical branches, an asylum for such as, incapable of earning a living in the open market, are yet too conscientious merely to play with their alleged work, and who will live continuously subject to the contempt of their more thoroughly incompetent "brothers in arms," even as do the Sappers of the Army.

It is, of course, obvious to any mind which is both intelligent and informed that it is essential for the well-being of the world at large that military forces should be utterly inefficient.

Providential Foresight.

Providence must be credited with a foresight so sufficient that it has moulded the human mind in such wise that, once it be safely and securely entangled in any governmental mechanism, it becomes dull, self-opinionated and ineffective.

An army of 100,000 men of average European intelligence, directed with the efficiency of even an average British manufacturing concern, could in a year produce quite a noticeable and a permanent effect upon the appearance of the earth at large.

Several armies, of a total approaching 20,000,000 men, directed according to the time-honoured rules of war, have recently spent over four years in an attempt to destroy each other's portion of the earth.

They have slightly modified the state of a few hundred square miles, at a cost, both to themselves and to their neighbours, of very considerable hardships and inconvenience, but the verbiage which has resulted from their efforts is likely to survive any other effect.

So while it may be well that our Air Forces should be thus restrained in their progress, that the next war may not be conducted with any greater effectiveness than was the last, that the earth may not be utterly destroyed thereby, it yet remains far from well in so far as the same restraint is imposed upon the commercial development of aircraft.

It might be argued that it were better that the wars of the future be thus shorn of some of their terrors, even at the cost of industrial development.

In fact, equipment makes little difference to the effectiveness of an army or other military force.

Equip a fool army with the finest and most deadly of the weapons of precision, it remains a fool army, and will so remain whilst Governments are what they are, and the traditions of Government service continue to be based upon form and not upon effect.

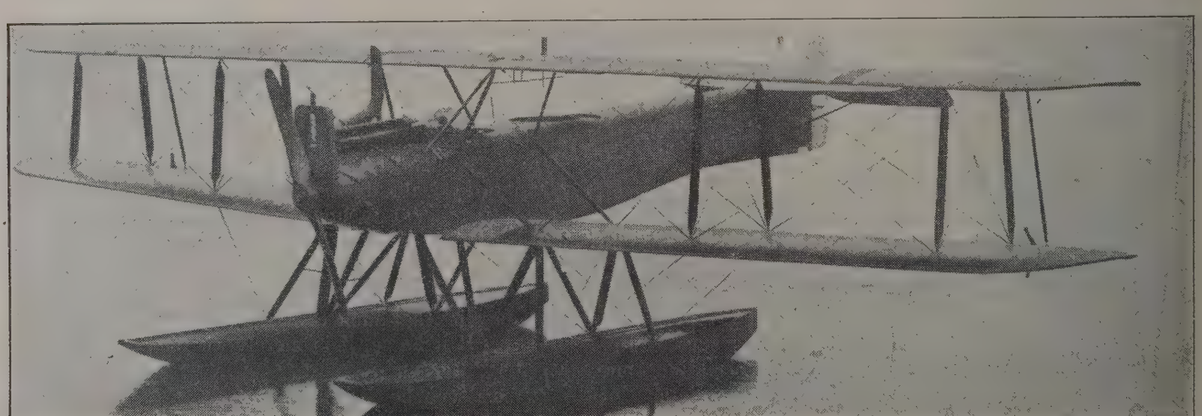
When mankind has sufficient sense to govern itself for its own profit, and not for the pleasure of its ears and eyes, it will have too much sense to waste its time destroying its own handiwork, and war can confidently be expected to cease, except, perhaps, as a spectacular pageant, fought according to very conventionalised rules and with very prehistoric weapons, and with a fair proportion of the gate-money as the victors' reward.

The use of aircraft would naturally be ruled out by the International War Federation in drawing up the regulations for such affairs, since their use would tend to rob the more serious and sanguinary part of the show of those elements of surprise and uncertainty which should be their most attractive feature.

Thus there is not really any real military danger involved in the rapid development of the technique of aeronautical engineering, and there is not the slightest excuse for the delay in publication, on the part of the Air Ministry, of the immense amount of data upon which they are now sitting.

Concealed Data.

It is generally alleged that this data has been placed at the disposal of all those who have any real use for it. This is by no means the fact. Designers have been refused permission to design, or to carry on experimental work, merely because their proposals did not commend themselves to the officials of the Technical Department, and have been refused even information as to why their proposals were scorned.



But even this is relatively unimportant. Most of the facts disclosed in confidential technical reports issued by the late Air Board and the present Air Ministry have been wrapped up and disguised in the opinions of the official technical experts, and to a large extent practice has been compelled along the lines of these opinions.

What is needed is the free and open discussion, in the Press and elsewhere, of the real meaning of the data which these reports contain, and of the results obtained by designers from experiments based on this data.

The Government of the United States of America have begun to issue reports of experimental work carried out under the control of the American Advisory Committee on Aeronautics.

These reports are excellently conceived. They are, so far as they have at present been examined, free from special pleading or personal interpretations. They record not merely the results of the experiments, but are extraordinarily frank as to the limits of accuracy of the methods employed in reaching them.

It may therefore be expected that within a very short space all enterprising aeronautical engineers will be able to look, not without relief, to some source of information which is not tainted with Boloism.

A single-engined Friedrichshafen Seaplane, of a type which proved itself extremely useful in the North Sea during 1917. It will be noticed that the tail and rudder are elevated in the Brandenburg manner, and that the floats, as is usual in German sea machines, are of the Howard Wright type.

MODERN BRITISH AEROPLANES.

X.—The Fairey Aviation Co., Ltd.

Three-quarter view from rear of the Fairey N.10 in her original form (Type III). 260 h.p. Sunbeam engine.

Mr. C. R. Fairey's connection with aeroplane development in England goes back to very early times.

He was associated with the Blair Atholl Aeroplane Syndicate, and took an active part in the development of the Dunne machines as practicable aeroplanes. He then joined Short Bros. at Eastchurch, and was intimately connected with the development of the Short Seaplanes, which rendered such good service with the R.N.A.S.

In 1915, Mr. Fairey founded the Fairey Aviation Co., Ltd., of which he is managing director.

Amongst a number of valuable contributions to the applied science of aeronautical engineering due to Mr. Fairey, probably the most valuable is the Fairey Variable Camber gear.

This consists of a flap similar in construction to the ordinary aileron, but extending over the whole span of the wing, and so arranged that it may be moved either up or down relatively to the fixed part of the wing, on both sides at once, quite independently of the ordinary use of the whole flap, or a part thereof, as an aileron.

This has the effect of providing a variable camber and makes it possible to use an aerofoil section with a low maximum lift and a high lift to drag ratio, heavily loaded, and giving a high speed, and of converting this aerofoil whilst in flight into a heavily cambered high-lift section which will give a low landing speed.

THE FAIREY TWIN-ENGINED FIGHTER.

This machine was completed and flown during 1915. It was designed for fighting purposes in the days before the advent of the synchronised gun, and at a time when the single engine tractor type was generally considered useless for offensive purposes.

In spite of its excellent performance and its superiority to any other type then available, it was lost amongst the shifting sands of our aerial policy, and was never reproduced.

SPECIFICATION.

Type of machine	Biplane
Name or type number of machine	F.2
Span (upper plane overall)	77 ft.
Gap (maximum and minimum)	6 ft.
Overall length	40 ft. 6½ in.
Maximum height	13 ft. 5⅝ in.
Chord	5 ft. 6 in.
Total surface of wings	718.4 sq. ft.
Span of tail	17 ft. 6 in.
Total area of tail (including elevators)	103.9 sq. ft.
Area of elevators	39 sq. ft.
Area of rudder (2 rudders)	10 sq. ft. each—20 sq. ft.
Area of fins (10.9 each)	21.8 sq. ft.
Area of ailerons	47.8 sq. ft. each—95.6 sq. ft. total
Maximum cross-section of body	3 ft. by 2 ft. 6 in.
Horizontal area of body	97 sq. ft.
Vertical area of body	75 sq. ft.
Engine type and h.p. (2 engines)	190 h.p. Rolls-Royce
Weight of machine loaded	4680 lbs.
Load per square foot	6.8 lbs.
Weight per h.p.	13 lbs.
Tank capacity in hours	3½ hours
PERFORMANCE—	
Speed low down	81 knots
Climb—	
To 5,000 ft.	6 mins.

The Fairey N.10 in her second form (Type IIIA) with land undercarriage for deck flying.

THE HAMBLE BABY.

This machine was the result of an effort to provide a light fast seaplane fitted with a standard rotary engine, which should combine a low landing speed, a fair top speed, and the capacity to climb to a reasonable height loaded with two 65 lb. bombs.

The first of the type was manufactured by fitting a "Sopwith Baby Seaplane" fuselage and chassis with a new set of wings equipped with the variable camber device, to which reference has already been made, and an enlarged tail, rudder, fin, and tail float.

The result was so successful that a large number of the type was ordered.

SPECIFICATION.

Type of machine	Seaplane
Name and type No.	F.129 Hamble "Baby"
Span overall	27 ft. 9½ in.
Gap	4 ft. 6 in.
Length overall	23 ft. 4 in.
Maximum height	9 ft. 6 in.
Chord	4 ft. 9 in.
Total surface	246 sq. ft.
Span of tail	10 ft. 9 in.
Total area of tail (including elevators)	41 sq. ft.
Area of elevators	17 sq. ft.
Area of fin	4.3 sq. ft.
Area of ailerons	9.1 sq. ft. each—36.4 sq. ft. total
Maximum cross-section of body	3 ft 2 in. by 2ft 7 in.
Horizontal area of body	39.4 sq. ft.
Vertical area of body	34 sq. ft.
Engine type and h.p.	Clerget 110-h.p.
Weight loaded	1,900 lbs.
Load sq. ft.	7.8 lbs.
Weight per h.p.	17.21 lbs.
Tank capacity in hours	3½ hours
PERFORMANCE—	
Speed low down	85 knots
Climb—	
To 5,000 ft.	8 mins.

THE FAIREY "CAMPANIAS," F.16, F.17, AND F.22.

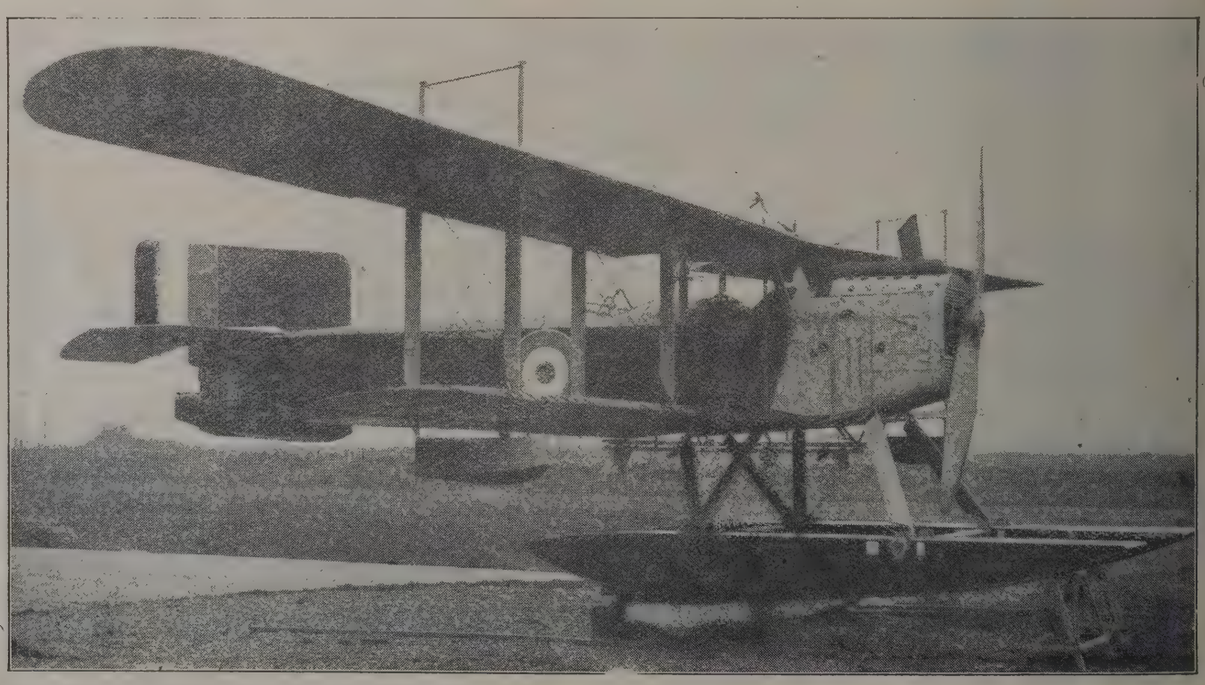
These three machines are all very similar—they are, in fact, modifications of the same design.

The "Campania" design was limited in its overall dimensions to suit the hatchways and stowage accommodation of the seaplane-carrier "Campania." The specification called for a combination of high top speed, low landing, and getting off speeds, together with the greatest possible fuel and bomb capacity.

The original F.16 was designed with a fairly high lift wing section, fitted with the Fairey flap gear, and was equipped with an early Rolls-Royce "Eagle," giving 250-h.p.

On test it was found not to come up to the designer's expectation. The high lift wing with the flaps upturned were not efficient, and the high speed reached was disappointing.

F.17 was accordingly built. This machine differed mainly in having wings of a standard high-speed type, fitted with flaps to secure a low landing speed. The tail was somewhat modified, a larger fin and a smaller rudder were fitted and an Eagle engine of a later series and greater power was installed. The results were excellent.



It was then decided that 375 h.p. Rolls-Royces could not be spared for mere seaplanes, and the machine was modified to take the 260-h.p. Sunbeam engine. In this form it was known as the F.22, and was produced in fair numbers.

SPECIFICATION.—F.16.

Type of machine	Seaplane
Name or type No.	F.16 Campania
Span overall	61 ft. 7½ in.
Gap	6 ft. 6 in.
Length overall	43 ft. 3⅝ in.
Maximum height	15 ft. 1 in.
Chord	6 ft. 4 in.
Total surface of wings	639.8 sq. ft.
Span of tail	13 ft.
Area of tail, including elevators	75.1 sq. ft.
Area of elevators	28.1 sq. ft.
Area of rudder	28 sq. ft.
Area of fin	14 sq. ft.
Area of ailerons	23.4 sq. ft. each—46.8 sq. ft total
Maximum cross-section of body	3 ft. 6 in. by 3 ft. 1 in.
Horizontal area of body	90 sq. ft.
Vertical area of body	88 sq. ft.
Engine type and h.p.	250-h.p. Rolls-Royce
Weight fully loaded	5,500 lbs.
Disposable load	1,026 lbs.
Load per square foot	8.6 lbs.
Weight per h.p.	22.2 lbs.
Tank capacity	88 galls.
PERFORMANCE—	
Speed low down	72 knots
Landing speed	42 knots
Climb—	
To 5,000 ft.	14 mins.

SPECIFICATION.—F.17.

Type of machine	Seaplane
Name or type No.	F.17 Campania
Span overall	61 ft. 7½ in.
Gap	6 ft. 6 in.
Length overall	43 ft 3⅝ in.
Maximum height	15 ft. 1 in.
Chord	6 ft. 4 in.
Total wing surface	627.8 sq. ft.
Span of tail	13 ft.
Area of tail (including elevators)	75.1 sq. ft.
Area of elevators	28.1 sq. ft.
Area of rudder	19.6 sq. ft.

The Fairey Type IIIB Seaplane (260 h.p. Sunbeam engine).

Area of fin ..... 16.2 sq. ft.
Area of ailerons ..... 23.4 sq. ft. each—46.8 sq. ft. total
Maximum cross-section of body ..... 3 ft. 6 in. by 3 ft. 1 in.
Horizontal area of body ..... 90 sq. ft.
Vertical area of body ..... 88 sq. ft.
Engine type and h.p. ..... 275-h.p. Rolls-Royce
Weight fully loaded ..... 5,560 lbs.
Disposable load ..... 1,100 lbs.
Load per sq. ft. ..... 8.7 lbs.
Weight per h.p. ..... 19.5 lbs.
Tank capacity ..... 88 galls.

Performance—
Speed low down ..... 78 knots
Landing speed ..... 43 knots
Climb—
To 5,000 ft. ..... 12 min. 30 sec.

SPECIFICATION.—TYPE F.22.

Type of machine ..... Seaplane
Name or type No. ..... F.22 Campania
Span overall ..... 61 ft. 7½ in.
Gap ..... 6 ft. 6 in.
Length overall ..... 43 ft. 0⅝ in.
Maximum height ..... 15 ft. 1 in.
Chord ..... 6 ft. 4 in.

Weight of machine loaded ..... 5,329 lbs.
Disposable load ..... 1,086 lbs.
Load per sq. ft. ..... 8.14 lbs.
Load per h.p. ..... 20.1 lbs.
Tank capacity ..... 88 galls.

Performance—
Speed low down ..... 74 knots
Landing speed ..... 40 knots
Climb—
To 5,000 ft. ..... 18 min.

THE FAIREY N.9.

This machine was designed for reconnaissance work at sea, and was not intended to carry a large bomb load. In its general lines it resembled the "Campania" type, but had cut-down lower planes and was powered with a 190-h.p. Falcon Rolls-Royce.

Like the "Campanias" it was fitted with variable camber gear.

Only one machine of the type was built, largely on account of the shortage of Rolls-Royce engines, and the solitary example was used for experimental work.

An interesting feature of this machine's history is the fact that it was the first British seaplane to begin a flight by being thrown off the deck of a ship by a catapult gear.

SPECIFICATION.

Type of machine ..... Seaplane
Name or type number of machine F.127
Purposes for which intended ..... Shipwork
Span ..... 50 ft.
Gap (maximum and minimum) ..... 5 ft. 7 in.
Overall length ..... 35 ft. 6 in.
Maximum height ..... 13 ft.
Chord ..... 5 ft. 6 in.
Total surface of wings ..... 420 sq. ft
Span of tail ..... 13 ft.
Total area of tail ..... 34.2 sq. ft.
Area of rudder and fin ..... 9 ft. 8 in.
Area of each aileron and total area ..... 18 sq. ft.
Engine type and h.p. ..... 190 h.p. R.R.
Load per square foot ..... 9.08 lbs.
Weight per h.p. ..... 18.15 lbs.
Tank capacity in hours 5¼
Tank capacity in gallons 70

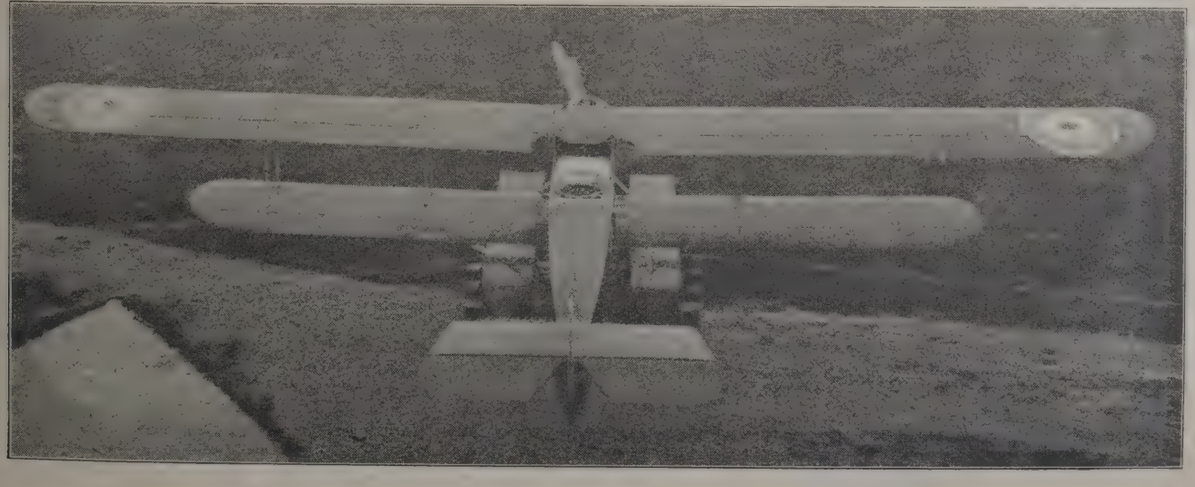
Performance—
Speed low down ..... 78 knots
Speed at 10,000 ft. ..... 74 knots
Landing speed ..... 38 knots
Climb—
To 5,000 ft. ..... 9 min. 30 sec.
To 10,000 ft. ..... 38 min.
Disposable load apart from fuel 516
Total weight of machine loaded ..... 3,812 lbs.

THE FAIREY TYPE III, IIIA, IIIB, AND IIIC.

The original Type III machine—known as N.10 in the R.N.A.S.—was mainly a modified N.9, with the lower wing extended to a span equal to that of the upper wing, and fitted with the 260-h.p. Sunbeam.

This machine underwent a number of metamorphoses. Fitted with a land chassis in place of floats, it became a "deck flier," or ship plane. This form became known as the Type III, and fitted with flotation air bags and hydrovanes for alighting on water was reproduced in some quantitiy.

After this the same fuselage was fitted with a set of wings of greater span, larger floats, and a heavier chassis, was equipped with bomb gear and became the prototype of the Type IIIB.



Later still, the "Eagle" Rolls-Royce engine in its 375-h.p. edition became available, and a kind of mixture of the N.10 varieties was produced, known as the Type IIIC.

This consists of the standard fuselage, fitted with the wings of the original Type III, and the chassis and floats of the Type IIIB, with enlarged fuel tanks and a greatly improved performance. The following specifications give the main details of these varieties of the N.10 type.

SPECIFICATION.—TYPE III.

Type of machine ..... Seaplane
Name or type number of machine F.128
Purpose for which intended ..... Sea scout
Span ..... 46 ft. 2 in.
Gap (maximum and minimum) ..... 5 ft. 7 in.
Overall length ..... 36 ft.
Maximum height ..... 13 ft.
Chord ..... 5 ft. 6 in
Total surface of wings ..... 476 sq. ft.
Span of tail ..... 13 ft.
Total area of tail ..... 34.2 sq. ft.
Area of rudder and fin ..... 9.8 sq. ft.
Area of each aileron ..... 16.5 sq. ft.
Engine type and h.p. ..... 260-h.p. Sunbeam
Load per sq. foot ..... 8.74 lbs.
Weight per h.p. ..... 15.69 lbs.
Tank capacity in hours ..... 4½ hours
Tank capacity in gallons ..... 76 galls.

Performance—
Speed low down ..... 90 knots

Rear View of the Fairey Type IIIB Seaplane with 260 h.p. Sunbeam engine.

Speed at 10,000 ft.	82 knots
Landing speed	41 knots
Climb—	
To 5,000 ft.	9.15 min.
To 10,000 ft.	23 min.
Disposable load apart from fuel	584 lbs.
Total weight of machine loaded	4,160 lbs.

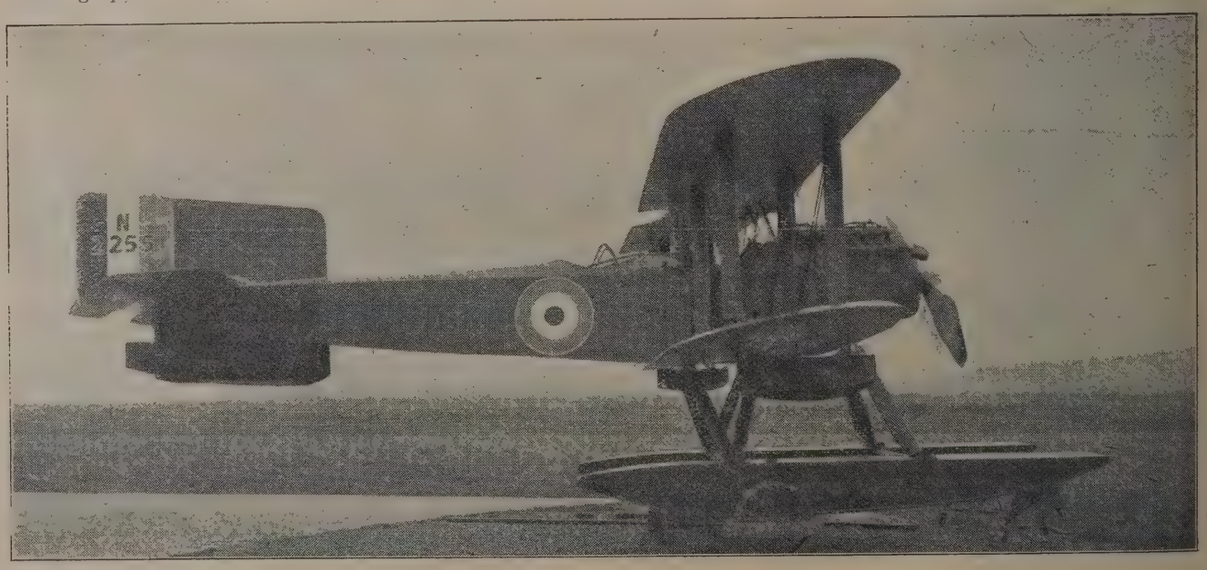
Total weight of machine loaded	5,050 lbs.

THE N.4 TYPE FLYING-BOAT.

This machine, designed by Mr. Fairey, in collaboration—so far as hull was concerned—with Major Linton Hope—was intended for work with the Fleet at sea.

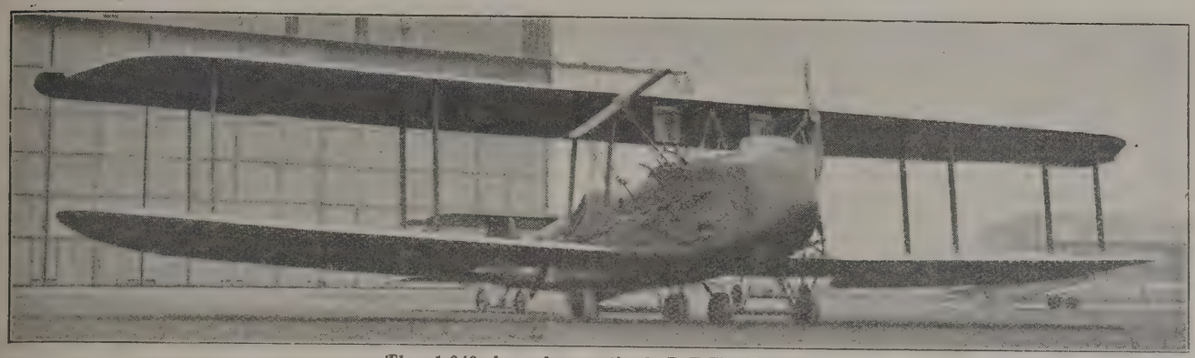
The main requirements were great air endurance, seaworthiness, a formidable armament, and a high performance



The machine is being built in two varieties known as the "Atalanta" and the "Titania." The first type has fixed section wings, whereas the "Titania" is to be fitted with the Fairey variable camber gear.

This type of machine is too interesting and presents too many novel features for justice to be done to it in this article.

A general specification is attached, but it is hoped that it will shortly be possible to describe it in detail, and further particulars and illustrations will then be given.



SPECIFICATION.

Type of machine	Flying-boat
Name and type number	N.4 "Atalanta" or "Titania"
Span	139 ft. top, 93 ft. bottom
Gap	14 ft. centre, 12 ft. at tip
Length overall	66 ft.
Maximum height	29 ft. 6 in.
Chord	12 ft. 6 in.
Total surface of wings	2,900 sq. ft.
Span of tail	25 ft.
Area of tail, including elevators	350 sq. ft.
Area of elevators	50 sq. ft.
Area of rudders	50 sq. ft.
Area of fins	50 sq. ft.
Area of ailerons	83 sq. ft.
Engines	4 Rolls-Royce "Condor" 600-h.p.
Total weight loaded	30,500 lbs.
Load per sq. foot	10.5 lbs.
Load per h.p.	12.7 lbs.
Tank capacity	1,000 galls—12 hours

Side View of the Fairey Type IIIC Seaplane (375 h.p. "Eagle" Rolls-Royce engine).

THE D.F.W. FOUR-ENGINED BIPLANE.

The 1,040 h.p. four-engined D.F.W. Biplane.

The D.F.W. machine hereafter described is of a type which, as yet, is exclusively German, so far as practical construction is concerned. It is of the multiple-engined type, with all the engines within the fuselage and with airscrews on the wings, shaft-driven from the engines.

The first D.F.W. of this type was begun in September, 1915.

Four 220-h.p. Mercédès engines were carried within the fuselage, two engines, one above another on each side, with a central gangway between.

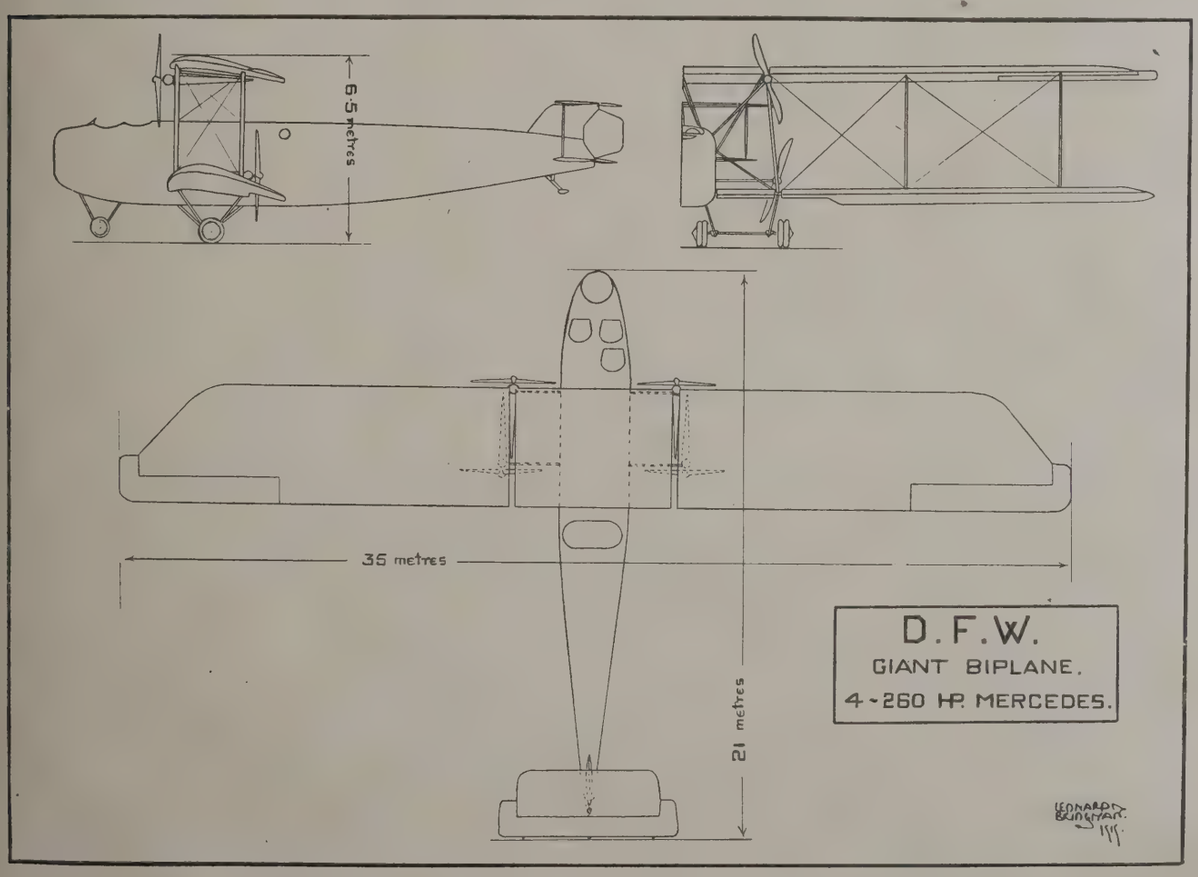
Each engine drove through bevel gears and shafts a single airscrew. These airscrews were arranged in the manner shown in the scale drawing—one pair of tractor airscrews mounted high in the interplane gap on each side and one pair of "pusher" airscrews low down and (in front elevation) immediately below the tractors.

Thus the disadvantages of the tandem arrangement of airscrews are avoided.

Preliminary trial flights were made successfully, and the machine was subjected to military acceptance on Oct 19th, 1916, at Döberitz.

Weighing empty 6,800 kgm., with a total lead of 2,600 kgm., and a total loaded weight of 9,400 kg. (9.4 tons), the machine showed a maximum speed of 130 k.m.h. (81 m p.h.), and climbed 1,000 metres in 10 mins., 2,000 metres in 25 mins., and 3,300 metres (10,900 ft.) in 53 mins.—this being the apparent ceiling.

During further trials at Döberitz a number of crankshaft failures occurred, which were attributed to the excessive length of the 8-cylinder 220-h.p. Mercédès engine. Extra strong engine bearers were provided, and the transmission shafts were fitted with universal joints, and the trouble was thus overcome.



After tests the machine was sent to the Eastern front, where it arrived on April 30th, 1917.

It was found to possess good manœuvring and climbing capacity, and six enlarged editions were ordered.

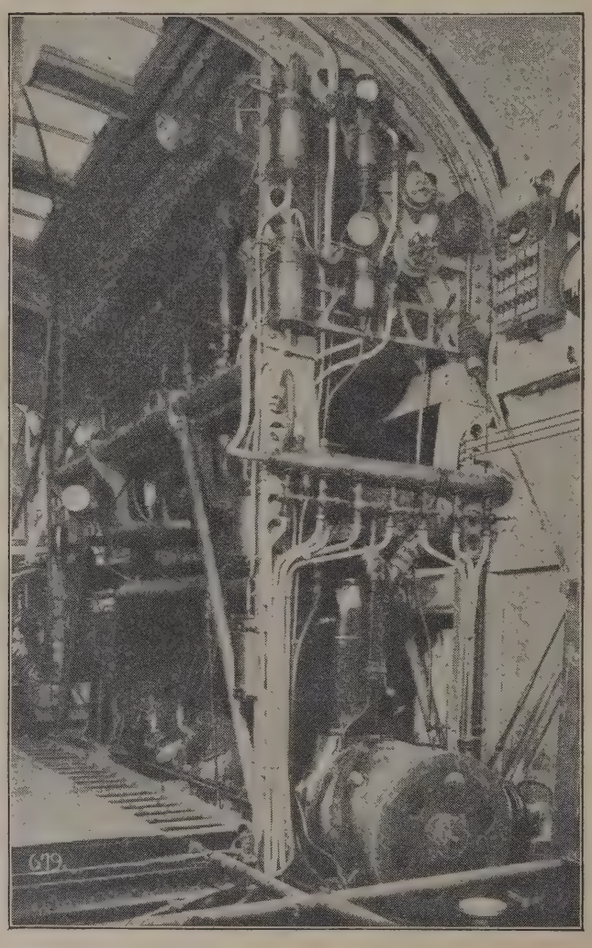
These were to be equipped with the 260-h.p. six-cylinder Mercédès, and to carry a load of 3,400 kgm. instead of 2,600, as in the original.

The first machine of the enlarged type was begun early in 1918, and preliminary test flights were made in August.

Considerable trouble was experienced with the transmission. The shafts from engine to airscrew shaft were geared up to 3,000 r.p.m. and vibrated excessively. These shafts were, therefore, encased in stiff tubes and, presumably, supported therein on ball races, with satisfactory results.

In April, 1919, the machine was sent to Cologne, and there carried out numerous tests.

The general arrangement of the power plant is similar to that of the original type. The transmission systems embody reduction gears which bring each airscrew down to 900 r.p.m.



A photograph is reproduced which gives a good idea of the engine installation.

The general arrangement of the whole machine is well shown in the drawings reproduced.

The general dimensions and particulars are given in the appended specification :—

SPECIFICATION.

Span	35 m.
Length overall	21 m.
Height overall	6.5 m.
Total surface	260 sq. m.
Weight empty	8,600 kg.
Weight of fuel and oil	1,440 kg.
Instruments and lighting set	130 kg.
Crew (6)	470 kg.
Disposable load	1,700 kg.
Total loaded weight	12,340 kg.
Weight per h.p.	12 kg.
Weight per sq. metre	47 kg.
Max. speed	132 km. p.h. (84 m.p.h.)

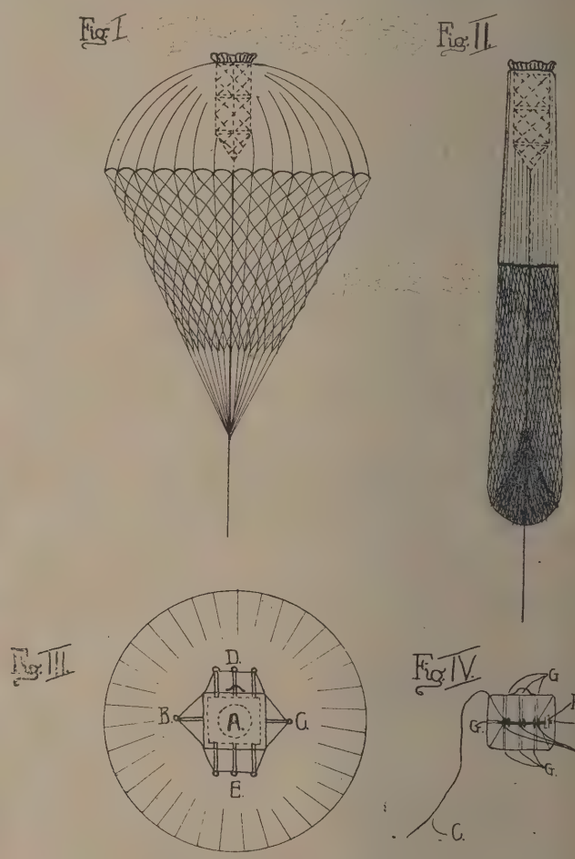
View in the engine-room of the D.F.W. Giant showing the starboard pair of 260 h.p. Mercédès engines, one above the other.

A NEW CATALOGUE.

Fredk. Sage and Co., Ltd., of Gray's Inn Road, W.C., and of Peterborough, have just issued an illustrated brochure entitled "Sage Aircraft."

This gives a description of the work which the firm carried out in the construction of aircraft during the war, together with outline drawings and specifications of a number of machines designed to suit post-war conditions.

The production is excellently got up and splendidly illustrated.



A NEW FORM OF PARACHUTE.

The following letter has been received :—

Sir,—As a Parachute enthusiast I was very interested in the notes on parachutes by Lieut.-Col. H. S. Holt in your issue of April 9th, which is very interesting and instructive.

I may state while on active service in France last June, 1918, on Lewis gun work, I invented a parachute for aeroplanes which I claim to open almost instantaneously when exposed to air pressure.

The parachute has an airshaft consisting of hoops and netting which helps to open it, and the usual lines are netted over or simply replaced by netting, thus preventing any entanglement—this addition of about four pounds is well worth the extra weight to insure instantaneous opening, and to avoiding entanglements.

The parachute can be folded up or rolled up anyhow and is carried in a wrapper which is quite secure, but at the same time easy and quick to open. This wrapper consists of a piece of material stitched on top of the parachute in the shape of a rectangle, leaving a loose piece of flap on all four sides. Fig. 3 gives a top view of the parachute, showing A the wrapper, B, C, D and E the flaps. The two smaller flaps B, C have a ring at the ends, the two larger, D and E, several rings, through which a pin is passed to hold the bulk together when folded up. Elastic bands are stretched from the rings to the stretched-on parts of the wrapper so that the flaps contract as soon as the pin is drawn from the rings, thus exposing the parachute to the air pressure.

Fig. 4 shows F, the rings G, the elastic bands, and H, the pin. The wrapper need not be stitched on the parachute.

I have made several models which I have tried and they work well. I cannot find any fault with the design and all aviators to whom I have shown it—both French and British—agree with me that we ought to have parachutes on aeroplanes in case of fire or some other unforeseen breakage where the aviator has not a ghost of a chance to see the aeroplane safely to earth.

J. F. Matey, R.A.

AEROPLANES FOR SALE.

A sale is announced, by direction of the Disposal Board of the Aircraft Disposal Department, of a limited number of new Handley Page aeroplanes, fitted with Rolls-Royce engines complete, and also two second-hand (practically new) Handley Page machines.

They can be seen at Cranwell Aerodrome, Sleaford, Lincs. Further particulars and permits to view can be obtained from the Controller of the above Department at Kingsway, W.C.2.

PATENTS INDEX

The subjoined list of recent inventions has been specially compiled by THE AEROPLANE from the Current Official Patents Records :—

PATENTS APPLICATIONS.

COMPLETE SPECIFICATIONS ACCEPTED, PRINTS OF WHICH CAN BE OBTAINED ON AND AFTER JUNE 26TH, 1919.

127,289. Nov. 6th, 1916. Weiss, P., and Verdier, J. Process for the production of intense artificial clouds, fogs, or mists.

127,299. April 5th, 1917. Smith, G. P. Bragg-., Desbleds, L. B., and Aeronautical Institute of Great Britain. Girder structures particularly applicable to the construction of aircraft.

127,300. April 10th, 1917. Ellor, J. E., and Fowler, Sir H. Aero-engines.

127,307. April 10th, 1917. Vickers, Ltd., Pierson, R. K., and Duncan, T. S. Tail skid or runners of aeroplanes.

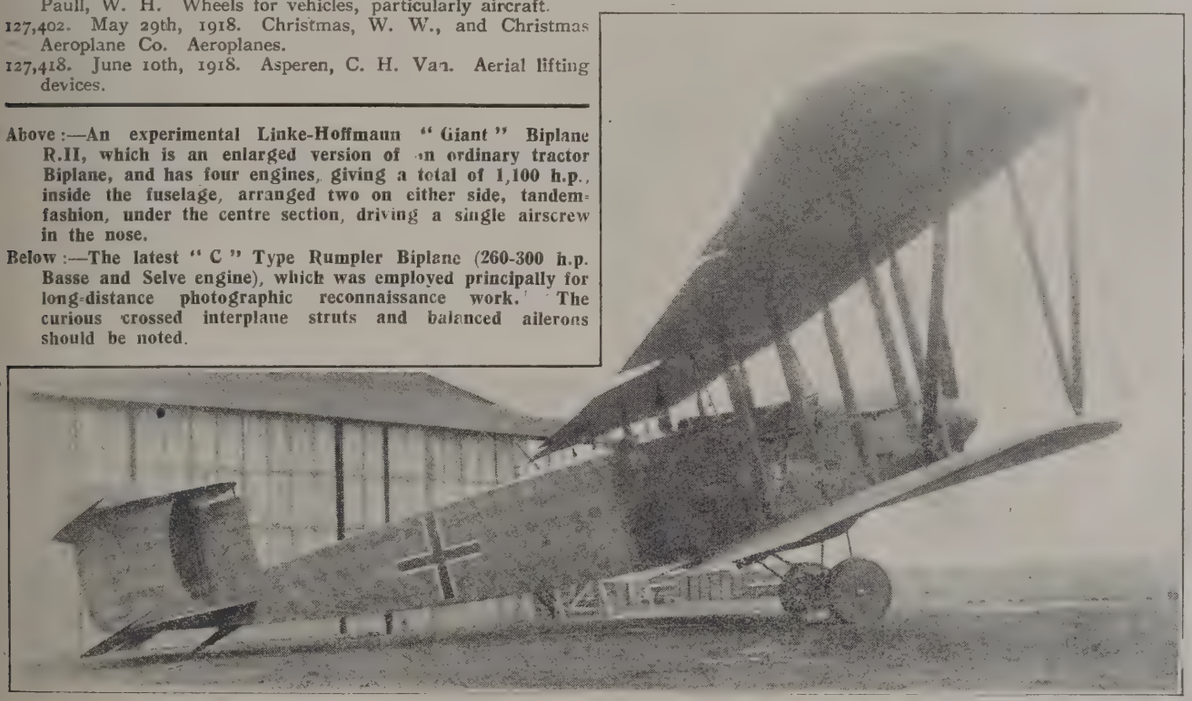
127,311. April 13th, 1917. Dudd, H. B. Means for applying tape and the like to the wings of aeroplanes, and for like purposes.

127,320. April 19th, 1917. Fowler, Sir H., and Salmon, P. Internal combustion engines for aircraft.

127,327. April 20th, 1917. Ricardo, H. R. Driving mechanism for propeller.

127,332. April 23rd, 1917. Antoine, T. Pedal control for aeroplanes, motor-cars, and the like.

127,337. April 25th, 1917. Gledhill, A. H. Apparatus for releasing bodies from aircraft.



127,373. May 1st, 1918. Dunlop Rubber Co., Macbeth, C., and Paull, W. H. Wheels for vehicles, particularly aircraft.

127,402. May 29th, 1918. Christmas, W. W., and Christmas Aeroplane Co. Aeroplanes.

127,418. June 10th, 1918. Asperen, C. H. Van. Aerial lifting devices.

Above :—An experimental Linke-Hoffmann "Giant" Biplane R.II, which is an enlarged version of an ordinary tractor Biplane, and has four engines, giving a total of 1,100 h.p., inside the fuselage, arranged two on either side, tandem-fashion, under the centre section, driving a single airscrew in the nose.

Below :—The latest "C" Type Rumpler Biplane (260-300 h.p. Basse and Selve engine), which was employed principally for long-distance photographic reconnaissance work. The curious crossed interplane struts and balanced ailerons should be noted.

THE MAINTENANCE OF CAR LIGHTING SETS.

Of the readers of this journal, certainly a fair number, and, probably, the great majority, are to some extent interested in motoring.

To all these the handbook of running instructions for the C.A.V. Dynamo lighting and starting system, which has just been issued by Messrs. C. A. Vandervell and Co., Ltd., Acton, should be of interest.

It contains clear and easily understood instructions for the use, care, maintenance, and adjustment of this particular lighting set, with a particularly full treatment of the care of batteries.

AVIATION INSURANCE.

Anyone wishing to benefit their relations—a strange wish, as relations are always the last people to whom one desires to leave money—could do this with the minimum of trouble by insuring his life for £5,000 by paying 25s. and then proceeding to have a joy (?) flip in a dud aeroplane, and a crash from a good height.

Muir, Beddall and Co., Ltd., of 4, Bucklersbury, E.C.4., have an aviation department which undertakes to insure a man against death for £500 on payment of 5s. for any trip whatsoever in the United Kingdom, no matter how many machines are flown in upon the journey. The limit to this is £5,000 for a corresponding multiple of premium.

Only 2s. 6d. per £500 insurance is required for joy flights, from which it is easy to calculate as above, £5,000 for 25s.; and the only thing required of one is to get well crashed.

"STEELS that Stand the Strain"—(2)

Tested by the A.I.D., tried out by the leading aeroplane makers; high tensile strength; high impact test; soundness and reliability — these are the characteristics of

Edgar Allen's Nickel Chrome Steel

COMMERCIAL AERONAUTICS & CIVIL AERIAL TRANSPORT

ON MINDING ONE'S OWN BUSINESS.

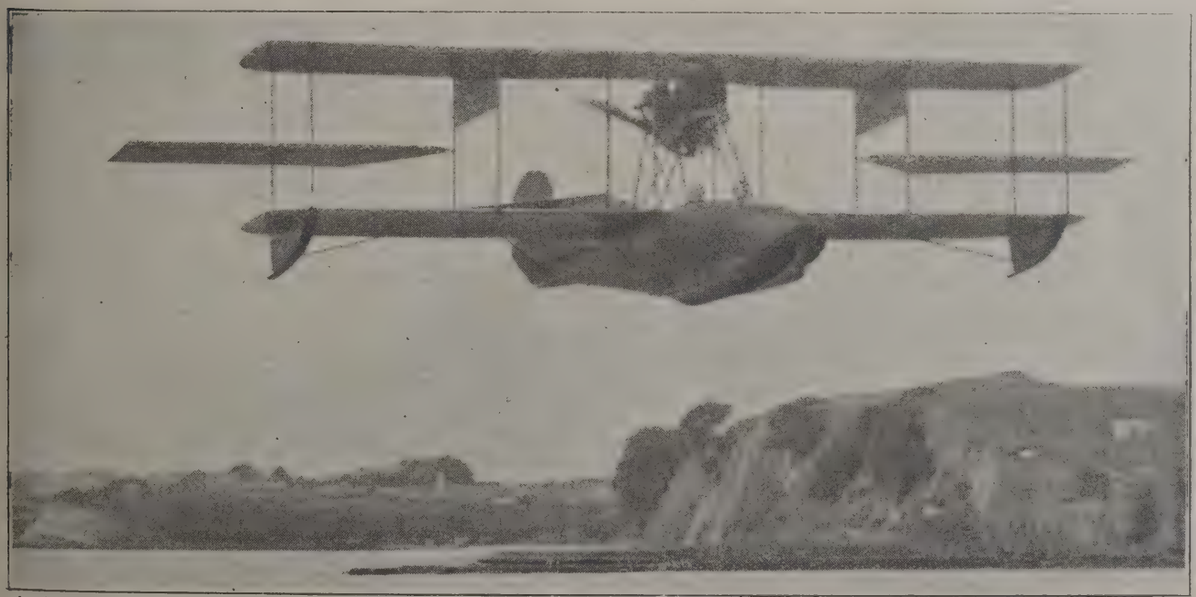
By "MEDWAY."

Last week, when trying to begin a discussion on the development of commercial aerial services—particularly overseas—I arrived at the preliminary conclusion that the British Aircraft Industry, taken as a whole, does not itself show enough confidence in this admirable proposition. Possibly this lack of confidence is more apparent than real, and it occurs to me that it may be due, in part at least, to the fact that manufacturers are being constantly pressed to go beyond their natural jobs and to become promoters of aerial haulage-contracting and passenger-conveying companies.

Let us try to consider where the legitimate business of the manufacturer begins and ends, before starting to abuse him for not interfering in what are, in reality, other people's affairs.

First, he must manufacture. Secondly, he must sell his product. Thirdly, he must endeavour to ensure that the product, when sold, gives good service and produces satisfactory financial results. Unless he attends to this third consideration, his business can only be a very temporary one.

I shall not attempt to advise him on his first job. The British Industry certainly knows how to manufacture. The next question is whether it knows equally well how to sell. Its experience in that direction is very much more limited. Many firms possess none at all, because negotiation of Government contracts does not amount to the same thing as selling, in the ordinary sense of the term.



The Art of Salesmanship.

You cannot sell an aeroplane as you would a packet of pins. It is a new proposition, fairly expensive and distinctly speculative. Therefore, sales depend on effective propaganda and demonstration. The latter, I think, must in general precede the former, because commercial propaganda must be based on sound figures, and these can best be compiled as the result of properly organised demonstration.

Demonstrations may be either individual or collective. If the manufacturer is determined to play a lone hand, probably his best plan is to establish a number of small but properly equipped services in various promising parts of the world. It is likely enough that such services will show an initial loss. Later they may pay, and be sold as going concerns to operating companies which would have a natural leaning towards building up their increased fleets by the purchase of further machines of the same make, so simplifying the maintenance and spare-parts problems. Loss in the first instance must, however, be faced, and must be written off as advertisement expenditure.

In connection with these demonstration services, very carefully audited accounts must be kept, each service being treated as a separate company, to which the main concern sells at a commercial price. In this way there would be created valuable data as to actual costs of operation under various conditions.

Also, a good publicity staff must be provided in connection with each demonstration service. The costs of this will be charged partly to the service and partly to the parent concern. The publicity department will have two jobs to do. One is the ordinary advertising necessary to secure patronage for any haulage or carrying business. This must be debited to the service. The other is the provision and transmission of matter and photographs to the parent body. These would form the basis of very valuable free publicity, being obviously acceptable to the Press in almost any part of the world.

A FIELD FOR COMMERCIAL AERONAUTICS.—One of the Walsh Brothers' Flying-boats (of an early Curtiss type) flying along the coast of New Zealand, near Auckland.

What fine illustrated articles could, for instance, be based on such stuff referring, let us say, to a flying-boat service on a big river in China or South America!

Into the Enemy's Camp.

The manufacturer may object that what I am advising is contrary to the title at the head of this note. It is no business of his to run operating concerns, but rather to sell them. This last is freely admitted. Personally, I think it is bad policy of any manufacturer to go into competition with the potential buyers of his goods. It serves to drive them into the enemy's camp. That is why I mentioned that, when established, the services would be disposed of as going concerns. Given satisfactory proved figures of cost and takings, there would be no great difficulty about this, and from that point the manufacturer would step gracefully into the background and merely continue to sell stuff to the purchaser of the services. He would endeavour to get to this stage as soon as a natural demand for his products had been stimulated.

At the risk of vain repetition I repeat that what he is doing at first is no more than necessary demonstration, coupled with equally necessary collection of data for purposes of propaganda.

The present position is one that has to be faced and passed by every industry, the products of which must justify themselves by economic performance after sale. The commercial motor industry has gone through it and emerged successfully. The aircraft industry can do the same. It needs, however, to apply somewhat heroic measures, because circumstances have given it an output out of all proportion to the developed demand.

Up to the present I have referred only to individual demonstrations. I propose to deal with collective demonstrations and the proper use of propagandist material in subsequent articles.

INFANTICIDAL OFFICIALS.

By IL PENSEROSO.

It is a biological fact that, as regards the formation of the skull and brain, there is less difference between the higher classes of ape and man than there is between the higher and lower types of ape. This appears to offer a possible explanation for the conduct of those beings in the Department of Civil Aviation who are at present engaged in carefully ruining the prospects of commercial aeronautics in this country. They appear absurdly like men in the architectural design of the head; but the entire absence of reasoning power would seem to indicate that they belong to a lower species. And yet, on the other hand, there are two considerations which point directly against this conclusion.

The Instinct of Self-Preservation.

The first is that if the axiom "to err is human" be accepted as a scientific law, then the officials of the Civil Aviation Department can clearly claim to be, not merely human, but super-human. The second consideration deals with that characteristic which is found far more highly developed in man than in any animal, insect, reptile or fish. That quality is self-preservation.

When we examine communities of ants, bees and certain animals, we find that although their internal economy and individual habits are in many ways superior, though different in kind, to those of mankind, in man the instinct towards self-preservation is stronger because it is conscious.

In primitive types of man the instinct is individualistic; it is only in much later stages that it is realised that the good of the tribe or community is synonymous with the good and self-preservation of the individual. In the officials referred to the preservation-instinct is very strongly marked, and conscious.

In placing a mass of red tape, inane regulations and unnecessary obstacles in the way of commercial aviation, they are evidently acting on the assumption that if there were no regulations there would be no need for officials, and they themselves would be swept into the ranks of the unemployed or the Salvation Army. We can see, therefore, that this self-preservation instinct is clearly of the primitive type, for it does not see that the prosperity of British commercial aviation means the growth of the Civil Aviation Department.

After duly considering these arguments for and against the man theory, the question as to the species to which these officials belong is problematical. The best way to get a ruling on the matter would be to follow the example (reported by Professor Westermarck) on an Australian savage tribe which could not decide whether women were human beings or not. A kind of general election was held among the men, and the representatives solemnly debated the question. After much cerebration and excitement, it was put to the vote and settled by a narrow majority that women were human beings.

Aerial Legislation.

But, after all, it is perhaps not the foolish officials themselves that matter so much as the policy behind them. Before we see how that policy has arisen, let us note how it works in every-day business. It is essentially a system of bureaucratic administration, which is, of course, quite a different thing from bureaucratic legislation, though an equally poisonous growth. Nearly all modern laws are extremely loosely-phrased documents: someone truly remarked that there was never a statute you could not drive a coach and four through. It is the interpretation of the law that really matters. And therein lies the power and danger of bureaucratic administration.

Take the question, for example, of aerodromes. The law lays down that all aerodromes for passenger-carrying must be licensed; but it does not state the conditions under which licenses will be granted. There at once you have the aperture for the coach and four to drive through.

The administration decides under what circumstances they shall be licensed; and with a sensual delight in its own power the Department of Civil Aviation refuses to licence an aerodrome under 200 yards square. That is to say, it virtually decrees that every aerodrome shall be large enough to land every aeroplane, from a fast scout landing at 80 or 90 m.p.h. to a shorthorn pancaking down backwards at minus 3 miles per epoch.

The idea of not licensing aerodromes for certain types of aircraft is about as sensible as it would be for the Admiralty to prohibit cutters from putting in at Broadstairs jetty on the ground that a liner would feel uncomfortable there.

This absurd restriction knocks joy-ride tours on the head completely, owing to the impossibility of finding such comparatively large tracts of flat open ground accessible to large towns. Incidentally, these tours would be easily the best way of fostering aviation in this country amongst the general public, besides being the most paying proposition of their kind at present.

If there are a thousand potential joy-riders in a town, the only way to make a profit out of them is by taking them all up within a definite space of time—say, a week (with six machines). The only way to get them within the week is by restricting their opportunity for a flight to a week. The time factor is enormously important in commerce as well as in war. This is the principle on which the whole of the theatrical business in the provinces is run.

The Department cannot or will not see it. It is infinitely superior to joy-riding or exhibition riding. It cannot see that cross-country passenger and regular transport services will develop from joy-riding; that only after having been reassured of the safety of flying through the personal experience of a joy-ride will John Citizen be induced to travel by air.

Engineers' Licences.

Consider, again, the question of ground engineers' licences. The Directions issued with the Air Navigation Regulations say (IV—5) a candidate may apply for a licence to overhaul and inspect *all* flying machines, or for a licence limited to the inspection of any named type. A candidate can certainly apply for a general licence—for that matter anyone can apply for anything anywhere—but he will find that the silly people don't know their own silly rules.

An applicant known to the writer was informed by the examiners that they had never heard of licences for all types. So that if a man has had five years' experience on Avros, Pups, Camels, 1½ Strutters, Handley Pages, and Farmans, he will not be licensed to inspect a D.H.10; whereas if he has had a couple of years on D.H.4's, 6's, and 9's, he would probably get a licence to inspect "D.H. machines," and would therefore inspect D.H.10's. Which, as Euclid remarked, is absurd.

But, then, the whole examination is a farce. A.I.D. officers of whom nothing is known ask ambiguous questions concerning matters of which they appear to know nothing. Chief and assistant engineers and works managers of firms which have been making aeroplanes and engines for years have been turned down in an arbitrary and autocratic manner as "not being competent"; R.A.F. officers who have been inspecting aircraft for years in squadrons or repair sections or parks have been turned down for "not being competent." They may quite possibly be incompetent; but so may the examiners. And the examinations ought to be

Coatcids.

A Great Sheffield Discovery.

FIRTH'S STAINLESS STEEL was discovered in the Firm's Laboratories shortly before the War. It is undoubtedly one of the most important and far-reaching discoveries of this century.

FIRTH'S STAINLESS STEEL was immediately adopted for high-class table cutlery. These knives are now well known, and their labour-saving advantages, due to the fact that they do not rust, stain nor tarnish, render them indispensable in every modern home.

During the War, the output of **FIRTH'S STAINLESS STEEL** was absorbed in the manufacture of articles of national necessity, and its ability to withstand the action of sea water and of high temperatures respectively, combined with its mechanical properties as a high-grade steel, rendered it invaluable to the Royal Navy and to the Royal Air Force.

The future possibilities of **FIRTH'S STAINLESS STEEL**, for the purposes of Industry, Domestic Life and Sport, are unbounded. It resists corrosive action, and this property is not superficial only, but is an intrinsic characteristic of the material itself. Wherever a steel is required combining a permanently clean, bright surface with strength, toughness or hardness, **FIRTH'S STAINLESS STEEL** will meet the demand.

THOS. FIRTH & SONS, LTD.,

public instead of secret, and the examinee ought not to be at the personal mercy of unknown examiners.

One or two examples have been given of the wooden-headed manner in which the regulations are being carried out. Everyone who has had dealings with the Department of Civil Aviation can supply further instances *ad lib.* But the real question is why this policy of official regulation and restriction exists. For, one must remember, it exists not only in aviation, but in almost every branch of British Industry. To investigate this we must go back a little in British economic history.

Some Commercial History.

Up to 20 years before the end of the eighteenth century, the Mercantile system was in operation in these islands. Under that system successive Governments made well-meaning but entirely futile attempts to foster British commercial prosperity, by means of Navigation Acts, Corn Laws, Corn Law Repeal Acts, prohibitions on the export of bullion, enormous tariffs on imports and bounties on exports. Adam Smith made a violent protest against this system of regulation and restriction in his "Wealth of Nations" in 1776, and his followers constituted the *Laissez Faire* school of thought.

By the beginning of the nineteenth century *Laissez Faire* held absolute sway as the official commercial policy. The Government gave up all attempts at regulation and controlling and wet-nursing industry, and practically all the restrictions on trade were removed with startling rapidity. Henceforth men were to be free to buy and sell how and where they liked. Competition was to be the sole driving and regulating force in commerce, and "leave-alone" would be the policy of the Government.

Following on that change, and helped enormously by the Industrial Revolution and the wide application of power to machinery, we had what has been called the golden age—a period of unprecedented prosperity. Our blast furnaces made England the forge of the world; our ships gave us three-quarters of the world's carrying trade; and the coal and steel and cotton and woollen industries made us in the nineteenth century the first industrial power in the world.

Social Reform.

That commercial prosperity brought with it an enormous number of social evils. It was the prosperity of the few; and the masses of workers were starved and sweated and cheated and injured. As a result, about the middle of last century a movement started towards the prevention of the more flagrant social evils, such as the working of children of eight and nine for 12 hours a day.

This movement necessitated, of course, Government interference with industry once more; though with a different motive this time, for its purpose now was to improve the condition of the workers' lot.

By 1886 this policy of control was firmly established, and gathering force each year, so that by 1914 it had brought us Factory Acts, Education Acts, Truck Acts, Employers' Liability Acts, the Trade Board (Disputes) Act, the Trade Board (Minimum Wage) Act, sanitation regulations in factories, the regulation of work in mines, and the control of industry in a multitude of other ways. The war came, and with it the necessity for Government regulation of output, both in kind and quantity. Dora and the Munitions Acts embedded the idea of the control of industry in every detail deep into the Government Departments.

The great industries can stand it. They were able to grow strong and prosperous untrammelled by official interference. The restrictions on the scandalous abuses of the Manchester cotton kings and the steel masters were socially absolutely necessary.

The Control of Civil Aviation.

But Civil Aviation cannot stand it. It is true that the safety of the public must be ensured; but quite obviously the interest of the Industry in that direction is the strongest possible check on unsafe flying. No one would quarrel with regulations securing crowds from risks from the air; but so far as other dangers are concerned, the monetary interest—to put it no higher—of firms is quite enough to secure, for the present, safety both to pilots and passengers.

It is one thing restricting a strong and lusty man; it is quite another thing restricting an infant that has not yet learnt to walk. If the same methods are used in the latter case as in the former the child will soon be dead.

Commercial aviation is that child. It has only just been born from the womb of time. It cannot walk yet; and it is surrounded by officials of the Civil Aviation Department, who at every step it attempts give it a blow on the head with a Regulation. Either the child will die or the officials must go. Public opinion in the world of aeronautics is all in favour of the child, and is unanimously determined to insist on the obstructionists in the Department being kicked out, if for no other reason than *pour encourager les autres.*

FLYING DEMONSTRATIONS IN SPAIN.

The Air Ministry announced recently that the three British machines which recently flew to Madrid for the purpose of exhibiton flights have now returned. Though somewhat belated, the adventures of these pioneers is worth recording.

"A D.H.4 machine, with a Rolls-Royce 'Eagle' engine, left Madrid at 6 a.m. and arrived after two stops, at Pau and Tours, at 8 p.m. the same night at Biggin Hill, having covered 855 miles in 8¾ flying hours. The pilot of the machine was Capt. H. H. Square, who had with him Lieut. J. P. Anderson as observer. The time occupied in the flight is all the more remarkable since they experienced heavy rain and wind all the way from the other side of the Pyrenees to Tours and thick fog from the Seine to Biggin Hill.

"Capt. Square skimmed the peaks of the Pyrenees, which are over 15,000 feet, with only 150 feet to spare, much to the amazement of some of the villages near the mountain tops. On the outward journey also bad weather was encountered on practically the whole route. The pilot reports that at Hendaye it was necessary to repair a flying wire which had been broken through hitting a bird when flying low. While at Madrid the engine was completely overhauled in the Spanish Air Services workshops at the aerodrome 'by extremely capable mechanics.'

"The Bristol Fighter, pilot Major L. G. S. Payne and observer Major C. G. Coe, left Madrid at 6.30 a.m., and after stops at Vittoria, Pau, and Tours, reached Hawkinge Aerodrome, Folkestone, at 9.30 p.m. The journey was uneventful.

The Result of a Rainstorm.

"The 4-engined Handley Page with Major Darley, Lts. Kilburn and Murray and three serjeant-mechanics appears to have had bad luck on both outward and return journeys. After leaving Pau for Madrid the machine ran into a terrific storm of rain which stripped the fabric from the tip of the starboard propeller. The clouds all the way to Biarritz were from 500 to 5,000 feet up. Meeting another heavy thunderstorm at San Sebastian Major Darley decided to return to Biarritz, and made a successful landing on the beach, which is barely 50 yards broad and has a slope of 45 degrees.

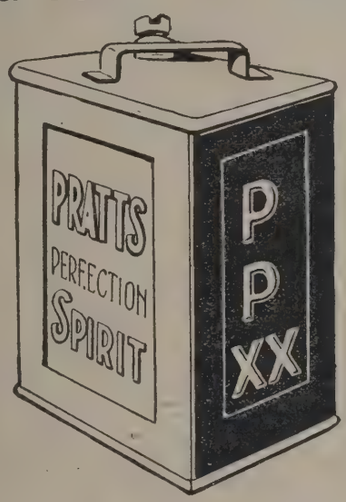
"While at Madrid a demonstration flight was undertaken to Barcelona. The machine carried seven passengers and four crew, together with 800 gallons of petrol, sufficient for the return trip. Amongst the passengers were the Duke of Durcal, Count Albiz, Col. Sanday, the British Attaché at Madrid, and two officers of the Spanish Flying Corps. The distance of 320 miles was covered in 4½ hours. The pilot records that the Handley Page caused great excitement at Barcelona. Both propellers were stripped by a heavy rainstorm on the return to Madrid.

A Mishap.

"On the journey back to England the machine safely negotiated the Pyrenees at 6,000 feet and was a few miles out at sea from Biarritz when a mishap occurred. A tremendous noise in the rear starboard engine suddenly arose. This engine was promptly switched off. It was then discovered that the propeller had gone, taking with it two engine stay-struts and a bracing wire, and also that a large hole had been torn in the top plane. The loosening wires caused the machine to veer to the right all the time. Major Darley planed down and, though the machine was barely under control, landed on the steep beach. Owing to the cross wind and the machine not steering properly, the pilot was unable to keep a straight course and the machine swung round and went about thirty yards into the sea. The incoming tide broke up the machine, but the engines were salved. The crew were very hospitably treated by the local authorities, who not only gave them clothes, but lodged them in the Royal Suite of the Palace Hotel. Major Darley managed to save the correspondence placed in his care by H.M. the King of Spain.

"An official report has been received from the British Air Attaché in Madrid that the visit of the British aircraft created a very favourable impression upon the Spanish people by demonstrating the practical developments of aviation. This is corroborated in congratulatory letters from the head of the Spanish Aviation Service, who, after referring to the 'magnificent quality' of the machines, says that the visit 'contributed powerfully to combine the friendliness between the English and Spanish Aerial Forces.'"

A CAPABLE TESTER.



Mr. J. H. Moore, who will be remembered as a particularly skilful pilot before the war, when he flew a machine of his own at Hendon, has now been demobilised from the R.A.F., and is open to take on work as a test pilot.

As an A.I.D. pilot, and later as an R.F.C. officer, Mr. Moore put some hundreds of machines through their tests during the war without ever having an accident other than minor mishaps caused by defects in the machines themselves. His record in this way is extraordinarily good, and therefore any firm open to engage a test pilot would do well to get in touch with him. Letters addressed to Mr. Moore, care of "The Aeroplane," will be forwarded at once.

CIVIL AERIAL TRANSPORT NOTES.

GREAT BRITAIN.

The Aircraft Disposal Department last week sold 300 Avro machines to Mr. S. W. Copley, managing director of Copley's Bank, Queen Victoria Street, E.C.4.

This is the largest individual aeroplane transaction ever made in England, and includes all the new Avro machines in the possession of the Department.

Infringement of Regulations.

The Air Ministry announces that, though the air navigation regulations have been in force since May 1st, and pilots and others have now had ample opportunity of acquainting themselves with the regulations, numerous instances of their infringement are still being reported. The regulations were made with a view to securing the public safety, and in future, proceedings will be taken when they are contravened.

The public are requested to co-operate with the Ministry by forwarding to the Secretary (C.G.C.A.), Air Ministry, London, particulars of alleged offences, including, if possible, the registration number or mark of the machine in question

The most common instances of infringement are:—Dropping leaflets and other advertising matter; taking up and landing passengers as a regular proceeding at places which have not been licensed as aerodromes; low flying, either over towns or to the danger of the public elsewhere; neglecting to obliterate military markings when a machine has ceased to be a military machine; and obscuring registration marks by means of advertisements or otherwise.

Flights to Amsterdam.

The Amsterdam Aircraft Exhibition opened on August 1st. British firms are to be well represented, but their exhibits will not be shown until August 11th.

The Air Ministry announces that pending a definite agreement on the basis of the Air Convention, and in order to enable Dutch and British Aircraft to visit England and the Netherlands, should they so desire during the exhibition, arrangements have been made with the Netherlands and Belgian Governments for the temporary opening of civil communication by air between the Netherlands and Great Britain.

In view of the distance of the sea passage from the east coast of England to Holland, seaplanes only may cross by this route, and aeroplanes will proceed to Holland *via* the Straits of Dover, France and Belgium. Arrangements have been made, by the courtesy of the Belgian authorities, for a refuelling base at Evère, near Brussels. Aeroplanes proceeding to Holland by this route may cross the Belgian frontier at any point which may be suitable.

The following is the text of the agreement with Holland:—

(a) Except in emergency, both seaplanes and aeroplanes entering Holland must land at Amsterdam.

(b) Except in emergency, aircraft entering England must land at :—(i) Seaplanes, Felixstowe; (ii) Aeroplanes, Lympne or Hounslow.

(c) Seaplanes will cross the Dutch coast between Scheveningen and Ymuiden. Aeroplanes entering Holland *via* Belgium may cross the Belgian frontier at any point which may be suitable.

(d) Seaplanes will cross the English coast between Orfordness and the Naze; aeroplanes between Folkestone and Dungeness.

(e) All machines and pilots taking advantage of these facilities must be provided with and carry such documents as may be required by their respective Governments, or by the competent authority.

(f) Passports will be carried by both passengers and crews, but such passports will not require the Dutch visa on leaving the United Kingdom if the period of stay in Holland does not exceed two days.

(g) No goods must be carried, either on the outward or return journey, without Customs formalities being observed.

(h) If aviation material is destined definitely for Holland, Customs dues must be paid.

(i) No photographic apparatus for use during the voyage may be carried.

(j) A manifest of goods carried under G and H, and a full list of passengers under F, will be carried by the pilot in charge of the machine.

The forms referred to in (g), (h), and (j) are as follows:—

Aircraft report and description of cargo, Form 150.

Notice of intended departure with goods, Form 151.

Manifest of general declaration of cargo, Form 152.

Pilot's declaration and clearance (outwards) without goods, Form 153.

Pilots intending to fly to Amsterdam will be afforded all available information in regard to aerodromes and including aerial route directions, etc., and copies of the above forms on application to the Controller-General of Civil Aviation, Room 521, Kingsway, W.C.2.

The Executive Committee of the Amsterdam Exhibition have made special arrangements that visitors from Britain to the exhibition shall be provided with hotel accommodation.

"Daily News" Flights.

The "Daily News" arranged to give 365 free flights during the week-end between August 2nd and 6th, at Cricklewood, Brighton, Bournemouth, Hastings, Ramsgate, Southend, and Weston-super-Mare.

Another Civil Aviator.

Another R.A.F. officer who is now engaged in civil aviation is Capt. A. H. Curtis, late R.A.F. Capt. Curtis joined the Central Aircraft Company some little time ago, and is now piloting their machines at Northolt.

Blackpool.

So strong was the wind at Blackpool last week that it lifted several of the machines five feet from their sandbag moorings on the beach. Naturally, the mechanics standing to their machines had the wind up.

As usual, Blackpool provided the largest number of passengers, amongst whom was Mr. Bracegirdle, a Manchester fish merchant, who took advantage of the Avro daily service between Blackpool and Manchester to send several hundredweight of fresh Fleetwood fish. Probably these were the first fish ever to travel by air. The journey between the two towns is scheduled to take 45 minutes, as the machine stops at Southport on the outward and inward trips, but even with this stop the train journey is well beaten.

The ten thousandth passenger was taken up last week at Blackpool, which is fairly good business considering that the flying there did not start till the middle of May. There has been no accident during the period with the exception of one machine, which landed in the sea owing to the high tension lead dropping off. The Avro motto of safety first which is painted on large notice-boards all round the aerodrome is well maintained. So confident are the public nowadays that they turn up for flights in any weather, rain, blow, or hail, whereas when the show started, they would not look at a machine if there were the semblance of a wind. Several days last week regular passenger flying was carried out in winds of between 30 and 40 m.p.h.

Several five-seater machines, fitted with 160 h.p. B.R.1 engines are now in use, which reminds one of a recent conversation with an alleged flying expert who rather gave himself away by calling the B.R.1 the Beardmore engine, and this despite the fact that he said he had been several years in the R.F.C. in France.

A blind man is to fly at Blackpool and to describe his experiences.

Capt. Pownall, one of the Blackpool pilots, returned from Manchester the other day on the routine flight, and found the tide up to the barriers on the sand. Nothing daunted, he landed in a disused road running down to the beach.

A small circus left Blackpool on Mono Avros last Monday for Amsterdam, where they will fly *via* Lympne and Brussels. Capt. W. G. R. Hinchcliffe, D.F.C., A.F.C., was in command, Lieut. Brown, Lieut. Shanks, Lieuts. Roberts and Inglis being the other pilots. Their places have been filled by Capt. Tully, A.F.C., late Wing Examining Officer in the Midland area, Lieut. Salthouse, and Lieut. Hudson.

The new international aeroplane numbers seem somewhat complicated. One Avro machine for Holland was painted G.E.A.I.H., which some wit stated must mean "German Emperor Arrives in Holland"; someone suggested another place beginning with an H would be more suitable!

Lancaster.

Lieut. Macrae, M.C., was the sole occupant of the Government hangars at Scale Hall, Lancaster, last week. No Service officers or men were there, and this despite the fact that Scale Hall Aerodrome is supposed to be one of the few Government places where civilian flying is catered for.

Leicester.

There is every possibility that an aviation ground will be established by an up-to-date company near the city. The Leicester Aviation Club will thus realise its ambition.

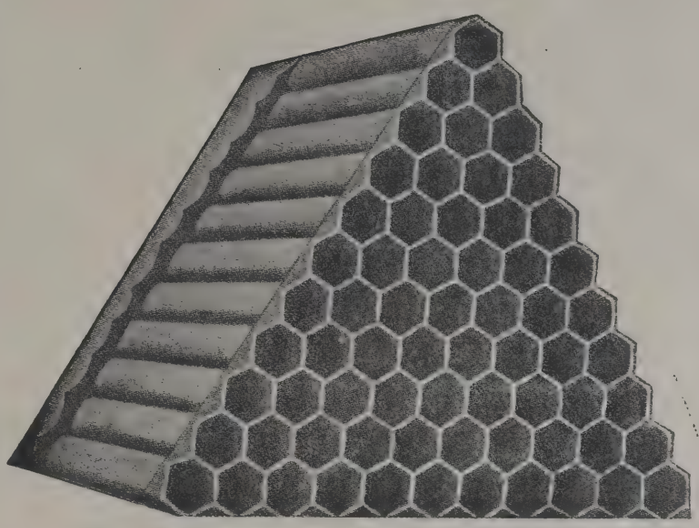
London.

Cricklewood.—Members of the British Guiana Colonisation Deputation made a flight over London on Judy 31st on a Handley Page.

Hendon.—Vast crowds of people refrained from visiting the Hendon Aerodrome on Saturday, Aug. 2nd, and, doubtless, those who did not attend, enjoyed a pleasant afternoon. The Grahame-White char-a-banc did not run to the flying ground, though there might have been a sufficient number of visitors to fill it.

These enthusiasts paid threepence each for the usual programme that had blank spaces in which the purchasers could write the names of the starters in the 20-mile cross-country Air Race for the London Aerodrome Trophy and 20 sovereigns, and second prize of the London Aerodrome Medal and 10 sovereigns.

Six names were put up on the notice-board, viz., Capt. P. R. T. Chamberlayne (Grahame-White Bantam, 80 h.p. Le Rhône), Lieut. G. R. Hicks (Avro, 110 h.p. Le Rhône), Major R. H. Carr, A.F.C., D.C.M. (Avro, 110 h.p. Le Rhône), Capt. D. H.



ABOUT THE BEST CONCEIVABLE TEST OF RELIABILITY.

THE RADIATORS of the Airship R34

have

CROSSED the ATLANTIC TWICE

And under terrific conditions kept their five engines cool all the time.

These Radiators were all made by

JOHN MARSTON LIMITED,

OF WOLVERHAMPTON.

Aviators should beware of faulty Radiators and to insist upon Marston's because THEY ARE THE MOST RELIABLE.

H. M. HOBSON, LTD., 29, Vauxhall Bridge Road, London, S.W.1.

Robertson, A.F.C. (Avro, 110 h.p. Le Rhône), Lieut. C. Turner, A.F.C. (B.A.T. "Baboon," 170 h.p. Wasp), and Capt. Hammersley (Avro "Baby," 35 h.p. Green).

It was advertised that the race would start at 4 p.m., but there were no signs of aeronautical vitality at the time. After waiting for some time in hot sunshine, a few of the straggling knots of dejected people adjourned to the tea room, where they paid two shillings a head, and continued to wait.

The time was, however, enlivened by a man with a megaphone, who announced that three of the six competitors had scratched. A pathetic spectacle was afforded by two bookmakers who, in the vast desert spaces cried the odds, but apparently without luring any backers.

At a quarter to five a rain-storm broke, and as the few visitors ran to seek shelter the three machines that were not scratched started. Rain continued during the race, which consisted of five laps of Brittacy Hill and aerodrome pylon circuit.

Major Carr (Avro, 110 h.p. Le Rhône), won the event, time 18 mins. 35 secs., and Capt. Robertson, on a machine of the same type, gained the second prize, time 20 minutes 26 secs. Lieut. Hicks, also on an Avro-Le Rhône, did not complete the last circuit.

It was a depressing day.

The "exhibition" on Monday was of much the same tameness as on Saturday. The "pièce de résistance"—a cross-country race to Bittacy Hill and back drew four starters, but Lieut. G. R. Hicks, retiring after the first five laps, owing to engine trouble, left the race to be contested by the remaining two G.-W. machines—the Avro, piloted by Major Carr, A.F.C., D.C.M., and the G.-W. Bantam, piloted by Capt. Chamberlayne, Capt. Vaughan, on the B.A.T. "Baboon," being entirely out of the running, owing to high flying and wide cornering. Major Carr led all the way and finished 10 seconds in front of Capt. Chamberlayne.

There was much activity in the passenger-carrying line by the usual G.-W. Avros, Kangaroos, and also Airco D.H.9s, etc. Mr. Newall repeated his double parachute descent from a Kangaroo, but, owing to misjudgment and wind, landed outside the aerodrome on some trees. Some excellent flying was done by Capt. McElvey (late 45 Squadron R.F.C. and R.A.F.) on a Bristol Bullet (80 h.p. Le Rhône).

Hounslow.—Sir Hari Singh of Kashmir flew to Swanage and back on Sunday, August 3rd, in an Avro. Other cross-country flights were made during the week ending August 5th to Crewe, Southampton, Margate, Worcester, and Swansea. Another machine was taken for the week end and flew to Cowes and Dover. Avros were sent for the Bank Holiday to the North Somerset Agricultural Association Fair at Bristol.

Isle of Man.

A. V. Roe and Co. intend starting a mail service daily between Blackpool and Douglas.

The flying season was opened on July 29th by the septuagenarian Mayor of Douglas, who flew as a passenger, piloted by Lt. Moxon, in an Avro machine, which afterwards took up many passengers at a guinea a head.

Lt. Moxon has been busy all the week on a small stretch of sand on the beach at Douglas, Isle of Man, where he receives many inquiries as to when the cross-Channel service is to start, and this is not to be wondered at when one sees queues half a mile long on the Liverpool landing stage waiting for boats. Indeed, one man arrived at Southport the other day about 9 p.m.—it was blowing a gale and the clouds were down to the ground—and offered £200 to fly to the Isle of Man, because his wife was there and he wanted to surprise her!

On August 4th an Avro seaplane, piloted by Captain Pixton, left England, shortly after 6 a.m. with parcels of the "Daily News" weighing about 3 cwt., and alighted in Douglas Bay, close to the shore, at 8.5 a.m.

In the ordinary course, English newspapers do not reach the island until late in the afternoon, and delivery was expedited by eight hours.

Manchester.

Mr. Bracegirdle, a Manchester fishmonger, had a cargo of fish, weighing 12 stone, taken from Fleetwood to Manchester on Aug. 1st in an aeroplane. The journey took half an hour (51½ miles), and the fish was on sale three-quarters of an hour after the start.

To mark the event, Mr. Bracegirdle presented the Lady Mayoress with two turbots. It is believed that they had not survived the journey.

Margate.

For the week ending August 5th, 107 passengers, including 20 "Daily News" Free Flight passengers were taken up in Avro's.

New Brighton.

A one-legged high diver from New Brighton wishes to dive from an Avro in flight into the Mersey at Liverpool.

Preston.

A fortnight elapsed between the date of inspecting the proposed aerodrome at Preston and the granting of a temporary licence for flying there. This is fairly quick work for the Air Ministry.

Rhyl.

A record week's flying preceding August Bank Holiday is reported from the North. The Avro chain of air stations in Lancashire is now complete, Rhyl, in North Wales, being opened last Monday, when Major McMinnies, A.F.C., Capt. E. Maitland-Heriot, D.S.C., and Lieut. Hudson were flying.

Scotland.

St. Andrews.—Avro machines are flying from Leuchars to St. Andrews to take up passengers on August 6th-9th inclusive. The machines will operate form the stretch of sand to the west of the town.

Sheffield.

The Vickers Vimy commercial machine, which was flown by Capt. Sir John Alcock, K.B.E., D.S.C., during the Sheffield flying week, brought a total load of 13 people from Sheffield to London on July 29th. Nine of them were business men com

nected with Vickers Ltd. The machine left Coal Aston aerodrome at 3.20 p.m., and arrived at Hounslow at 5.35 p.m. The passengers then motored to the offices of Vickers, Ltd., in Knightsbridge, where they arrived at 5.50 p.m.

SOUTHAMPTON.

Bournemouth had a daily aerial passenger service last week from Southampton, by a Supermarine four-seater, Channel type flying boat fitted with an 160-h.p. Beardmore engine, and having folding wings. Large numbers of visitors at Bournemouth were taken for flights.

On July 30th a woman of 72 and a man of 75 were taken up. Several trips were made from Southampton to Cowes with passengers having important appointments who missed the steamer.

When it is allowed the service will be extended to the north coast of France, calling at Cherbourg, Le Havre, and St. Malo.

Mrs. Leon Errol, a passenger from New York on the "Aquitania" which arrived at Southampton on August 2nd, flew from Hamble to London on that date.

Six weeks ago Mrs. Errol flew from London to catch the "Aquitania," as she had missed the boat-train

SOUTHPORT.

Southport was a good second to Blackpool, quite half the passengers being women. Six of the fair sex said that they wished to learn to fly, so keen have they become after the first few preliminary flights. It is generally found in these cases that the passengers are not satisfied until they have done everything that there is to be done in the air. This statement need not be taken entirely from a flying point of view, as an inquisitive pilot, finding his machine rocking considerably, turned round to see what was the matter and discovered his passengers enjoying for the first time an aerial embrace! Apparently from subsequent observations—taken on the sly—this form of amusement is by no means rare.

The Mayor of Southport, Ald. T. Wood, is becoming a keen passenger flier. He was looped and spun for the first time last week.

SWANSEA.

On July 26th Councillor George Hemmings opened the proceedings and was the first passenger to fly from a public aerodrome in Wales. Enormous crowds watch the flying from the beach. Aeroplanes are practically unknown and the flying is the chief topic of conversation for miles round.

Since two Avro three-seaters started passenger carrying at Brynmill, near Swansea, on July 26th, more than 200 people have been taken up.

AUSTRIA.

On July 31st a large German aeroplane, owned by a German aerial navigation company, flew from Kamentz Podolsk, Russia (Government of Podolia), to the Aspern Aerodrome near Vienna, with 22 passengers. On her arrival at Vienna she was seized by the Allied troops stationed there and handed over to the Italian Authorities.

DENMARK.

The following is from the Danish correspondent of THE AEROPLANE:—

The American Army pilot, Capt. Batts, who had brought a Curtiss flying boat with a modern Curtiss motor to Norway, where he is said to have been engaged by the big Danish cinema firm, the Northern Film Co., for some sensational flights over the mountains, has sold his flying boat to the Danish-American millionaire, Mr. John Larson, who crossed, with the former as pilot, the Skager Rak from Norway to Skagen, Denmark, flying next over his native city Sæby, which he had left as a poor farmer boy, dropping now, as the rich manufacturer of ice-producing plants, a present to his old mother.

He extended his flight from Copenhagen over five countries by continuing to Stockholm, after a night tug owing to the exhaust of petrol, and on to the new Baltic nations, Finland and Estland.

On the return to Denmark, Capt. Batts taught the Danish flying-boat pilots spinning, and with the Naval Air Service officers as observers took motive pictures of the capital and chief provinces in aid of the Sleswig Fund.

The Nielsen and Winther Works have, since their first contract for six Nieuport type scouts to the Danish Army, only produced a two-seater of this type, now handed over to the Danish Lieut. Jarfelt, chief of the Bolivian Air Service, for demonstration out there, a two-seater seaplane and two cheap flying boats to private order of a Danish and a Norwegian pilot, while a twin-engined flying boat, announced for the show to the order of a piano manufacturer for transport of his goods to England, two at a time, has not appeared so far. Nielsen and Winther have through their Hankow branch approached the Chinese Government for an exclusive concession for aeroplane manufacture in that country.

A company has been formed in Iceland to establish regular aeroplane traffic between the various towns and other countries. Capt. Cecil Faber is on the way to Iceland with aeroplanes and mechanics. The main base will be at Reykjavik.

FRANCE.

The following is sent by the Paris correspondent of THE AEROPLANE:—

From Aug. 1st, the Postal Authorities ceased to have any direct interest in the exploiting of aerial posts. This decision was reached owing to difficulties with an unsympathetic Treasury, and because the Chamber approved a motion according credits in the form of subsidies to aviation exploiting concerns. Also those high up in the Postal Services were anxious to retain their posts and were disinclined to commit themselves to any fixed programme. Thus ends the first year's experience and experiment in running aerial posts since it was in July, 1918, that an agreement was arrived at between the Postal Authorities and the Military Aviation Authorities.

Louis Bréguet, under guise of the company, "Messageries Aeriennes," has been running a daily service between Paris and Lille and vice versa. Each day, a pilot takes 100 to 150 kilos. of correspondence to Lille, and returns with a similar amount. Thus is the whole mail of Lille, Roubaix and Turcoing. From May 1st to July 30th the service has been interrupted only three times.

The scheme of prolonging this route to Brussels is being contemplated.

A Frenchman, Jean Ors, won the parachute competition at the Atlantic City Exhibition.

This week has seen the finishing touches to the many preparations made at seaside resorts to cater for the aviation-loving public.

The Compagnie Transaerienne have just put two dirigibles into commission called the Transaerien VI and the Transaerien VII.

The Transaerien VI is an Astra dirigible of 10,000 cubic metre capacity, fitted with two Renault motors of 250 h.p. each and a gondola capable of holding 14 to 16 passengers. It will be piloted by a marine officer loaned for the purpose by the French Naval Authorities.

This dirigible is to make "joy-ride flips" in the neighbourhood of Paris. Whenever the weather is propitious it will be flown to the battlefields and back, starting from and returning to the St. Cyr hangar.

The Transaerien VII is a Zodiac dirigible of 3,000 cubic metres and can carry, besides the pilot and mechanic, five passengers. This airship is to transport travellers from Havre to Deauville, and vice versa. Trips will also be made over the surrounding country, and these flights will appeal to everyone who knows the difficulties in crossing the Seine at this point.

The Société des Transports Aeronautiques du Sud-Ouest, of which Lt. Gindner is the moving spirit, has sent its first machine to Biarritz. Bordeaux was reached without a stop by Dupont, accompanied by Mechanic Alexandre.

Their aerodrome at Biarritz is called "Chambre d'Amour et la Négresse." The arrival has been planned for midday. Ten thousand leaflets will flutter to the ground announcing in true showman style the opening of the flying school, and imploring one to visit the Silver country and the Basque country at a price of 2.25 francs per kilometre by aerial taxi, or 1.25 francs the kilometre on the Goliath aerobus.

The Société T.A.S.O. have conceived the novel idea of fixing strapontins to the seats in the Goliath, thus increasing the accommodation by 6 to 20 persons.

The Compagnie Aerienne Francaise is charging 5 francs the kilometre for passenger flights. This Company has bought its machines at the liquidation of stocks at about £120 apiece.

The Bréguet firm have sent a 450-h.p. Renault-engined machine to the Amsterdam exhibition, fitted with five machine-guns.

The Caudron firm have also sent several machines.

La Maison Renault have just constructed a big twin-engined machine capable of carrying 20 persons.

Blériots are now constructing a new four-engined 1,200-h.p. machine with a 29 metre span and 150 metre supporting surface. It is designed to carry 28 passengers and fly 6 hours' non-stop.

A certain M. Schneeheli is busy experimenting with a new type of silencer on a F.50 at Villacoublay. It has already been passed by the Army.

From July 27th the postal aeroplane Nimes-Nice which used to arrive at the Californian aerodrome about midday will arrive at 9 in the morning.

After flying from Paris to Rennes and back, a voyage of 680 kms., M. Poulet left for Brussels, in order to take part in the Victory Fêtes there. The 370 kilometres was accomplished in 2 hrs. 47 min. After having taken photographs of the procession of the Compagnie Aérienne Française, he returned to Paris. He states that since July 14th the Le Rhône engine of his machine has done 3,000 kilometres. M. Poulet intends to attempt a flight from Paris to Melbourne (2,000 kms.), and hopes to start next month.

—F. T. N.

HOLLAND.

The E.L.T.A. Exhibition consists of the following 17 sections: (1) An historical group; (2) aeroplanes: (3) seaplanes; (4) engines; (5) motor-cars and cycles; (6) aeroplane building, with sepa-

rate parts and tools; (7) photographs, maps, and literature; (8) telegraphy and telephones; (9) orientation and lighting; (10) implements; (11) meteorology; (12) experimental aeroplanes; (13) medical; (14) clothing, equipment, and heating; (15) scientific; (16) military; and (17) naval. The exhibition was officially opened by M. Koenig, Minister for Public Works, after a speech of welcome by General Snyders, the ex-Commander-in-Chief of the Dutch Forces, and Chairman of the Committee of the exhibition.

On Aug. 2nd a Dutch naval seaplane, while trying to alight on the river, struck the roof of the Hillens machine-works, Serjt. Kroege, the mechanic, was killed, and Lieut. Bakker, the pilot, had his leg broken.

An F.5 flying boat fitted with two 350-h.p. Rolls-Royce Eagle engines, built by the Gosport Aircraft Co. for the Air Ministry, was successfully put through her trials on July 28th.

On July 30th the machine proceeded to the Amsterdam Exhibition, where it is being exhibited, with Lieut.-Colonel Ralph Hope Vere, A.E.C., as chief pilot. The others on board were Dr. Bisschop, the Legal Representative of the Dutch Government in England. Mr. M. H. Volk, the General Manager of the Gosport Aircraft Co., two other passengers, and a mechanic.

The flying-boat left Southampton at 2.50 p.m. and dropped a message at Brighton addressed to the Mayor of that town.

Amsterdam was reached in under five hours. It is a journey of about 340 nautical miles. Important Government mail was carried for the first time.

INDIA.

A detailed scheme for an inland aerial postal service in India is being considered by the Government of India, and shortly a mail service will be started between Bombay and Karachi.

A service will probably be instituted early next year. It will link up Delhi, Simla, Bombay, Calcutta, Karachi, Poona, Lahore, and Madras.

A number of private firms have offered to provide services between inland towns, but the Government has definitely decided on a State service.

A feature of the new service will be the speedy delivery of the English mail on its arrival in Bombay.

ITALY.

On Aug. 2nd a Caproni biplane, carrying some 14 persons in all, crashed near Verona. The machine was flying at a height of 5,000 ft., when it caught fire and fell. All the occupants were killed, including Capt. Luici Ridolfi, who was well known as a war aviator, and several newspaper correspondents. The aeroplane was making a trial flight from Milan to Venice, and carried five Italian journalists, the rest of her compliment being people from the Caproni works. Among the journalists were Signor Oreste Cipriani, one of the oldest members of the staff of the "Corriere della Sera," Professor Tancredi Zanghieri, who only recently became one of the leading editors of the "Secolo," Signor Bruni, of the "Sera," and Signor Bisi, of the illustrated publication, "Il Mondo," and all had been appointed to make the trip and to describe the journey to Venice.

NORWAY.

The following is from the Danish correspondent of THE AEROPLANE:—

Last year saw the formation of the first three Norwegian aircraft enterprises—first, the Nordisk Luftkraft A/S, which arranged the first Scandinavian aero exhibition in Christiania, 1918, and an emergency aerial mail by Lieut. Riiser-Larsen on a Thulin-built Morane monoplane, when the railway service was interrupted by embankment slip.

Secondly, the Norwegian Air Shipping Co., to which the public has been asked to subscribe in small shares, and of which Capt. Dehli, of the Navy, is technical director. So far nothing has been done, but the company will make its chief aim the establishment of national aerial lines, owing to the limits placed upon railway lines on account of the mountainous character of the country; and, further, will run a North Sea line to Great Britain, and, together with Swedish and Danish firms, a line to Gothenburg and Copenhagen.

The third enterprise is the Norwegian Aeroplane Works, Ltd., in Orsnes per Tonsberg, formed on June 4th, 1918, with a stock capital of towards £30,000. No aircraft have been turned out yet, but scale drawings are shown of a number of contemplated designs. Repairs of automobiles, motors, and boats are undertaken.

SOUTH AMERICA.

Lieut. Antonio Locatelli, the Italian pilot, left Buenos Aires on July 23rd to fly over the Andes on a machine fitted with a 220 h.p. S.P.A. engine. Owing to unfavourable weather he was obliged to land at Mendoza, which is 156 miles from Valparaiso (Chili).

He left Mendoza at 7.20 a.m. on July 30th, and crossing the Andes at 20,000 ft. arrived at Valparaiso at 9.25 a.m.

He arranged to leave for Santiago in the afternoon of the same day. General Diaz has referred to this pilot as Italy's Ace of Aces.

SWITZERLAND.

The Swiss aviator M. Handemann was killed on August 3rd while flying from Switzerland to Munich.

U.S.A.

A hurricane, accompanied by vivid lightning, wrecked most of the hangars and buildings on the Roosevelt Field, Long Island, on July 28th, where R.34 was moored on her arrival in America.

The storm destroyed three of the largest aeroplanes in America, a Caproni, a Handley Page, and a Martin bomber. The Handley Page weighed 11 tons, and was swept away and crashed at some distance, despite the efforts of 30 men to hold it down. The Martin bomber was going to fly across the United States from the Atlantic coast to the Pacific, starting on August 1st.

It is believed that the hangars were struck by lightning. A large rent was made in one of them, and as they were all of flimsy structure they collapsed very quickly.

AIRCRAFT FINANCE

CURRENT TOPICS.

The Whitehead Affair in Abeyance.

Having regard to the amount of capital involved, it is not surprising that the affairs of the Whitehead Aircraft (1917), Ltd., still excite quite a lot of attention. The further hearing of the petition presented by the New Pegamoid Co. for compulsory liquidation resulted in a decision being postponed until the next sittings of the Court. Mr. Gore-Browne, K.C., who appeared for the Whitehead Co., and also Mr. Whitehead, said that there was a chance—an extremely good chance—that a very large sum of money would be put in to pull the business together, a sum sufficient, after paying off all the creditors, to leave a large amount for the development of the business.

Prospective Purchasers.

Nothing was mentioned in the Court that would give a clue to the identity of the people who wish to secure control of the undertaking. In the City, however, certain names are being whispered, and further developments, towards the completion of affairs in the Courts are awaited with interest. Those who are pecuniarily concerned as shareholders should not be impatient.

The Labour Troubles.

The Stock Exchange, and indeed the whole of the financial world, is worried by the uncertainty of labour. The effect is aggravated by deficient working of the digestive organs consequent upon recent excessive borrowing. The result is a fall in prices and a feeling of discomfort.

The Handley Page Shares.

Aircraft and kindred shares are affected like everything else. An exception, however, is provided by Handley Page new participating preference shares, which are being picked up at about 16s. 6d. These were issued at 21s. in April, so that the original subscribers may be disappointed at the behaviour of the market. However, it is argued now that the company is developing its foreign trade and, allowing for the smaller Government business, is doing quite well at home.

Lower Prices Ruling.

The shares of the Aircraft Manufacturing Co. are not active. The first preference are quoted 16s. 6d. and the "B" 16s., and are not a very firm market. Peter Hooker preference are standing about 16s. 9d., and Armstrong, Whitworths at 35s. and Vickers at 35s. 6d. are being picked up by investors. Both seem to be attractive as a long shot by those people who are sufficiently confident in the immediate future. There has been a fall in English Electrics, which have an important and permanent interest in aircraft.

By Air, Limited.

One is impressed with the ingenuity shown in connection with some of the new ventures associated with aerial transport. Unfortunately little is usually heard about them beyond the original registration.

With a capital of £2,000 in £1 shares, of which 1,000 are preference shares, there has just been registered a venture entitled By Air, Limited. The object is to adopt an agreement with W. R. Johnson, T. T. Laker, J. W. Batchelor, and E. W. Saward, trading as the Aerial Transport Co., to establish, etc., services of aerial conveyances and aircraft of all kinds. It is apparently domiciled in Coventry.

A Swiss Project in Detail

More than the ordinary quantity of detail accompanies a report concerning an aerial project for linking up the chief cities and resorts in Switzerland. Hydroplanes are to be used principally, but aeroplanes will not be ignored. It is proposed to start with six stations—Geneva, Lausanne, Lucerne, Lugano, Thun or Interlaken, and Zurich—to which three machines with the requisite spare parts, will be allocated initially.

Capital and Estimated Earnings.

The capital is estimated at 1,500,000 francs (£60,000), the annual expenses at 1,000,000 francs (£40,000), and the receipts 1,200,000 francs (£48,000). The margin of profit, therefore, would be 200,000 francs (approximately £8,000). The calculation is based on 2½ hours' flight per day per machine, for not more than 100 days a year, the life of the machine being taken at two years with 500 hours of flight.

What it Represents.

Presumably the calculation of profit is allowed for after adequate provision for depreciation. If so, the specified amount would be equal to 13.3 per cent. on the capital, and the percentage of net profits to earnings would be 16.8. On paper it sounds all right, but it must be confessed that the information is inconclusive and incomplete. Anyway, it is not without interest, and on British standards the capitalisation seems to be quite moderate.

More Propaganda Needed.

By the way, why is it that one hears more of these foreign projects, some of which are embellished with more imaginative genius than sound sense, than British ventures? It is useful to know what is going on abroad. Possibly more propaganda work is called for in connection with domestic schemes, and propaganda more elaborate than cheap joy-rides designed to advertise any particular newspaper.

New Capital.

The new extensions for which S. Smith and Sons (Motor Accessories) need the additional capital comprise control of the M-L. Magneto Syndicate, and also the K.L.G. sparking plug. Another item of interest is that C. A. Vandervell and Co., whose shares were recently "introduced" to the Stock Exchange, will shortly issue £300,000 6½ per cent. debentures at £98, in order to cope with the growth of the business.

The Fiat and the Humber Cos.

Like everyone else the Fiat Co. is increasing its capital in order to develop business. The amount is to be doubled to 200 million lire. The Humber Co. now presents its accounts for the financial year to August 7th, 1918, the delay being ascribed to difficulties in valuation of stocks and inability to define Excess Profit Duty liability. The gross profit is £97,677 and the net £70,875, the latter comparing with £45,029 for the preceding 11 months. For the period under review dividends on the ordinary shares were resumed after a lapse of many years with a 6 per cent. payment.

NEW COMPANIES.

Great Northern Aerial Syndicate, Ltd. Private company. Registered June 12th. Capital, £10,000 in 5s. shares. To enter into an agreement with W. E. Cooke and to carry on the business of advisers, organisers, promoters, managers, accountants, secretaries, agents, etc., especially in the business of commercial aviation, manufacturers and designers of aircraft, proprietors of schools of aviation, etc. The first directors are:—C. Sutherland 2, Garston Old Road, Liverpool, advertising agent; C. H. Bullen, Lyndhurst, Halkyn Avenue, Liverpool, advertising agent; R. H. Taylor, Hill Place, Fishergate, Preston, gentleman; W. J. Todd, 17, Lawson Road, Seaforth, aero engineer; W. E. Cooke, 1, Vauxhall Road, Liverpool, leather merchant; E. G. Noakes, 30, Comeley Bank Road, Wallasey, advertising agent; L. E. Stephens, 50, Littledale Road, Wallasey, gentleman. Registered office: 25, Lord Street, Liverpool.

Handley Page Transport Co., Ltd. Private company. Registered June 14th. Capital, £200,000 in £1 shares, of which 100,000 are preference, entitled to a cumulative preferential dividend of 7 per cent. and two-fifths of the surplus profits available for dividends. Objects: To establish, maintain, manage and work lines and services of aerial conveyances and aircraft of all kinds and to carry on the business of carriers of mails, passengers, animals and goods by air, or otherwise, to enter into contracts with any person, firm or company, as to joint working, interchange of traffic, running powers or otherwise, to carry on the business of a transport company generally, and to acquire and provide aerodromes, air stations, flying grounds, flying schools, wireless telegraph stations, hangars, garages, sheds and other accommodation or erections in relation to aerial and other conveyances, to arrange competitions and trial tests for aviators, and to repair, hire, let on hire, ply for hire, and deal in all kinds of aircraft, etc. The subscribers (each with one share) are: F. Handley Page, 40, Claremont Road, Cricklewood, N.W.2, aeroplane manufacturer; T. Page, 40, Claremont Road, Cricklewood, N.W.2, aeroplane manufacturer. First directors: F. Handley Page and T. Page. Solicitors: Kimber, Bull and Co., 6, Old Jewry, E.C.

Aircraft Improvements Co., Ltd. Private company. Registered June 27th. Capital, £1,000 in £1 shares (50 founders). Agreement with Eric Neal and to carry on the business as aeronautical, marine and general engineers, manufacturers of and dealers in aircraft, aeroplanes, seaplanes, flying-boats, airships, observation balloons and appliances for aerial navigation, etc. The subscribers (each with one share) are:—E. Neal, 15, Elliott Road, Chiswick, W.4, aeronautical engineer. J. S. Cotman, 10, Coleman Street, E.C., C.A. Directors: E. Neal, J. S. Cotman, F. M. T. Lange and D. Gordan. Registered office: 10, Coleman Street, E.C.

AIRCRAFT IN PARLIAMENT

HOUSE OF LORDS.

As the result of an intense debate on July 30th, it was resolved in the Lords by 69 to 42 that a Select Committee should be appointed to examine the circumstances of the dismissal of Miss Violet Douglas-Pennant from the Women's Royal Air Force. The committee is to have the power to call witnesses, to take evidence upon oath, and to ask for the production of documents. This action has been taken by the Lords in defiance of the Government.

* * *

HOUSE OF COMMONS

The following written answer was given on July 28th :-

FLOOKBOROUGH AERODROME.

Dr. MACNAMARA, the Secretary of State to the Admiralty, replying to Mr. TYSON WILSON, said : The construction of a large aerodrome was started at Flookborough during the war, railway sidings were laid down and workmen's huts built, but it was discontinued owing to the shortage of steel.

The construction of this aerodrome cannot be continued now as it is not required. The building of the housing accommodation was proceeded with, and is now nearly finished.

Messrs. Vickers have been offered the option of taking over such work for the construction of the aerodrome as had been accomplished before the suspension.

* * *

The following written answers were given on July 29th :—

ROYAL AIR FORCE.—SUTTON AERODROME (DISCHARGES).

Mr. GEORGE THORNE asked the Under Secretary of State to the Air Ministry whether single women are being discharged from the Sutton Aerodrome, near Hornchurch, while married women whose husbands are in good positions are retained.

Major-Gen. SEELY : The inquiries in this case are not yet complete. I will communicate the result to the hon. Member at an early date.

GERMAN AIRSHIPS.

Lieut.-Col. MOORE-BRABAZON asked the Under Secretary of State to the Air Ministry how many German rigid airships will be allotted to this country under the terms of Peace; and whether the Air Ministry or the Admiralty will take the same over.

Major-Gen. SEELY : Under the Peace terms all German airships are to be handed over to the Allies, but the exact number to be allotted to this country has not yet been decided. The airships will be taken over in Germany by the Royal Air Force Section of the Inter-Allied Aeronautical Commission of Control, and their allotment as between the Admiralty and the Air Ministry will be determined by the decision made on the general question of responsibility for airships.

* * *

The following oral answers were given on July 31st :—

AIRSHIPS.

Captain WEDGWOOD BENN asked whether the Civil Aviation Department has under its control any airships; and, if not, what steps they take to carry out experiments, in view of the commercial development of this type of aircraft.

Major-Gen. SEELY : The Air Ministry has not at present any airships under its control. Valuable experience was gained by the Ministry from the flights of the R33 and R34, but these vessels have now been returned to the Admiralty

AIR SERVICES (UNIFIED CONTROL).

Lieut.-Col. MALONE and Mr. RAPER asked the Prime Minister, and Mr. JOYNSON-HICKS asked the First Lord of the Admiralty, whether and when the construction of airships was going to be handed over from the Admiralty to the Air Ministry.

Capt. W. BENN asked the Prime Minister whether the control of the airships could be transferred

Capt. W. BENN and Lieut.-Col. MALONE asked the Prime Minister whether the Air Service will have unified control

Mr. BONAR LAW : It has been decided that the lighter-than-air ships shall be transferred to the Air Ministry, and arrangements to carry this into effect are now being made

Mr. RAPER : Will they be transferred immediately or only on completion ?

Mr. BONAR LAW : The principle has been decided upon; the details are being arranged between the two Departments.

Lieut.-Comdr. KENWORTHY : Will they be available for experiments in commercial work, or are they only for naval and military purposes ?

Mr. BONAR LAW : I could not be expected to answer that question. That will be for examination. One of the questions says : "Value for commercial purposes," but I was not aware of that.

Lieut.-Col. MALONE : Will they be transferred for operational purposes ?

Major-Gen. SEELY : I could not answer that off-hand. When these ships are employed for military purposes they will be under the command of appropriate military authorities, whether of the Navy or Army.

Mr. JOYNSON-HICKS : When arrangements are made will a statement be published here ?

Mr. BONAR LAW : We shall certainly make any announcement that we can. Whether it will be necessary to make it when the House is not sitting we will consider.

AIR DIVISION (NAVAL STAFF).

Mr. JOYNSON-HICKS asked the First Lord of the Admiralty whether an Air Department is in existence at the Admiralty; and, if so, for what purpose.

The FIRST LORD of the ADMIRALTY (Mr. Long) : There is no Air Department at the Admiralty. There is an Air Division of the Naval Staff, which advises us in these matters.

Mr. LONG : All aircraft which work in conjunction with the Navy are under the control of the Admiralty for operations.

Lieut.-Col. MALONE asked the First Lord of the Admiralty whether the airships allotted for work with specific fleets are under the direct control of the Admiralty Air Department.

Mr. LONG : No, Sir. Any airships allotted for work with the Fleet are under the direct control of the commander-in-chief.

* * *

The following written answers were given on July 31st :—

AIR STATION, FELIXSTOWE (DISMISSALS).

Lieut.-Col. R. PEEL asked the Under Secretary of State to the Air Ministry whether he is aware that 176 civilian employees at the air station, Felixstowe, received a week's notice to leave on Saturday last without having had any previous intimation that their services were likely to be dispensed with; and whether, in view of the obvous hardship which must occur from displacement at such short notice, he will take steps to make some concession as to time so as to give the employees some reasonable chance of finding fresh employment.

Major-Gen. SEELY : The facts are as stated in the question. I deeply regret the hardship that is caused by the dismissal of civilian employees in this and similar cases, but the rapid reduction of the Royal Air Force to a peace basis renders such action unavoidable. Every effort will be made to give sufficient notice to enable men to find other employment, but such notice must in any case be short owing to the great reduction in working requiring to be done

GOVERNMENT POLICY

Mr. RAPER asked the Prime Minister whether the Government adheres to the declaration of policy, made by the Secretary of State for War on February 12th, that the integrity, the unity, and the independence of the Royal Air Force will be sedulously and carefully maintained.

Mr. BONAR LAW : The answer is in the affirmative.

MEERING v. THE GRAHAME-WHITE AVIATION CO., LTD.

On July 29th, Lords Justices Warrington, Duke and Atkin in the Court of Appeal, after an eight days' hearing, dismissed, on all issues but one, an appeal by the Grahame-White Aviation Co., against a verdict and judgment.

Mr. Meering was employed by the company last year and privately constructed an aeroplane of his own invention. The company charged him with stealing and receiving aeroplane parts and fittings. In the ensuing action Mr. F. C. Meering received £1,700 damages and costs for false imprisonment and malicious prosecution.

The part of the appeal which was allowed was that upon the issue of false imprisonment, and the damages for that issue were reduced from £250 to 1s. Mr. Meering's damages are, therefore, reduced from £1,700 to £1,450 and 1s.

A LIGHT SENTENCE.

At the Mansion House on July 31st, Douglas Newth, 24, lately a Lieutenant in the Royal Air Force, was charged with obtaining goods from City firms by means of worthless cheques. It was stated that the defendant had been doing secretarial work for a woman living in Tavistock Square, and was alleged to have stolen some blank cheques from her cheque-book. These he used in obtaining articles from Benetfink, Ltd., of Cheapside, and other firms. He represented himself in some cases as "Sir Robert Curzon" and in others as "Captain Wilson, Governor of Wormwood Scrubs Prison."

The defendant told the magistrate that he had served in the Army before and during the war and was twice severely wounded. He afterwards obtained a commission in the Royal Air Force and was twice smashed up. He was ill and starving when these matters occurred.

Sir John Baddeley passed sentence of four months' imprisonment in the second division on each of two charges, to run consecutively—eight months in all.

MANSLAUGHTER.

On July 29th the Poole Coroner held the adjourned inquest on the bodies of Mr. and Mrs. S. E. Jones, of Parkstone, who died under mysterious circumstances at Poole. They were picked up one dead and the other badly injured by two R.A.F. men and four civilians in a Government motor tender, on the night of the Peace festivities.

The driver of the car George Richard Woodhouse, and Hugh O'Neill his mate, both privates in the R.A.F., who are in custody on the charge of manslaughter, gave evidence.

Woodhouse said he should have taken the car back to the R.A.F. depot at Sandbanks, but thought they would have a run round and see what was doing as it was Peace Day. When they picked up the bodies of Mr. and Mrs. Jones it was light but raining. One was on each side of the road with more than room for the car between.

A civilian deposed to visiting various public-houses with the two R.A.F. men, but stated that all were sober. They did not see anyone in the road in front of the car.

A verdict of manslaughter against Woodhouse and O'Neill was returned.

NON-RIGID AIRSHIPS FOR SALE.

The Admiralty have for sale a number of non-rigid airships of the following types : Coastal, Coastal Star and S.S.Z. The airships will be sold complete with cars, engines, radiators, propellers, engine fittings, instruments, etc., but without wireless gear.

Forms of tender, giving particulars of the airships and facilities for inspection may be obtained from the Director of Contracts, Branch 10a, Room 81, West Block, Admiralty, S.W.1. The tenders for the airships will be received at the Admiralty up to 12 noon on August 12th.

Portable sheds, 170 ft. by 50 ft. by 56 ft. (to the crown of arch), suitable for S.S.Z. type airships are available for sale. Particulars of these sheds may be obtained from the Civil Engineer-in-Chief, Admiralty.

Silicol plants, which form part of the equipment of stations, are also available, and particulars may be obtained from the Director of Airship Production, 10, Smith Square, S.W.1.

NAVAL & MILITARY AERONAUTICS

GREAT BRITAIN.

FROM THE COURT CIRCULAR.

BUCKINGHAM PALACE, July 24th.

The King, who was accompanied by the Prince Albert, held an Investiture for the Royal Air Force in the Quadrangle of the Palace at 11 o'clock this morning

His Majesty conferred decorations as follows:—

THE DISTINGUISHED FLYING CROSS (contd.)

Lieut. Leo Baker, Lieut. Owen Baldwin, Lieut. Bernard Belcher, Lieut. John Bell, Lieut. Cecil Bridgland, Lieut. Harold Briggs, Lieut. Frederick Britnell, Capt. Frank Broome, Lieut. Colin Brown, Lieut. Lee Roy Brown, Lieut. Eldon Burn

Lieut. Austin Chadwick, Lieut. Sidney Chamberlain, Lieut. Joel Chrispin, Lieut. Percy Clayson, Lieut. Herbert Cockman, Capt. Douglas Colyer, Lieut. Alfred Corker, Lieut. Charles Coulson, Lieut. James Croden, Lieut. Alan Crosthwaite

Lieut. Douglas Davies, Lieut. Norman Dougall, Lieut. John Drake, Lieut. Goran Duncan

Lieut. William Eastaugh, Lieut. Cyril Eilen, Capt. Harold Ellison, Lieut. Charles Frank.

Lieut. William Gray, Lieut Victor Groom, Lieut. Thomas Gordon.

Lieut. Leslie Hamilton, Lieut. Herbert Hampton, Lieut. Ernest Hardcastle, Lieut. Norman Harben, Lieut Geoffrey Hett, Lieut George Hicks, Lieut. Sydney Highwood, Lieut. George Hobson, Lieut. John Holland, Lieut. John Hoogterp, Lieut. Gordon Hyams.

Lieut. Arthur Jarvis, Lieut Lawrence Jessop, Lieut. William Jones.

Lieut. Frank Loly, Lieut. Harry Longbottom.

Lieut. Eric MacDonald, Lieut. John MacLennan, Capt. Charles Maud, Lieut. Matthew McConville, Lieut. John McDonald, Lieut. Robert McLaughlin, Lieut. William Miller.

Lieut. Wilfred Nuttall.

Lieut. James O'Connell, Lieut. Harry Oldham.

Lieut. William Palk, Lieut. Cyril Parry, Lieut. Lawrence Pendred.

Capt. Alexander Rankin, Lieut. Norman Roberts, Lieut. Thomas Rose, Lieut. Horace Russell.

Lieut. Harold Searson, Lieut. Richard Shaw

Lieut. Charles Sims, Lieut. Arthur Stevenson

Lieut. Louis Packenham-Walsh.

Sec. Lieut. Gordon Ballantyne, Sec. Lieut. Alfred Barter, Sec. Lieut. John Blandford, Sec. Lieut. Percy Boulton.

Sec. Lieut. Reginald Creamer.

Sec. Lieut. Edward Dew.

Sec. Lieut. Gower Elias.

Sec. Lieut. James Gascoyne, Sec Lieut Robert Gordon.

Sec. Lieut. Charles Haigh, Sec. Lieut. Thomas Harries, Sec. Lieut. George Hart.

Lieut. Robert Jamison.

Lieut. James McDonald, Sec. Lieut. Conrad Moth.

Sec. Lieut. William Owens.

Sec. Lieut. William Patey, Sec. Lieut Harley Phillips, Sec. Lieut Hartley Pullan

Lieut. Hervey Rhodes, Sec Lieut. Albert Robinson.

Sec. Lieut. Godfrey Sellers, and Sec. Lieut. Edward Simpson

THE AIR FORCE CROSS.—Major-Gen. Sir William Brancker, Col. Arthur Bigsworth, Major Philip Babington, Lieut.-Col. Henry Busteed, Lieut.-Col. John Fletcher, Lieut.-Col. Francis McClean.

Major William Acland.

Major Reginald Carr, Major Robert Chalmers, Major the Hon. Roger Coke, Major John Coleman, Major Geoffrey Cox.

Major Horace Dean.

Capt. Thomas Elmhurst.

Major Charles Freeman.

Major Frank Garratt.

Major Arthur Harris, Major Roderick Hill

Capt. Montague Jennings.

Capt. Harold Kerby.

Capt. Ivo Little.

Capt. Forster Maynard, Major Geoffrey Mitchell.

Capt. John Orton.

Major Humphrey Raikes.

Capt. Douglas Stewart.

Capt. Robert Aitken, Lieut. William Algie.

Capt. Gilbert Barrett, Capt. Seymour Benson, Capt. Godfrey Bremridge, Lieut. Paul Bulman.

Capt. Edgar Carpenter, Lieut. Henry Clarke, Capt. Brian Clayton, Capt. Ralph Cochrane, Major Arthur Cooper, Capt. Roger Corfield.

Capt. Charles Dalison, Lieut. Desmond De Burgh, Capt Archibald Dickie, Lieut. Noel Dixon.

Capt. Joseph Fall, Capt. Albert Fanstone, Capt. Matthew Frew.

Capt. Edward Galley, Capt. Charles Geach, Capt. Percy Gethin, Major Albert Godfrey, Major Samuel Greer

Capt. Stafford Harris, Capt. Henry Horsfield.

Capt. Ignatius Kelly, Capt. Walter Kemp, Capt. James Kerr.

Capt. John Leach, Capt. Prilip Le Gallas.

Capt. Percy Maitland, Capt Duncan McGregor, Capt. George Meager, Capt. Edward Morgan, Capt. Francis Musson

Capt. Malcolm Nares, Capt. William Nicholson, Capt. Jack Noakes.

Capt. Henry Owen.

Lieut. Albert Peace.

Capt. Cecil Rea, Capt. Alan Riley, Capt. Frank Rose.

Capt. Robert Saundby, Capt. Charles Stocks, Capt. Ronald Sugden.

Lieut. Cyril Adamson, Lieut. Alfred Alexander.

Lieut. the Hon. Alan Boyle, Lieut. Robert Burrows.

Lieut. Morris Carver, Lieut. Charles Channing, Lieut. Leslie Chivers, Lieut. Stanley Cowell.

Lieut. Stanley Dreschfeld.

Lieut. Reignald Edwards, Lieut. Hugh Francis.

Lieut. Harold Game, Lieut. Ernest Garner

Capt. Edward Haigh, Lieut. Henry Hamer, Lieut. Robert Hartley.

Capt. Archibald Lutyens.

Lieut. Gilbert Martingell, Lieut. Mervyn Mossop

Lieut. William Oulton, Capt John Oliver

Lieut. Francis Pelly, Lieut. George Powell.

Lieut. William Rope, Lieut. Wilfred Rutledge

Lieut. Leonard Brown.

Sec. Lieut. Edward Hail.

Lieut. Arthur Power, and

Sec. Lieut. Bertram Scovell

BUCKINGHAM PALACE, July 31st.

The King held an Investiture in the Quadrangle of the Palace at 11 o'clock this morning.

The following were severally introduced into the presence of His Majesty, when The King invested them with the Insignia of the respective Divisions of the Orders into which they have been admitted:—

THE DISTINGUISHED SERVICE ORDER.—Lieut.-Col Richard Williams, Aust. F.C. (also received the Insignia of an Officer of the Most Excellent Order of the British Empire, Military Division).

THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE.—Officer.—Military Division.—Mary, Mrs. Edwards, W.R.A.F., Winifred, Mrs. Powell, W.R.A.F., Lieut.-Col. Charles Edmonds, R.A.F., Lieut.-Col. John Hawkins, R.A.F., Major Arthur Struben, R.A.F., Major John Thornely, R.A.F., and Capt. William Budgen, R.A.F.

MEMBERS.—Military Division.—Capt. David Manwell, Aust. F.C., Lieut. Percival McBain, Aust. F.C., Capt. Arthur Allen, late R.A.F., Capt. Henry Smith, R.A.F., and Lieut. John Clift, R.A.F.

His Majesty then conferred decorations as follows.—

THE DISTINGUISHED SERVICE CROSS.—Capt. Guy Smith, R.A.F

THE MILITARY CROSS.—Lieut. William Warden, R.A.F.

Mrs. Horn had the honour of being received by the King, when His Majesty handed to her as "Next-of-Kin" the Albert Medal awarded to her husband, the late Driver Alfred Horn, Royal Army Service Corps, under the following circumstances:—

On June 30th, 1918, a Corporal of the Royal Air Force, who had been lowered by a rope into a crater caused by a bomb which had been dropped by a hostile aeroplane, was overcome by carbon monoxide gas, which had accumulated in large quantities in the crater. Endeavours were made to haul him out, but his head became caught, and Private Johnson volunteered to descend and readjust the rope, which he did successfully, and the Corporal was rescued, but Johnson was himself overcome. Driver Horn at once put on his respirator and lowered himself to the rescue, but was likewise overcome. Sergeant Brooks then volunteered to attempt to rescue both men, but was also overcome by the gas; fortunately, he was hauled out. At this stage Brigadier-General Burt refused to permit anyone else to descend, but did so himself, and succeeded in dragging one of the unconscious men some way towards the rope; he, however, became unconscious, and had to be pulled out. There can be no doubt that all knew the risk they were running, and willingly incurred it in the hope of saving life.

BUCKINGHAM PALACE, August 2nd.

The King held an Investiture in the Quadrangle of the Palace at 11 o'clock this morning.

The following were severally introduced into the presence of The King, when His Majesty invested them with the Insignia of the respective Divisions of the Orders into which they have been admitted:—

THE MOST HONOURABLE ORDER OF THE BATH.—Companion.—Military Division.—Brigadier-General Francis Festing, R.A.F.

THE MOST DISTINGUISHED ORDER OF SAINT MICHAEL AND SAINT GEORGE.—Companions.—Colonel Frederick Halahan, R.A.F.; Colonel Charles Samson, R.A.F. (also received the Air Force Cross); Lieut.-Colonel Ulick Bourke, R.A.F.; Lieut.-Colonel Robert Bradley, R.A.F.; Lieut.-Colonel Albert Fletcher, R.A.F.; Lieut.-Colonel Cecil Fraser, R.A.F. (also received the Insignia of an Officer of the Most Excellent Order of the British Empire, Military Division); Lieut.-Colonel Thomas Higgins, R.A.F.

THE MOST EXCELLENT ORDER OF THE BRITISH EMPIRE.—Officer.—Military Division.—Major Geoffrey Read, late R.A.F.

The King then conferred decorations as follows:—

THE MILITARY CROSS AND BAR AND THE DISTINGUISHED FLYING CROSS.—Capt. David Stewart, R.A.F.

THE MILITARY CROSS AND BAR AND THE AIR FORCE CROSS.—Major Walter Scott, R.A.F.

THE MILITARY CROSS AND THE DISTINGUISHED FLYING CROSS.—Lieut.-Colonel Harold Blackburn, R.A.F., and Capt Norman MacMillan, R.A.F.

THE MILITARY CROSS AND THE AIR FORCE CROSS.—Major Oliver Stewart, R.A.F.

THE MILITARY CROSS.—Capt. Harold Hamersley, R.A.F., Capt Gilbert McPherson, R.A.F.; Capt. Kenneth Montgomery, R.A.F.; Lieut. Croker Barrington, R.A.F.; Lieut. Eric Birkbeck (North Staffordshire R., attd. R.A.F.).

THE DISTINGUISHED FLYING CROSS.—Major George Sansom, R.A.F.; Capt. Claver Bessett, R.A.F.; Capt. Clarence Williamson-Jones, Capt. Geoffrey Siedle, R.A.F.; Captain Charles Snow, R.A.F.; Captain Walter Southey, R.A.F.; Captain Richard Stephenson, R.A.F.; Capt. John Storey, R.A.F.; Capt. Theodore Studd, R.A.F.; Capt. John Todd, R.A.F.; Capt. Godfrey Thomas, R.A.F.; Capt. Stanley Turner, R.A.F.; Capt. Charles Veitch, R.A.F.; Capt. James Walker, R.A.F.; Capt. John Walmsley, R.A.F.; Capt Leslie Warren, R.A.F.; Capt. Joseph White, R.A.F.; Capt. Arthur Williams, R.A.F.; Capt. Robert Williams, R.A.F.; Capt. Archibald Yuille, R.A.F.; Lieut. Harold St. John, R.A.F.; Lieut. John Shearer, R.A.F.; Lieut. Denys Stuart-Shepherd, R.A.F.; Lieutenant William Sidebottom, R.A.F.; Lieutenant Harold Skinner, R.A.F.; Lieutenant Harold Smith, R.A.F.; Lieut. William Staton, R.A.F.; Lieut. Stephen Stafford, R.A.F.; Lieut. John Stronach, R.A.F.; Lieut. Hedworth Tait, R.A.F.; Lieut. Bryant Taylor, R.A.F.; Lieut. George Thomson, R.A.F.; Lieut. Joseph Todd, R.A.F.; Lieut. Edward Unmack, R.A.F.; Lieut. Christoffel Venter, R.A.F.; Lieut. William Walker, R.A.F.; Lieut. Wilfred Ward, R.A.F.; Lieut. Edward Weakly, R.A.F.; Lieut. David Weston, R.A.F.; Lieut. Clifford White, R.A.F.; Lieut Basil Wilcox, R.A.F.; Lieut. Frederick Williams, R.A.F.; Lieut. Eric Willis, R.A.F.; Lieut. Basil Worthington, R.A.F.; Sec. Lieut Alfred Tutte, R.A.F.; and Sec. Lieut. John Young, R.A.F

THE AIR FORCE CROSS.—Lieut.-Colonel Harold Watkins, R.A.F.; Lieut.-Colonel Hugh Williamson, R.A.F.; Major Frederick Sandford, R.A.F.; Major Frederick Sowrey, R.A.F.; Major John Sowrey, R.A.F.; Major William Sowrey, R.A.F.; Major Benjamin Travers, R.A.F.; Capt Trevor

Salt, R.A.F.; Captain Victor Scriven, R.A.F.; Captain Duncan Stewart, R.A.F.; Captain Charles Sturt, R.A.F.; Captain Robert Tailyour, R.A.F.; Captain William Tait, R.A.F.; Captain Alfred Taylor, R.A.F.; Captain Malcolm Taylor, R.A.F.; Captain George Thom, R.A.F.; Capt Cyril Truran, R.A.F.; Capt. George Turnbull, R.A.F.; Capt. Creswell Turner, R.A.F.; Capt. Stanley Vincent, R.A.F.; Capt. Robert Usher, R.A.F.; Capt. Frederick Walker, R.A.F.; Capt. Lloyd Whitworth, R.A.F.; Capt. Percival Wickens, R.A.F.; Capt. Clifford Wilcock, R.A.F.; Capt. Thomas Williams, R.A.F.; Capt. James Wilson, R.A.F.; Capt. Frank Woods, R.A.F.; Capt. Felix Wollard, R.A.F.; Capt. James Wright, R.A.F.; Lieut. John Hirst, R.A.F.; Lieut. Frederick Shepard, R.A.F.; Lieut. Francis Smith, R.A.F.; Lieut. William Taylor, R.A.F.; Lieut. Collingwood Thompson, R.A.F.; Lieut. Algernon Townend, R.A.F.; Lieut. John Tratman, R.A.F.; Lieut. Harold Ward, R.A.F., Lieut. Weldon Watts, R.A.F.; Lieut. Francis Way, R.A.F.; Lieut. William Westcott, R.A.F.; Lieut. Stephen Wilkinson, R.A.F.; Lieut. James Williamson, R.A.F.; Lieut. Arthur Wray, R.A.F., and Sec. Lieut Cowan Stephenson, R.A.F

The following had the honour of being received by His Majesty, when The King handed to her, as "Next-of-Kin," the decoration won by her husband in the War :—

THE ALBERT MEDAL.—Mrs. Johnson. Awarded to her husband, the late Private Arthur Johnson, R.A.S.C.

On June 30th, 1918, a Corporal of the Royal Air Force, who had been lowered by a rope into a crater caused by a bomb which had been dropped by a hostile aeroplane, was overcome by carbon monoxide gas, which had accumulated in large quantities in the crater. Endeavours were made to haul him out, but his head became caught, and Private Johnson volunteered to descend and readjust the rope, which he did successfully, and the Corporal was rescued, but Johnson was himself overcome. Driver Horn at once put on his respirator and lowered himself to the rescue, but was likewise overcome. Sergeant Brooks then volunteered to attempt to rescue both men, but was also overcome by gas; fortunately, he was hauled out. At this stage Brigadier-General Burt refused to permit anyone else to descend, but did so himself, and succeeded in dragging one of the unconscious men some way towards the rope; he, however, became unconscious and had to be pulled out. There can be no doubt that all knew the risk that they were running, and willingly incurred it in the hope of saving life.

NAVAL.

ADMIRALTY, July 25th.

Ch. Art. Eng. to be Eng. Lt. (Capt., R.A.F.) :—F. H. Williams, Jan. 18th.

* * *

The following concerning the recent visit of H.M.A. R. 34 to Germany is from the Danish correspondent of THE AEROPLANE :—

The flight of R.34, which was visible over most parts of Denmark, acted quite as a stimulant, being especially spectacular at Copenhagen, where the airship stopped over the British Fleet at the harbour and lowered a cable, whereupon the commanders communicated by 'phone for some time on the observations made by the airship in crossing the German North Sea and Baltic coasts.

* * *

On July 30th H.M.A. R.34 left the Naval Airship Station at Pulham, Norfolk, for the station at East Fortune, Scotland, and on her way to the latter place contrived to pay a visit to London. The ship arrived about 7 p.m. and voyaged about overhead for some little time. R.34 has been undergoing overhaul at Pulham since her arrival there after her Atlantic flight.

R.34 arrived at East Fortune at 6.5 a.m. on July 31st.

* * *

On July 28th the British Naval F.5 flying-boat N.4044 (Major Galpin in command), left Christiania for Copenhagen at 11 a.m.

Up to this point all accounts agree, but after that, there is a pleasing variety in the wording of them. Some say that the flying-boat arrived at Copenhagen at 2.25 p.m. the same day, and others that she arrived at 2.25 p.m. the following day, one of her engines having broken down en route.

Had it been war-time, one would have felt inclined to suggest that she had descended on her way to "confer about targets," which would have explained the discrepancy in the two statements.

* * *

At an inquest at Cromer on July 31st on the body of Serjt. Charles H. Lewry, R.A.F., of Gosport, no fresh evidence was forthcoming as to the cause of the accident to H.M.A. "N.S.11."

An officer of the R.A.F. said all that was known officially was that the cause was fire, the origin of which was a mystery. Lewry was second coxswain. He was believed to be steering the airship when the fire occurred. If he were he would be in the forepart of the car, and it was possible that the latter was broken when it reached the water and released his body, as well as two seats which would be near him for the use of the pilot, and were found among the wreckage washed up. It was probable that the body of the car broke down by the two heavy engines sinking with the remainder of the crew imprisoned inside

A witness from the Pulham Aerodrome said when the airship "N.S.3" was lost in the sea some time ago five of the crew were rescued. They were able to escape from the car on to the floating envelope, but in that case there was no fire such as occurred in the wreck of the "N.S.11."

The Coroner recorded a verdict of "Found dead on the beach after being washed ashore from the wrecked airship."

* * *

It is understood that the big triplane flying-boat, known as the "Felixstowe Fury," designed by Lieut.-Col. J. C. Porte, C.M.G., R.A.F., will shortly fly to Egypt. The newspaper, Nationaltidende," of Copenhagen, states that Capt. Scott, R.A.F., the pilot of F.5, 4044, at present at Copenhagen, will make one of the crew.

* * *

The War Office announces that the British War Medal Riband may now be worn by all ranks who are entitled to the award of the medal, and that in each case a preliminary issue of two inches of the riband will be made.

Soldiers discharged from the Royal Flying Corps before April 1st, 1918, should apply to the Royal Air Force Record Office at Blandford on the official postcard (F.S. Form 758), obtainable at any post office.

* * *

A message from Peshawar giving further details of the fighting in the Khyber on July 18th says :—

After the Afridis had captured a hill overlooking Fort Maude, and while we were still shelling it preparatory to a counter-attack, they sent by helio a Hindustani message reading: "This is to show you what we can do. Now we are going to retire."

They then retired to Fort Chora, in the Bazar Valley, but there were caught by an aeroplane sent to bomb the fort, and it is believed that 50 Afridis were killed by a single bomb.

* * *

It is stated from that somewhat unreliable source a newspaper, and a Russian one at that, that British aeroplanes bombed the forts at Kronstadt on July 28th. Heavy smoke was seen coming from the forts but no explosion was heard. The forts fired upon the aircraft.

AIR FORCE.

NOTE.—The "Acting Ranks" indicated against names in this "Gazette" have been relinquished in the great majority of cases since the commencement of the printing, and in many cases the Officers and other ranks have been demobilised.

CORRECTIONS.

The following are the correct descriptions of Officers whose names appeared in the "Gazettes" indicated in connection with the grant of decorations or Mentions in Dispatches :—

Lt.-Col. Sir H. Fowler, K.B.E. ("Gazette" No. 31297, April 15th); Maj. W. D. Long, O.B.E. ("Gazette" No. 31098, Jan. 1st), Capt. L. E. Lander, M.B.E. ("Gazette" No. 31098, Jan. 1st); Capt. J. H. Cooke, M.B.E., M.B. (R.A.M.C., Egypt) ("Gazette No. 31098, Jan. 1st); Lt.-Col. N. J. Roche, O.B.E. ("Gazette" No. 31378, June 3rd); Sec. Lt. (actg. Maj.) A. R. Fulton, M.B.E. ("Gazette" No. 31378, June 3rd); Capt. W. Hayward, M.B.E., No. 4 Group ("Gazette" 31378 June 3rd); Capt. (actg. Maj.) P. P. C. Penberthy (Shrops. L.I.). This officer's name appeared in the list of awards of the fifth grade of the Military Division, British Empire Order, in the "London Gazette," June 3rd (No. 31378), instead of in the list of appointments to the fourth grade (O.B.E.), and the correction is hereby authorised. Lt.-Col. W. S. Fetherstonhaugh (Can For. Corps, attd. R.A.F.) (France). The announcement of the award of the 4th grade, British Empire Order, in "Gazette" No. 31378 of June 3rd, is cancelled, this Officer having been awarded a higher grade. Col. the Rev. R. V. Hanson, O.B.E. (Dep. Chapl.-in-Chief, R.A.F.). The announcement published in "Gazette" No. 31378 June 3rd (award of O.B.E.) is cancelled, this award having been also published in "Gazette" No. 31377 of same date. Lt.-C. W. Seymour-Hall (mentioned in Dispatches, "Gazette" No. 31378, June 3rd); 91075 Serjt.-Obsr. L. H. Rowe, D.F.M. ("Gazette" No. 31378, June 3rd); Lt. (actg. Capt.) G. B. Irving, D.F.C. (19th Squadron, R.A.F., attd. 10th (Army) Wing) (France) (D.F. Cross gazetted Aug. 3rd, 1918) (deceased)

Capt. C. B. Belt, M.B.E., M.C., D.C.M. (S. Staff R.) ("Gazette" 31378, June 3rd); Deputy Adm. Mrs. F. Day, M.B.E. (W.R.A.F.) ("Gazette" 31378, June 3rd); Maj. (actg. Lt.-Col.) A. Levick, O.B.E. (former service in C. Gds.) ("Gazette" 31378, June 3rd); Capt. W. J. Cooper, M.B.E. (Aust. Flying Corps, Recording Offr.) (France) ("Gazette" 31378, June 3rd); Lt. P. A. McBain, M.B.E. (Aust. F. Corps) (Palestine) ("Gazette" 31378, June 3rd); Lt. (actg. Capt.) D. W. Grinnell-Milne, D.F.C. (R. Fus.) (56th Squadron) (France) ("Gazette" 31378, June 3rd, Bar to D.F. Cross); No. 8398 Serjt.-Maj. G. Gilman (53rd Squadron) (France) (the announcement of award of Meritorious Service Medal in "Gazette" No. 31008, Jan. 1st, is cancelled, this award having been already published in "Gazette" No. 30722, June 3rd, 1918); No. Aus./124 Flt. Clk. J. H. Rogers (Aust. F. Corps) awarded the Meritorious Service Medal in "Gazette" No. 30624, April 11th, 1918, for services in connection with the capture of Jerusalem; the second announcement of this reward, which appeared in "Gazette" No 31358, June 3rd, is accordingly cancelled; Maj. H. G. Atkinson, O.B.E., R.A.F., awarded the O.B.E., in "Gazette" No. 31000, Jan. 1st; the second announcement in "Gazette" No. 31098 of the same date is accordingly cancelled.

(To be continued.)

PAY IN THE ROYAL AIR FORCE FOR WARRANT OFFICERS, NON-COMMISSIONED OFFICERS AND AIRMEN OF THE ROYAL AIR FORCE.

1. The rates of pay and pension for the ranks of the Royal Air Force below commissioned rank have been under review and the standard rates now authorised are as shown in the accompanying statements.

2. The rates of pay will come into force on the 1st August, for all men not dispensed before that date, in substitution for existing rates and bonus, but in any case where the present rates of pay together with Army of Occupation bonus are more beneficial than the new standard rates a vested right to the old rates will be allowed as follows:—

(a) Men on regular engagements may draw their present rates plus bonus, if more beneficial than the new rates, up to the 31st March, 1920. This will include men now serving who may without a breach in their service, re-engage or sign regular engagements.

(b) *New enlistments.*

All men enlisting on or after 1st August, 1919, whether with previous service or not, will come on the new rates of pay forthwith.

(c) *Men serving for Occupation Period.*

These men, if not on regular engagements, retain the old rates plus bonus until discharge, if more favourable.

3. Rates of pay for the Medical and Schoolmaster Branches will be subsequently announced.

4. Badges for good conduct will be granted, under regulations to be promulgated, after 3, 8 and 13 years' service. Each badge will carry pay of 3d. a day up to a maximum of 9d.

5. The present rates of separation allowance will be continued under existing conditions as to entitlement until 31st December, 1919, when the rates and conditions of issue will be again reviewed. This will not, of course, affect the position of men serving for the Period of Occupation or those who have extended their service for 2, 3, or 4 years with reserved rights to this allowance.

6. A further announcement will be made as to allowance (other than separation allowance).

7. Further details as to rates and the conditions of their issue will be published in Regulations in due course.

ROYAL AIR FORCE (OTHER RANKS).

The rates of pay proposed are as follows:—

TECHNICAL.—GROUP I.

Sergeant-Major, Class I., 14s. rising by 1s. a day a year to 18s.

	s. d.	Over 3 years. s. d.	Over 6 years. s. d.
Sergeant-Major, Class II. ...	13 0		
Flight-Sergeant	11 6	12 0	12 6
Sergeant	9 6	10 0	10 6
Corporal	7 9	8 0	8 6
Leading Aircraftman	5 6	5 10	6 2
Aircraftman I.	4 6	4 10	
Aircraftman II.	4 0		
Boy	1 6		

Applicable to the following trades and occupations:—
Blacksmith.
Carpenter (boat builder).
Carpenter (motor body builder).
Carpenter (propeller maker).
Carpenter (rigger).
Coppersmith (1).
Draughtsman (normally boys only).
Electricians (compass setter and repairer).
Fitters and subsidiary combined trades.
Fitter (aero engine).
Fitter (general).
Fitter (M.T.).
Fitter (constructional).
Fitter (drivers: petrol, steam).
Fitter (motor boat).
Fitter (armourers).
Fitter (motor boat coxswain)).
Fitter (millwright).
Fitter (jig and tool maker).
Instrument maker and camera repairer.
Moulders.
Pattern maker.
Turner (2).
Wireless operator (mechanic).

(1) Not to be promoted beyond Sergeant unless qualified as both Coppersmith and Tinsmith.

(2) Not to be promoted beyond the rank of Flight-Sergeant unless qualified both as Machinist and Turner.

All boys (trained in the Service) will be advanced to leading aircraftsman on satisfactory completion of training.

TECHNICAL.—GROUP II.

Sergeant-Major, Class I., 12s. 6d., rising by 6d. a day a year to 15s.

	s. d.	Over 3 years. s. d.	Over 6 years. s. d.
Sergeant-Major, Class II. ...	11 6		
Flight-Sergeant	10 0	10 6	11 0
Sergeant	8 6	9 0	9 6
Corporal	6 8	7 0	7 4
Leading Aircraftman	5 2	5 6	5 10
Aircraftman I.	4 6	4 9	
Aircraftman II.	3 9		
Boy	1 6		

Applicable to the following trades and occupations:—
Acetylene welder.
Balloon basket maker.
Camera repairer.
Electrician.
Machinist.
Carpenter.
Coach painter.
Photographer
Rigger (aero).
Rigger (airship).
Sheet metal worker.
Tinsmith.
Wireless operator.

TECHNICAL.—GROUP III.

Sergeant-Major, Class I., 11s. rising by 6d. a day a year to 15s.

	s. d.	Over 3 years. s. d.	Over 6 years s. d.
Sergeant-Major, Class II. ...	10 0		
Flight-Sergeant	8 6	9 0	9 6
Sergeant	7 0	7 6	8 0
Corporal	5 10	6 2	6 6
Leading Aircraftman	4 6	4 10	5 2
Aircraftman I.	4 0	4 4	
Aircraftman II.	3 6		
Boy	1 6		

Applicable to the following trades and occupations:—
Driver (Petrol) (3).
Motor-boat coxswain.
Driver (steam).
Driver (winch).
Motor cyclist (1).
Cook and butcher.
Shoemaker (so long as present conditions of free repair continue).
Tailor (so long as present conditions of free repair continue)
Musician (permanent bands only)
Hydrogen worker.
Vulcaniser.
Motor-boat crew (2).
Stoker (not to be promoted beyond Corporal).
Fabric worker.
Upholsterer.

(1) Not to be promoted beyond Corporal unless qualified as driver (M.T.).

(2) See under Non-substantive Pay, etc., as to hard lying money.

(3) Not to be promoted beyond Sergeant unless qualified as fitter.

ADMINISTRATIVE.—GROUP IV.

Sergeant-Major, Class I., 11s. by 6d. a day a year to 15s.

	s. d.	Over 3 years. s. d.	Over 6 years. s. d.
Sergeant-Major, Class II.....	10 0	9 0	9 6
Flight-Sergeant	8 6	7 6	8 0
Sergeant	7 0	6 2	6 6
Corporal	5 10	4 10	5 2
Leading Aircraftman	4 6	4 4	
Aircraftman I.	4 0		
Aircraftman II.	3 6		
Boy	1 6		

Applicable to the following occupations:—
Clerk (general).
Clerk (pay).
Clerk (stores).
Clerk (Q).
Meteorologist.

NON-TECHNICAL.—GROUP V.

	s. d.	Over 3 years. s. d.	Over 6 years. s. d.
Sergeant-Major, Class I.	10 0		
Sergeant-Major, Class II. ...	9 0		
Flight-Sergeant	8 0	8 6	9 0
Sergeant	6 6	7 0	7 6
Corporal	5 0	5 4	5 8
Leading Aircraftman	4 0	4 4	4 8
Aircraftman I.	3 4	3 8	
Aircraftman II.	3 0		
Boy	1 6		

Applicable to the following trades and occupations:—
Aircraft hand (batman, G., P.T.I., G.I.).

See under "Non-substantive pay," etc., as to addition to substantive pay for the performance of specific duties.

NON-SUBSTANTIVE RATES OF PAY, ETC.

Gunnery Instructor.—1s.
Physical Training Instructor, 1st Class.—1s
Physical Training Instructor, 2nd Class.—8d.
Aerial Gunner.—6d.
Interpreter.—Naval rates (1s. per hour with a maximum of 5s. a day; days of employment only).
Schoolmaster (to men not of Schoolmaster Branch).—3d.; days of employment only.
Crew pay.—Coxswain, 4s.; other members of crew 2s. a day continuously whilst borne on the establishment of a squadron for service in aircraft.
Hard lying money.—To be paid at Naval rates and under Naval conditions to the Marine Branch of Royal Air Force.
In addition to crew pay of 2s. per day whilst employed on the authorised establishment of a squadron.

GOOD CONDUCT PAY.

As for the Army.

PENSIONS.

1. The minimum qualifying period will be 24 years from the date of attestation at the age of 16½ years.

2. The numbers allowed from time to time to re-engage for pension will be determined by the requirements of the Service and will in any case be restricted to men who have reach N.C.O. rank.

3. The pension will be granted on the basis of a daily rate for each complete year of service in each rank, with proportionate amounts for completed months. The daily rate will be uniform for all branches.

The daily rate for ranks other than Warrant Officers is as follows:—
Aircraftman, 1½d

Corporal, 2d.
Sergeant, 2½d.
Flight-Sergeant, 3d.

4. WARRANT OFFICERS.—The scale for warrant officers will remain as at present, namely :—
For each completed year prior to warrant rank—£3.
For each year as warrant officer :—
(a) If retired as warrant officer, Class II.—£4.
(b) If retired as warrant officer, Class I.—£5.
The above scale is subject to maximum rates as follows :—
Warrant officers, Class II.—£120.
Warrant officers, Class I.—£150

5. All men discharged to pension will thereupon become members of the R.A.F. Reserve.

6. If after 24 years' service a man continue to serve, he will draw the pay of his rank and his time will count for increased pension

7. COMMUTATION.—Commutation of pension will be allowed *where it would be a distinct and permanent advantage to the pensioner*, always provided that a minimum of 2s. a day is left uncommuted.

THE NEW RANK TITLES IN THE R.A.F.

The Secretary of the Air Ministry made the following announcement on August 4th :—

His Majesty the King has been pleased to assume the title of Chief of the Royal Air Force.

His Majesty, on the advice of the Secretary of State for War and Air, has approved of new titles for the commissioned ranks of the Royal Air Force. These are set out below with their corresponding ranks in the Army and the Navy :—

Air Force	Navy	Army
Marshal of the Air	Admiral of the Fleet	Field-Marshal
Air Chief-Marshal	Admiral	General
Air Marshal	Vice-Admiral	Lieut.-General
Air Vice-Marshal	Rear-Admiral	Major-General
Air Commodore	Commodore	Brig.-General
Group Captain	Captain	Colonel
Wing Commander	Commander	Lieut.-Colonel
Squadron Leader	Lieut.-Commander	Major
Flight Lieutenant	Lieutenant	Captain
Flying Officer (or Observer)	Sub-Lieutenant	Lieutenant
Pilot Officer	Midshipman	Sec. Lieutenant

The object which has been held in view is to preserve and emphasise the principle of the independence and integrity of the Royal Air Force as a separate Service among the fighting Services of the Crown. Hitherto the titles borne by officers of the Royal Air Force have been exclusively military in character, and as such they are not suited to a Service which has not only to serve the special services of the Army, but also those of the Navy, and in addition has a strategic and tactical sphere of action independent of the other two fighting Services.

It is, of course, not easy to command unanimous agreement on matters of nomenclature, but very long and careful consideration has been given to the choice of the titles now approved and many interesting alternative suggestions have been rejected.

The scheme is framed on the principle (a) that the ranks should as far as possible correspond to actual functions; (b) that the ranks should as far as possible correspond to equivalent status in the three Services; and (c) that there should be no repetitions in titles apart from the prefixes in the higher ranks. A distinction is preserved between the regimental officers and officers of General rank. Officers of General rank in the Royal Air Force are "Air Officers," and the expression "Air Officer" corresponds to the expression "General Officer" in the Army or "Flag Officer" in the Navy.

The new titles will come into force on Monday, August 4th.

A ROYAL AIR FORCE CADET COLLEGE.

The Air Ministry makes the following announcement :—

1. A Royal Air Force Cadet College for the training of the permanently commissioned officers of the Royal Air Force will be opened in February next.

The number of Cadets to be admitted on the opening of the College will be 55. Admission will be by competitive examination.

The examination for admission will be held by the Civil Service Commissioners, and will be the examination now in force for admission to the Royal Military Academy, Royal Military College, and Cadetships in the Royal Navy. (Special entry.)

2. Candidates may compete for one or more of the above colleges and cadetships alternatively at the same examination. The subjects in the case of the R.A.F. Cadet College will be as follows :—

OBLIGATORY.—1. English; 2. English History and Geography; 3. Mathematics A (elementary); 4. One of the following languages —French, German, Italian, Spanish, Russian, Arabic, Hindustani.

OPTIONAL.—1. Latin; 2. Greek; 3. Any one of the seven languages mentioned above other than that taken as an obligatory subject; 4. Mathematics B (intermediate); 5. Mathematics C (higher); 6. Science (Physics and Chemistry); 7. Elementary engineering.

All obligatory subjects must be taken up and not more than three of the optional subjects. Each subject will carry 2,000 marks.

In addition candidates may take up freehand drawing, to which 400 marks will be allotted.

The syllabus in each subject will be that now in force for the other Colleges and cadetships mentioned above. Candidates will be required to qualify, i.e., to obtain not less than 33 per cent. of the total marks alloted in each of the obligatory subjects.

Provided a candidate qualifies, the total of marks gained in all the subjects taken up will determine his place on the list.

The examination will be held in November.

3. Candidates must have attained the age of 17½ and must not have attained the age of 19 on January 1st, 1920, to be eligible to compete.

4. Candidates will be required to pass a medical examination which will be conducted at or about the time of the competitive examination.

5. The course at the College will last two years. During the second year of the course Cadets will be taught to fly.

6. The Regulations governing the entry of King's Cadets, Honorary King's Cadets, and candidates specially nominated by the Air Council will be similar to those now in force in the case of the Royal Military Academy and the Royal Military College.

7. Detailed regulations for admission and for the course at the College will be issued shortly, and will include full information as regards fees and allowances.

8. The Air Council has fully considered the alternative of admission by nomination combined with a qualifying literary examination, but has decided to adopt for the present the system now in force for the entry of Cadets to the Royal Military and Royal Military College in order to secure an early entry and to make the training of the future officers of the Royal Air Force to commence at the earliest possible moment. This decision does not prejudice future modifications in the system of entry designed to substitute nomination for a competitive examination, should experience show such a course to be desirable.

* * *

Recruiting is being started by the Royal Air Force to obtain 15,000 men, of whom 12,000 are required to be skilled workmen. Ex-Service men who have served in the Air Services are especially wanted. Men between the ages of 18 and 26 are eligible, but men will be accepted over 26 if they are skilled. The term of service is four years.

GERMANY.

The Berlin "Post" publishes a letter which Herr Erzberger sent in September, 1914, to General von Falkenhayn, who was at that time War Minister. The latter recommends a flame-thrower, which Herr Erzberger thought might be used successfully from airships against England, and saying that in his view all humanitarian considerations and scruples relative to the violation of international law must be entirely set aside.

CZECHO-SLOVAKIA.

The Czecho-Slovak Premier, M. Tusar, has addressed a Note to Bela Kun protesting, among other things, against the bombing of the town of Csaba (near Arad in Old Hungary), and accusing Hungary of violating the neutral zone, and thus failing to observe the Armistice conditions.

RUSSIA.

OFFICIAL COMMUNIQUES (BOLSHEVIK).

JULY 31ST.—In the Gulf of Finland an enemy aeroplane has dropped bombs in the region of Kronstadt.

* * *

It is reported that a number of aeroplanes has arrived at Helsingfors for the Russian North-West Army.

NORWAY.

The following is from the Danish correspondent of THE AEROPLANE :—

From the middle of July to August 20th a number of air manœuvres is taking place over the southern part of Norway, in which 20 Army pilots partake with scouts and patrol aircraft. Beside military manœuvres the Army aeroplanes will carry out long passenger overland flights as trials, before the inauguration of regular air services.

Being the last of the three Scandinavian countries to enter upon aviation activities, Norway leads at present, which fact it owes chiefly to its good connections with England, wherefrom it has during the years of war been successful in drawing equipment, even if not of the very latest active service mounts.

As has been the case, too, in Sweden and Norway, like even the Allied warfaring countries, Henry and Maurice Farman biplanes made the chief composition of both the Army and the Naval Flying Services both before and while expanding early in the war.

The chief naval air station is by the Royal Dock yard in Horten, and other stations are along the coasts of the North Sea and Skager Rak, like Christiansand, while the main Army flying ground is at Lilleström, near Christiania.

The respective Government factories are at each of the two centres, under the command of Captain Dehli (Navy), and Captain Sem-Jacobsen (Army), the same officers commanding formerly the flying services. Colonel Grüner is now chief of the Army Corps.

The Army factory has built both Henry and Maurice Farman Longhorn and "Horace" Farman models, for which the Frederiksstad Mechanical Works produced 130 h.p. Renault motors,

while of advanced types monocoque scouts with snow-skites [*sic*] for winter flying, equipped with 150 h.p. Hispano-Suiza engines, that were fetched early from Spain, and a two-seater patrol biplane of British influenced outlines and powered by a R.A.F. motor, have been produced. B.E. and Avro biplanes have further been acquired in England.

The Navy long stuck to a twin-float Farman type pusher biplane with F.E. tail fin fashion, equipped first with Curtiss motors, and next with some 170 h.p. Sunbeam engines, obtained from England. Various Naval flying officers, like Lieuts. Lützow-Holm and Rüser-Lassen were allowed to undergo a war instruction course at a British Naval flying school, and some 130 h.p. Clerget-engined Sopwith "Baby" seaplanes were acquired.

Nielsen and Winther, in Copenhagen, built a tractor school seaplane for the Norwegian Naval Air Service, equipped with a 100 h.p. Swedish-built Scania-Vabis Mercédès motor.

PERSONAL NOTICES.

NAVAL.

Death.

WHITE.—Major Evelyn Neville Lewis White, R.A.F. (Lieut.-Commander, R.N., retired), who died on July 29th at Trethevy, Tintagel, Cornwall, was the only son of Brig.-General W. L. White, C.B., C.M.G., and Mrs. Lewis White, of 10, Castle Street, Farnham, Surrey. He was 30 years of age.

Engagement.

SMYTH-PIGOTT—FEILDING.—The engagement is announced of Lieut.-Col. Rusconibe Smyth-Pigott, D.S.O., R.A.F. (late R.N.A.S.), youngest son of the late Hugh Cecil Smyth-Pigott and Mrs. Smyth-Pigott, of Brockley Hall, Somerset, and Lady Clare Feilding, daughter of the Earl and Countess of Denbigh.

Marriage.

SHARROD—LANDER.—On July 30th, at the Parish Church, Wellington, Salop, Surgeon-Lieut. Arthur R. Sharrod, R.N., attd. R.A.F., son of the late Mr. F. H. and Mrs. Sharrod, formerly of Cherrington Manor, was married to Gwendoline Lander, younger daughter of Mr. and Mrs. J. V. T. Lander, "Sunnycroft," Wellington.

MILITARY.

Death.

DEVONSHIRE.—Lieut. Feray Vulliamy Devonshire, 7th Hussars, attached R.A.F., who was killed on the Afghan Frontier on July 20th, was the only son of Robert and Henrietta Devonshire, of Heston, Middlesex, and Maadi, near Cairo. He was 28 years of age.

TUCKER.—Sec. Lieut. Donald C. Tucker, R.F.C., who was reported missing on March 24th, 1918, is now officially reported killed in action on that date. He was the youngest son of Frank J. Tucker and Mrs. Tucker, Durley Park House, Keynsham, Somerset, and was 19 years of age.

Engagements.

BLAKE—SHORE.—An engagement is announced between Lieut. George Godfrey Leigh Blake, D.F.C., D.C.M., R.A.F., elder son of the late Rev. G. L. Blake, R.N., and Mrs. Blake, of 19, Redcliffe Square, S.W., and Vera Henrietta Louise, third surviving daughter of Charles R. Shore, Esq., and Mrs. Shore, of Barngates, Binfield, Berks.

LLOYD—MEADOWS.—An engagement has been announced between Captain Hugh Pughe Lloyd, M.C., D.F.C., Croix de Guerre, R.A.F., second son of Mr. and Mrs. L. T. Lloyd, of Alfrick, Worcester, and Kathleen, youngest daughter of Major R. T. Meadows, D.S.O., and Mrs. Meadows, Dunheved, Saltash, Cornwall.

MAUDUIT—BROOKSBANK.—The marriage arranged between Captain R. F. S. Mauduit, M.C., R.A.F., and Irene Helen Brooksbank will take place at Middleton-on-the-Wolds, East Yorkshire, on August 7th, at half-past two o'clock.

MITTON—DE BELABRE.—The engagement is announced of Capt. Mitton, Lincolnshire Regt. and R.A.F., only son of Mr. and Mrs. W. H. Mitton, of Sunnyside, Sleaford, and Daphne Yseult, daughter of Baron de Belabre, French Consul, Newcastle-on-Tyne, and great-granddaughter of Admiral Sir John West, G.C.B.

Marriage.

PORTAL—WELBY.—The marriage took place on July 22nd, at Denton, Grantham, of Major C. F. A. Portal, D.S.O., M.C., R.A.F., son of Mr. E. R. Portal, formerly Master of the Craven Hounds, of Eddington House, Hungerford, and Miss Joan Margaret Welby, third and youngest daughter of Sir Charles Glynne Welby and Lady Maria Welby, of Denton Manor. The service, which was choral, was conducted by the Rev. Lord Manners Hervey, rector of Horringer, Suffolk, and the Rev. B. W. Keymer, O.B.E., R.A.F.

Births.

CORDING.—On July 15th, at 109, Winnock Road, Colchester, wife of Capt. Lewis E. Cording, M.C., M.M., R.A.F., of a son.

DISNEY.—On July 26th, at the residence of her parents, 68, Cadogan Square, S.W., the wife of Major Gervase Disney, Essex Regt. and R.A.F., of a daughter.

PRATT.—On July 20th, at The Meads, Hemingford Abbots, Hunts, to Grace Marian, wife of Capt. G. Brian Pratt, R.A. and R.A.F.—a son.

ROCKINGHAM GILL.—On July 21st, to Christina (*née* Court Treatt) and Captain Rockingham Gill, R.G.A. and R.A.F., a son.

AIR FORCE.

Deaths.

CAIN, GAMMIE, and GRIFFITHS.—An accident occurred on July 18th, at Hendon Aerodrome, in which three aviators lost their lives. Lieut. Cain, R.A.F., accompanied by Corporal Gammie, R.A.F., and Air Mechanic Griffiths, R.A.F., had just ascended in a new machine, which was being taken to another aerodrome, when, in making a turn, it suddenly nose-dived, and on reaching the ground burst into flame.

All three occupants were burned to death before they could be rescued.

At the inquest at Hendon on July 21st, Major Mounsey, R.A.F., identified the bodies, and said that he gave Lieut. Cain permission to ascend. The machine was new, and had just been overhauled.

The Coroner (Dr. Cohen): If the machine was in perfect order, to what do you ascribe the accident.

Witness: To misjudgement of the pilot. The best pilots are liable to make an error of judgment. Lieut. Cain was a fine pilot and had won the Distinguished Flying Cross in Italy.

Corpl. Wright, R.A.F., said that the machine was examined before the flight, when the engine and rigging were found to be in perfect order.

Lieut. F. E. Hills, R.A.F., said that he saw the machine leave the ground. "I next saw them about 150 ft. up. The machine was turning gently, until it nose-dived and fell to the earth. I ran up, but it was too late to give any assistance. The three men were burned to death almost instantaneously."

Lieut. Shaw, of the Aircraft Manufacturing Company, said that he flew the machine three times before handing it over to the Royal Air Force, and it was in perfect order.

The Coroner said that the margin of error in flying was not very great. It was evident that there had been some error of judgment. Errors of judgment in flying, however slight, very often had terrible results.

The jury returned a verdict of "Accidental death."

HERBERT, BIZIOU, and HIELEY.—At the inquest at Farnborough on July 16th a verdict of accidental death was returned on the bodies of Lieutenants Herbert and Biziou and Air Mechanic Charles Hieley, who were killed on July 14th, when an Avro biplane and an S.E.5 collided. The coroner stated that he had dispensed with a jury as he was convinced that prior to the ascent the machines were in perfect flying condition.

Thomas Smith, a workman at Farnborough Court, said he noticed the two machines in the air. One was coming in a north-easterly direction, and the other in a south-easterly.

They were 300 ft. or 400 ft. high, and approached each other in V formation. Both rushed nose to nose on each other, twisted about, and then crashed to the earth, one 200 yards from the other. There was no mist, and he thought that the pilots could have seen each other.

Major Hills, R.A.F., said that the visibility might have been termed poor on that afternoon, but it was not at all dangerous. In France hundreds of machines had worked in the air under much worse conditions.

The Military had already held an inquiry, and were satisfied that the disaster had been entirely accidental. He was convinced that no stunting had taken place.

Engagement.

FRANKISH—WHITEHEAD.—The engagement is announced of Captain J. R. Frankish, M.B.E., R.A.F., eldest son of the late Mr. and Mrs. W. J. Frankish, of Kinnington House, Lincolnshire, and Dorothy Edith, elder daughter of Jeffry Whitehead and Mrs. Whitehead, of Croydon, Surrey.

Marriage.

BROWN—KENNEDY.—On July 28th, at the Chapel Royal, Savoy, Lieut. Sir Arthur Whitten Brown, K.B.E., R.A.F., only son of Mr. and Mrs. A. G. Brown, of Manchester, and Marguerite Kathleen, elder daughter of Major and Mrs. D. H. Kennedy, of Ealing, by the Rev. Hugh Chapman.

Births.

ACLAND.—On July 24th, at 11, Courtfield Gardens, the wife of W. H. D. Acland (late Major, R.A.F.), of Barnes Wood, Welwyn, of a daughter.

KIDDY.—On July 24th, at "Welbeck Lodge," North Finchley, to Dorothy (née Kynoch), wife of Captain M. G. Kiddy, late R.A.F., a daughter.

ON THE BEGINNING OF INTERNATIONAL AVIATION.

SOME IMPRESSIONS FROM AMSTERDAM.

In the days of one's youth one was taught that Holland was the flattest country in the world and that the Hollanders, or Dutch as we wrongly call them, were a great commercial people. It seemed peculiarly apposite then that Holland should have the distinction of being the first country to encourage International commercial flying by holding an exhibition of aircraft as soon as possible after the outbreak of Peace. The Hollanders are a singularly pleasing people with a fund of quiet humour, so they will forgive me for pointing out the irony of the situation in view of the fact that they possess that very beautiful monument of irony, the Palace of Peace at The Hague.

Holland is perfectly flat, so flat that when at the very beginning of the war one suggested bombing Essen from Antwerp by flying over the south-east corner of Holland an Anglo-Dutch friend remarked, "But you cannot do that! You would have to fly over the Dutch Alps. Some of them are as much as thirty metres high!" Yet despite the flatness of Holland it is probably the worst country in the world over which to fly on a land-going aeroplane.

In passing through Holland one sees vast expanses of magnificent grass land, apparently ready-made aerodromes. But as one comes close to them one finds them cut into small rectangular patches by little ditches. In fact, one doubts whether anywhere in western Holland there is a piece of ground 200 yards square without a dyke.

A Hint to Designers.

Here then is the first impression, for the benefit of any constructor who thinks of building big land-going machines for use in the Low Countries. All such machines must be fitted with wide flat skids at least twelve feet long, so that if the machine has to make a forced landing it may be able to slide across the small dykes.

Even a better way would be to make the lower longerons of the machine so that they could act as skids—as in fact the longerons of the F.K.26 B.A.T. are already—and then fit a retractable under-carriage more or less of the Martin type. Then there could be no chance of a machine turning over on its nose or wiping off its under-carriage if forced to land in one of these dyke-infested fields, or in boggy ground. The performance of the Handley Page on its first arrival at Amsterdam was a case in point—but that affair will be described in due course.

The Seaplane's Country.

On the other hand Holland is the ideal country for seaplanes. The pilots who have flown over it from England say that if one flies at 2,000 feet one is always within gliding distance of one of the great canals, and that it would be possible to bring a seaplane down safely on any of them. On many of them a flying-boat of the largest type could alight with perfect ease.

Now the Hollander, like most successful business men, is a man who knows the value of time. His trains are good, but they are not up to aeroplane speed by a good deal, and so it should be possible to do quite good business in Holland with seaplanes. One suggests, therefore, that if an enterprising seaplane firm started a seaplane hire service in Holland it would pay well in time.

Lost Opportunities.

One does not suggest for a moment that a firm has only got to open a shop in Amsterdam and sell seaplanes across the counter, but one does believe firmly that a seaplane "joyride" business would pay its way, and that from it would grow a regular business. First of all it would develop into hiring seaplanes to commercial men, and later this again would develop into a sale-and-maintenance business on quite a big scale.

TO BELIEVERS IN AIRSHIPS.

Those who believe in the future of airships will do well to order at once a copy of THE AEROPLANE for next week (dated Aug. 20th). That issue will be a Special Airship Number and will be devoted to describing the use, construction and design of airships. It will also contain a description and specification of practically every type of airship at present in use in the world.

Great assistance has been given in compiling this Special Number by Vickers, Ltd., Sir Wm. Armstrong, Whitworth and Co., Ltd., Wm. Beardmore and Sons, Ltd., Short Bros., Ltd., and Airships, Ltd. The technical department of each of these great firms has contributed an article of great interest, each on an entirely different phase of the subject.

Authorities on airships in various countries have kindly furnished figures concerning their national ships. Altogether, the Special Airship Number of THE AEROPLANE will contain more information about airships than has been collected within the covers of one publication since the first Airship Number of THE AEROPLANE was published in 1916.

As newsagents are not, as a rule, interested in aeronautics, those who want to make sure of securing a copy of the Airship Number are advised to order it in advance from "The Aeroplane" Publishing Dept., 61, Carey Street, W.C.2. The price is 9d. post free.

As usual we are losing our opportunities. Here is the first International Aeronautical Exhibition since the war, and there is not a single seaplane on view or in use, except a couple of machines built in Holland from parts of German machines fished out of the North Sea, and one F.5 flying-boat, built by the Gosport Co., flown to Amsterdam, not flown during the show for reasons which will be explained later, and moored out in Het Ij where it cannot be seen except from passing boats and where it cannot be inspected at all.

That apparently is our typically British way of getting business. One hardly knows whether it is the fault of the Air Ministry or of the Society of British Aircraft Constructors or of the individual aircraft firms. Probably the fault is divisible among all of them in variable degrees.

To Whom the Blame?

The individual seaplane firms are certainly to blame for not following the obviously sensible policy of being first in the first of the world's open markets since the war. But one cannot be sure of how much hindrance has been put in the way of the Trade by the Air Ministry, so perhaps the fault is not altogether that of the individual firm.

The S.B.A.C. is certainly to blame for not encouraging the Trade to exhibit at Amsterdam. Of course one can quite understand that the S.B.A.C. wants its own first show in London to be the greatest thing that ever happened. But even if that show is to occupy the whole of the Crystal Palace, or if Hyde Park is to be covered with marquees for the occasion, that will not bring to London the actual individual buyers who would buy seaplanes at their own doors if the machines were brought there, and if they had the practical value of the seaplane demonstrated by a successful joy-ride service. The policy, or lack of policy (whichever it may be) of the S.B.A.C. is short-sighted and small-minded. One had hoped for better things from a combination of men who were so successful in war-time. But peace is ever a more serious test of ability than is war.

The Air Ministry's Part.

Just what the Air Ministry has done to help British industry in this market is precisely nothing. One hears that the Ministry may perhaps send a high official to Holland to "talk pretty" to those Hollanders who are becoming so keenly interested in aeronautics. But what the Ministry is *going* to do matters rather less than what it *has* done. And anyhow we have had more than enough pretty talk from the Civil Aviation Department. In fact most of us are becoming rather nauseated by it. And in any case we want something done.

So far the Ministry has kindly permitted the Gosport Aviation Co. to fly a boat to Amsterdam—as already stated. And that seems to be the net amount of help given.

It is true that the boat is some day to become the property of the R.A.F., and so it is desirable that it should not be worn out before it is delivered. But it seems purely imbecile to forbid the Gosport Co. from flying it at all during its visit to Holland. Considering that the R.A.F. has some dozens of boats sitting in sheds at Felixstowe, minus wings, rusting and drying to death (a boat hull must be kept in water or it becomes dangerous), it is fairly futile to talk such a lot about helping aviation and then do nothing to help.

If the Air Ministry had had any common sense at all, it would have started a regular flying-boat service between Harwich and Amsterdam, via Ijmuiden, for the benefit of those concerned with the Exhibition, and any others who might care to pay the price to use it.

A Great Chance.

There is no more objection to the R.A.F. running a flying-boat service than there is to the State running the railways, and, badly organised as the R.A.F. may be, it could not possibly make as big a mess of such a service as the State has made of the railway and telephone services since it took them over. In fact the flying-boat people have done such good work in the past that they would probably run a line to Holland extremely well.

One has been told by one of the ablest of our seaplane officers that the R.A.F. flying-boats have flown more than a million (1,000,000) miles without a fatal incident, and this despite the fact that by far the greater part of this flying was done in time of war, when people flew in weather in which they would not have flown in peace-time. Surely such a record should encourage the Air Ministry to start a regular service to Holland at once.

We hear a lot about "blazing the trail" for Civil Aviation, and we hear of silly voyages to India and Central Africa, which cost thousands of pounds and merely demonstrate that an aeroplane is slower than a camel, and yet the Air Ministry lacks the common gumption to blaze the trail by opening an experimental service which is not only bound to be a technical success, but might with very little luck pay its way.

A Paying Proposition.

The fare from London to Amsterdam is roughly six pounds. With all incidentals thrown in there is not much change out of ten pounds. And the journey takes twenty-four hours, the Zeeland boats being skilfully timed so that one has to spend an uncomfortable night on board at the price of a super-Ritz for accommodation. Besides which there is all the annoyance and fatigue of the passport formalities on the quays at Folkestone and Flushing.

Anybody who wanted to go to or from Amsterdam in a hurry would gladly pay £15 or £20 for a flight across the North Sea and a quick railway journey between London and Harwich.

Let the much-advertised Civil Aviation Department of the Air Ministry work it out and see whether it could not make enough out of fares at that rate to pay at least for petrol and wear-and-tear of boats and engines. If it could do so it would be more than justified in running the service, for it would then provide its pilots and mechanics with plenty of practice at no more cost than that of their pay and maintenance, it would confer a benefit on the business community, and it would do a very great deal to develop Civil Aviation.

But of course it would be asking far too much of the Civil Aviation Department to expect it to wrestle with the Air Ministry as a whole to achieve three such desirable objects. The only object of the Department so far seems to be to provide restful places for incompetent officials and to talk without acting. Its motto might well be "*Verba non res.*"

A Brilliant Act.

Another brilliant act of the Air Ministry was forbidding the Boulton & Paul "Bourges" biplane from going to Amsterdam, where its fine performance and magnificent workmanship would have materially enhanced the reputation of British aircraft on the Continent. Just what right the Air Ministry had to exercise its predilection for Prussianism one cannot quite understand.

One is told on quite good authority—though not by anyone concerned with the B. & P. firm (this explanation is necessary in view of possible official reprisals)—that the Air Ministry has neither paid for, bought, nor even ordered the "Bourges" which it was proposed to send to Amsterdam. Also, it was designed by Mr. J. D. North and not by the Technical Department, whom none would suspect of doing anything so intelligent, so that there is not even the excuse that it is a machine of Government design, so what earthly or aeronautical reason can there be for prohibiting its exhibition?

AIRCRAFT DISPOSAL DEPARTMENT

WYTON AERODROME, HUNTS.

Area about 198½ acres.

For disposal as a whole, or the buildings and land on which they stand, without the Aerodrome itself. The Buildings are of reinforced plaster, brick, corrugated iron and wood. There is a Water Supply, Electric Light Supply and Sewage Disposal. Tarmac road. In addition to its use as an

AERODROME

the buildings are suitable for

FACTORY, STORAGE, SANATORIUM, TRAINING INSTITUTION,

and many other similar purposes.

The site is occupied by the Government under the Defence of the Realm Regulations, and can (if necessary) be purchased under and subject to the provisions of the Defence of the Realm (Acquisition of Lands) Act, 1916.

For further particulars apply to the Disposal Board, Room 135, Charing Cross Buildings, Villiers Street, London, W.C.2.

NOTE.—For "SURPLUS," the detailed list of surplus Government property for sale, apply at the nearest bookstall or to the Director of Publicity, Ministry of Munitions, Whitehall Place, London, S.W.1. Price 3d

When such things happen one can understand the belief held by many people that the Air Ministry is trying to play the old game of the Department of Military Aeronautics when it tried to make aircraft design a Government monopoly and tried to make aeroplane production the job of a few "tame" or "favoured" firms. Personally one ascribes all the Air Ministry's actions up to the present merely to congenital imbecility. In this instance it is probably inspired by a foolish idea that it is really protecting the safety of the Empire by preventing undesirable aliens from seeing our newest designs.

A Simple Lesson.

One commends to the Air Ministry the saying of a great American manufacturer some 25 years ago. One happened to be showing him round a certain big British factory, the head of which was more enlightened than his contemporaries and did not believe in the usual British policy of silly secrecy. Being very young, one remarked to the American that he was highly privileged to be allowed to see over our excellent works. The American replied quite simply that he always made a point of showing his rivals all his latest productions, because they talked about them and so gave him the best possible advertisement, and if they saw anything in his works worth copying, and managed to copy it in time to compete with him, that merely showed that his ideas were out of date and it was time for him to think and act more quickly.

Not only the Air Ministry but the Aircraft Industry might well profit by that simple lesson. By showing the World our best we increase the World's respect for us. And if other nations can produce machines as good before we have produced something better it is proof positive that we are not progressing as we should.

An Imbecile Policy.

Perhaps the most imbecile of all the imbecile things which we have done in connection with the Amsterdam Show was to bring pressure to bear on the Hollanders to prevent the Germans from showing aeroplanes there. Such action on our part must have seemed an obvious confession of weakness.

Surely if our machines are better than those of the Germans we have every reason to profit by putting the two side by side. As a matter of fact we should have scored immensely by having German machines there. The Royal Netherlands Flying Corps had several Hun aeroplanes, and there were three Fokkers, evidently built in Germany, but they could not in the least compete with their "opposite number" the Bantam Bat. And the bigger Hun machines would have compared equally badly in the eyes of a Hollander with Aircos, H.Ps., and Vickerses.

None knows what is good work and what is not so well as does the Hollander, whose own work in everything he touches is a marvel of finish and craftsmanship. We have lost yet another opportunity by thus barring German machines, besides giving the World an impression of our small-minded meanness to a beaten foe.

Perhaps some more imaginative person than oneself can give some reasonable explanation of why Hun machines were boycotted. For oneself one fails entirely to imagine why a neutral country should thus become partisan *after the war*.

An Extraordinary Official.

Before closing these few kind remarks on the Air Ministry one would like to refer to one Government official who deserves a paragraph to himself. One does not know his name, nor his rank, but he is a Customs official at Hounslow, and one is told that he is doing everything in his power to help Civil Aviation by doing his job courteously and efficiently. He is said to simplify formalities and to explain difficulties most pleasingly. And he is even reported to have wished aerial travellers good luck on their journey. One hopes that this testimonial will not damage his career under the Air Ministry, but he is so unusual that one feels that he deserves notice. Perhaps, though, he is a real Custom-House officer, in which case he is perhaps not so exceptional and may be able to continue his career of usefulness. Would that there were more like him.

On the whole we have lost some fine opportunities at Amsterdam, but none which we cannot regain if we act at once. There is, however, no such chance. Having thus emphasised our defects in large print, according to custom, one now proposes, for the benefit of those who are not already bored with the subject, to set forth in smaller print some of the really good things which British Aircraft have done at the Amsterdam Aero Show.

AT THE AMSTERDAM AERO SHOW.

The Amsterdam Show is known all over Holland as the Elta. The letters stand for Eerste Luchtvaart Tentoonstellings Amsterdam, otherwise First Airtravel Exhibition, Amsterdam. Never has one seen an exhibition so well advertised, and never has one seen a whole country so interested in an exhibition. The word Elta is about as familiar in Holland to-day as the words Kaas or Bier. Truly, the Amsterdammer is a fine commercial man, and well worth cultivating.

Holland to-day is probably the richest country in the world per head of population, thanks to the war, and now in time of peace, Holland is growing still richer, as the *entrepot* between England and Germany. Holland is at present making England pay for Van Tromp's ships sunk some hundreds of years ago, and in making Germany pay for the Batavia Liners sunk a year or two or three ago.

The method is quite simple. Everything is charged in things that look like francs on a bill, and become florins (commonly called gelder) in practice. One thinks in tuppences and pays in two-shilling pieces. As one remarked at the beginning of this article, the Hollanders are a great commercial people.

Owing to this plan everything in Holland costs exactly twice what it costs in London to-day, which is to say that it costs just four times the pre-war price. And so the Hollands merchant does well.

Against this predatory habit one sets the fact that the Hollander is one of the best fellows in the world. He is most hospitable, he is wonderfully good-tempered, and he is good to behold. So is she, especially the last.

Amsterdam is what London might be if it had a County Council which possessed civic pride instead of a passion for

politics, and if it were planted on the site of Venice. That is to say, it is the cleanest city in the world, full of the most beautiful buildings, and it lives on its canals. It is the handsomest city one has seen.

The people look like advertisements for somebody's health-salts, though how they retain their complexions and figures along with their appetites is one of the Wonders of the World. Presumably, their energy absorbs the vast amount of fuel they consume, and keeps them fit. Surely the Hollander must be the healthiest person in the world, as well as one of the best.

The most astonishing thing about the Amsterdammer is that he looks so English. One can walk all over the place without seeing anyone who "looks foreign," as we should say in England. The Hollander dresses well but not stylishly, and one might fancy oneself in Manchester (minus its dirt and its poor) if one glanced at an Amsterdam crowd, but one would never think oneself in Piccadilly.

The Hollander being what he is, as mentioned herebefore, it was natural that the Elta should be a success, for it interests the business man, and the sportsman equally. And so Holland goes to the Elta in its thousands.

At the Elta Aerodrome.

One arrived in Amsterdam too late for the "Oopeningsplechtigheid" (or opening ceremony)—a lovely word that. Anyhow, one was told that the "opening splash" did not signify much, because the real ceremony was being kept for Captain Sir John Alcock, K.B.E., D.S.C., who was the distinguished guest of the Elta Committee on Sunday. And certainly Sir John got a reception. It is demonstrably true that it was far better organised officially and spontaneously bigger than that which he received in London. You see there was no preliminary anti-climax nor ill-judged newspaper booming to spoil the effect. The Netherlands newspapers merely announced that the man who had flown the Atlantic was coming to Amsterdam at a certain hour, and the people flocked in their tens of thousands to greet him.

A Dutch welcome is really rather a terrifying proceeding, for it involves lunches and banquets and healths innumerable. And Dutch hospitality is of the most lavish kind. After about three days of it one could see the British guests swelling visibly, and after five days one gallant lieutenant-colonel, R.A.F., said that on the next morning he had to be led by the hand along the corridor of his hotel because he was so stodged with food that he could not see out of his eyes. Which expressed very well what all of the visitors felt.

On arrival at the Elta aerodrome, Sir John Alcock, Captain Acland, of Vickers, Ltd., and all the other British visitors were entertained to lunch by the Elta committee, with General Snyders in the chair. Next to the magnificence of the lunch the most striking thing was the fact that all the speeches—which were interlarded between the courses—were delivered in excellent English. The upper class Hollander seems to speak English, French, and German with as much fluency as his own expressive tongue—which probably explains Holland's success in business.

In the evening everybody was entertained to dinner by the Nethmy—which stands for Nederlands-Englisch-Technich-Handels-Maatschapij—which is the Dutch Vickers Co., and that was as fine an affair as the lunch. Next day everybody who had been there looked like it. After that there were private or business entertainments of one sort or other every day.

Flying to Holland.

The Elta aerodrome itself was vile, considered as an aerodrome surface, but it is excellently situated, dead flat, free from obstructions all round, and of a size adequate for the biggest machines. In reality it is a splendid testimony to the energy of the Hollanders, for a few weeks ago it was just a stretch of bog, thinly covered with sand and patches of skinny-looking grass here and there. By the time the Elta opened it was quite serviceable for light and medium machines, but the big ones such as the H.P.'s and Vimy's bogged up to the axles every time they landed, until the pilots learned to know the hard spots by name. When the surface has been properly doctored it should be one of the best and most important of the famous aerodromes of the world.

At the beginning of the show Herr Fokker had the flying all to himself. German machines were barred from the show, it is true, but Herr Fokker, who became a naturalised German during the war, is now de-naturalised and is again a Nederlander, so of course he is entitled to show. On account of his skill as a pilot and of the fame of his machines in the war, and of his nationality, he was naturally the popular hero till the British machines began to arrive, and then he took a back seat several rows behind.

The First Arrival.

The first British machine to arrive by air, so far as one could gather, was a four-engined Handley Page, piloted by Major Douglas. By good luck it bogged without overturning, and was thereafter towed into one of the two big exhibition halls. Getting it into the hall necessitated pulling down telegraph wires, kiosks, offices, triumphal pillars, and eventually almost the whole front of the hall. And even when it was got inside it was only possible to open one wing, for it then extended the full width of the hall. However, it was better to show it with one wing folded, as an example of ingenious design.

A Fine Performance.

The next arrival was a Gosport flying-boat, which put up one of the most striking performances in the brief history of commercial aeronautics. This boat, an F.5, with Rolls-Royce engines, is an Air Ministry order, so, though the Ministry has not paid for it, the boat is under official control. By some wonderful effort of intelligence the Ministry allowed the firm to fly the boat to Amsterdam, but absolutely and utterly forbade the firm to fly it while there, except when it is flown away again.

Which, of course, is so useful as a means of demonstrating the usefulness of British aircraft. It would be like a cautious Hollander or any other business man to buy a boat which he was not allowed to try. The buyer's natural argument would be that if the boat is only fit to fly to Amsterdam and to fly away again, and is not fit for trial flights while there, it cannot be worth very much. But of course that is all in accord with the Civil Aviation Department's *blâgue* about "blazing the trail" for commercial aeronautics.

Anyhow, the flight was unusually fine. The boat left the Gos-

port Aviation Company's works at Southampton on Wednesday, July 31st, piloted by Lieut.-Col. Hope-Vere, R.A.F., and Lieut. Carnegie, R.A.F., carrying as passengers Dr. Bisschop (who brought the diplomatic mail with him), Mr. M. H. Volk (manager of the Gosport Co.), Mr. Nicholson (son of Mr. Charles Nicholson, the famous yacht builder), and an engineer. They followed the British coast to Beachy Head, crossed thence to Gris Nez, and so along the French, Belgian, and Nederlands coast to Ijmuiden, whence they followed the ship canal to Amsterdam, where they arrived at 8.25 p.m.

Southampton to Amsterdam non-stop in 5 hours and 35 minutes is a splendid demonstration of the value of the flying-boat for international communication. Incidentally the boat carried the London morning papers, which thus reached Holland for the first time on the day of publication, in spite of going all the way to Southampton.

After its arrival the boat was moored out in the Ij, where it was only visible at a distance to those who went to the Elta by boat instead of by road and ferry. And, presumably because it is a Government order, there was no advertisement on it to proclaim its performance, or the fact that it was made by the Gosport Co. Thus do we English hide our lights under many bushels.

The Pride of Holland.

The Hollanders themselves were filled with pride when the F.K.26 Bat arrived, piloted by Major Draper, and carrying Mr. and Mrs. Koolhoven, and the invaluable "Tom" (Mr. Koolhoven's chief aerodrome engineer) as passengers. As they emerged from the big black and white machine with their many suit-cases, rugs, coats, spare tyres and so forth, the crowd waxed joyful at this example of aerial "tourism," and the Amsterdam Press quite let itself go on the subject, even to the extent of pulling Mr. Koolhoven's leg and reminding him that as a motor-racing hero he was popularly known as Fritz before he became a naturalised Englishman and took to calling himself Frederick.

But Holland's pride in Mr. Koolhoven grew exceedingly when a Bantam Bat with the 170 A.B.C. engine arrived, piloted by Mr. Duke, late Lieut., R.A.F., and proceeded to show Amsterdammers real flying for the first time. Mr. Duke has beautiful hands for a fast machine, and he did everything that a first-class scout pilot can do—which is rather wonderful considering that he spent the last year of the war as a prisoner in Germany.
